

## LM2704 Micropower Step-up DC/DC Converter with 550mA Peak Current Limit

Check for Samples: [LM2704](#)

### FEATURES

- 550mA, 0.7Ω, Internal Switch
- Uses Small Surface Mount Components
- Adjustable Output Voltage up to 20V
- 2.2V to 7V Input Range
- Input Undervoltage Lockout
- 0.01μA Shutdown Current
- Small 5-Lead SOT-23 Package

### APPLICATIONS

- LCD Bias Supplies
- White LED Back-Lighting
- Handheld Devices
- Digital Cameras
- Portable Applications

### DESCRIPTION

The LM2704 is a micropower step-up DC/DC in a small 5-lead SOT-23 package. A current limited, fixed off-time control scheme conserves operating current resulting in high efficiency over a wide range of load conditions. The 21V switch allows for output voltages as high as 20V. The low 400ns off-time permits the use of tiny, low profile inductors and capacitors to minimize footprint and cost in space-conscious portable applications. The LM2704 is ideal for LCD panels requiring low current and high efficiency as well as white LED applications for cellular phone back-lighting. The LM2704 can drive up to 8 white LEDs from a single Li-Ion battery.

### Typical Application Circuit

$C_{IN}$ : Taiyo Yuden Ceramic  
 $C_{OUT}$ : Taiyo Yuden Ceramic  
L: Coilcraft DO1608C-103  
D: Motorola MBRM130LT3

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

## Connection Diagram

The maximum allowable power dissipation is a function of the maximum junction temperature,  $T_{J(MAX)}$ , the junction-to-ambient thermal resistance,  $\theta_{JA}$ , and the ambient temperature,  $T_A$ . See the Electrical Characteristics table for the thermal resistance. The maximum allowable power dissipation at any ambient temperature is calculated using:  $P_D (MAX) = (T_{J(MAX)} - T_A)/\theta_{JA}$ . Exceeding the maximum allowable power dissipation will cause excessive die temperature.

**Figure 1. SOT23-5 - Top View**  
 $T_{Jmax} = 125^{\circ}C$ ,  $\theta_{JA} = 220^{\circ}C/W$

### PIN DESCRIPTIONS

Pin	Name	Function
1	SW	Power Switch input.
2	GND	Ground.
3	FB	Output voltage feedback input.
4	$\overline{SHDN}$	Shutdown control input, active low.
5	$V_{IN}$	Analog and Power input.

**SW(Pin 1):** Switch Pin. This is the drain of the internal NMOS power switch. Minimize the metal trace area connected to this pin to minimize EMI.

**GND(Pin 2):** Ground Pin. Tie directly to ground plane.

**FB(Pin 3):** Feedback Pin. Set the output voltage by selecting values for R1 and R2 using:

$$R1 = R2 \left( \frac{V_{OUT}}{1.237V} - 1 \right) \quad (1)$$

Connect the ground of the feedback network to an AGND plane which should be tied directly to the GND pin.

**$\overline{SHDN}$ (Pin 4):** Shutdown Pin. The shutdown pin is an active low control. Tie this pin above 1.1V to enable the device. Tie this pin below 0.3V to turn off the device.

**$V_{IN}$ (Pin 5):** Input Supply Pin. Bypass this pin with a capacitor as close to the device as possible.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

**Absolute Maximum Ratings<sup>(1)(2)</sup>**

V <sub>IN</sub>	7.5V
SW Voltage	21V
FB Voltage	2V
$\overline{\text{SHDN}}$ Voltage	7.5V
Maximum Junction Temp. T <sub>J</sub> <sup>(3)</sup>	150°C
Lead Temperature (Soldering 10 sec.)	300°C
Vapor Phase (60 sec.)	215°C
Infrared (15 sec.)	220°C
ESD Ratings <sup>(4)</sup>	
Human Body Model	2kV
Machine Model <sup>(5)</sup>	200V

- (1) Absolute maximum ratings are limits beyond which damage to the device may occur. Operating Ratings are conditions for which the device is intended to be functional, but device parameter specifications may not be ensured. For ensured specifications and test conditions, see the Electrical Characteristics.
- (2) If Military/Aerospace specified devices are required, please contact the TI Sales Office/Distributors for availability and specifications.
- (3) The maximum allowable power dissipation is a function of the maximum junction temperature, T<sub>J</sub>(MAX), the junction-to-ambient thermal resistance,  $\theta_{JA}$ , and the ambient temperature, T<sub>A</sub>. See the Electrical Characteristics table for the thermal resistance. The maximum allowable power dissipation at any ambient temperature is calculated using: P<sub>D</sub>(MAX) = (T<sub>J</sub>(MAX) – T<sub>A</sub>)/ $\theta_{JA}$ . Exceeding the maximum allowable power dissipation will cause excessive die temperature.
- (4) The human body model is a 100 pF capacitor discharged through a 1.5 k $\Omega$  resistor into each pin. The machine model is a 200 pF capacitor discharged directly into each pin.
- (5) ESD susceptibility using the machine model is 150V for SW pin.

**Operating Conditions**

Junction Temperature <sup>(1)</sup>	-40°C to +125°C
Supply Voltage	2.2V to 7V
SW Voltage Max.	20.5V

- (1) All limits ensured at room temperature (standard typeface) and at temperature extremes (bold typeface). All room temperature limits are 100% production tested or ensured through statistical analysis. All limits at temperature extremes are ensured via correlation using standard Statistical Quality Control (SQC) methods. All limits are used to calculate Average Outgoing Quality Level (AOQL).

**Electrical Characteristics<sup>(1)</sup>**

Specifications in standard type face are for T<sub>J</sub> = 25°C and those in **boldface type** apply over the full **Operating Temperature Range** (T<sub>J</sub> = -40°C to +125°C). Unless otherwise specified. V<sub>IN</sub> = 2.2V.

Symbol	Parameter	Conditions	Min <sup>(1)</sup>	Typ <sup>(2)</sup>	Max <sup>(1)</sup>	Units
I <sub>Q</sub>	Device Disabled	FB = 1.3V		40	<b>70</b>	$\mu$ A
	Device Enabled	FB = 1.2V		235	<b>300</b>	
	Shutdown	$\overline{\text{SHDN}} = 0V$		0.01	2.5	
V <sub>FB</sub>	Feedback Trip Point		<b>1.189</b>	1.237	<b>1.269</b>	V
I <sub>CL</sub>	Switch Current Limit		490 <b>420</b>	550	610 <b>620</b>	mA
I <sub>B</sub>	FB Pin Bias Current	FB = 1.23V <sup>(3)</sup>		30	<b>120</b>	nA
V <sub>IN</sub>	Input Voltage Range		<b>2.2</b>		<b>7.0</b>	V
R <sub>DSON</sub>	Switch R <sub>DSON</sub>			0.7	<b>1.6</b>	$\Omega$
T <sub>OFF</sub>	Switch Off Time			400		ns

- (1) All limits ensured at room temperature (standard typeface) and at temperature extremes (bold typeface). All room temperature limits are 100% production tested or ensured through statistical analysis. All limits at temperature extremes are ensured via correlation using standard Statistical Quality Control (SQC) methods. All limits are used to calculate Average Outgoing Quality Level (AOQL).
- (2) Typical numbers are at 25°C and represent the most likely norm.
- (3) Feedback current flows into the pin.

### Electrical Characteristics<sup>(1)</sup> (continued)

Specifications in standard type face are for  $T_J = 25^\circ\text{C}$  and those in **boldface type** apply over the full **Operating Temperature Range** ( $T_J = -40^\circ\text{C}$  to  $+125^\circ\text{C}$ ). Unless otherwise specified.  $V_{IN} = 2.2\text{V}$ .

Symbol	Parameter	Conditions	Min (1)	Typ (2)	Max (1)	Units
$I_{SD}$	$\overline{\text{SHDN}}$ Pin Current	$\overline{\text{SHDN}} = V_{IN}$ , $T_J = 25^\circ\text{C}$		0	80	nA
		$\overline{\text{SHDN}} = V_{IN}$ , $T_J = 125^\circ\text{C}$		15		
		$\overline{\text{SHDN}} = \text{GND}$		0		
$I_L$	Switch Leakage Current	$V_{SW} = 20\text{V}$		0.05	5	$\mu\text{A}$
UVP	Input Undervoltage Lockout	ON/OFF Threshold		1.8		V
$V_{FB}$ Hysteresis	Feedback Hysteresis			8		mV
$\overline{\text{SHDN}}$ Threshold	$\overline{\text{SHDN}}$ low			0.7	<b>0.3</b>	V
	$\overline{\text{SHDN}}$ High		<b>1.1</b>	0.7		
$\theta_{JA}$	Thermal Resistance			220		$^\circ\text{C}/\text{W}$

Typical Performance Characteristics

**Step Response**

$V_{OUT} = 20V$ ,  $V_{IN} = 3.0V$   
 1) Load, 1mA to 17mA to 1mA, DC  
 2)  $V_{OUT}$ , 200mV/div, AC  
 3)  $I_L$ , 500mA/div, DC  
 $T = 40\mu s/div$

**Start-Up/Shutdown**

$V_{OUT} = 20V$ ,  $V_{IN} = 2.5V$   
 1)  $\overline{SHDN}$ , 1V/div, DC  
 2)  $I_L$ , 250mA/div, DC  
 3)  $V_{OUT}$ , 20V/div, DC  
 $T = 400\mu s/div$   
 $R_L = 1.3k\Omega$

## OPERATION

**Figure 2. LM2704 Block Diagram**

$V_{OUT} = 20V$ ,  $V_{IN} = 2.5V$   
 1)  $V_{SW}$ , 20V/div, DC  
 2) Inductor Current, 500mA/div, DC  
 3)  $V_{OUT}$ , 100mV/div, AC  
 $T = 10\mu s/div$

**Figure 3. Typical Switching Waveform**

The LM2704 features a constant off-time control scheme. Operation can be best understood by referring to [Figure 2](#) and [Figure 3](#). Transistors Q1 and Q2 and resistors R3 and R4 of [Figure 2](#) form a bandgap reference used to control the output voltage. When the voltage at the FB pin is less than 1.237V, the Enable Comp in [Figure 2](#) enables the device and the NMOS switch is turned on pulling the SW pin to ground. When the NMOS switch is on, current begins to flow through inductor L while the load current is supplied by the output capacitor  $C_{OUT}$ . Once the current in the inductor reaches the peak current limit, the CL Comp trips and the 400ns One Shot

turns off the NMOS switch. The SW voltage will then rise to the output voltage plus a diode drop and the inductor current will begin to decrease as shown in [Figure 3](#). During this time the energy stored in the inductor is transferred to C<sub>OUT</sub> and the load. After the 400ns off-time the NMOS switch is turned on and energy is stored in the inductor again. This energy transfer from the inductor to the output causes a stepping effect in the output ripple as shown in [Figure 3](#).

This cycle is continued until the voltage at FB reaches 1.237V. When FB reaches this voltage, the enable comparator then disables the device turning off the NMOS switch and reducing the I<sub>q</sub> of the device to 40uA. The load current is then supplied solely by C<sub>OUT</sub> indicated by the gradually decreasing slope at the output as shown in [Figure 3](#). When the FB pin drops slightly below 1.237V, the enable comparator enables the device and begins the cycle described previously. The SHDN pin can be used to turn off the LM2704 and reduce the I<sub>q</sub> to 0.01μA. In shutdown mode the output voltage will be a diode drop lower than the input voltage.

## APPLICATION INFORMATION

### INDUCTOR SELECTION

The appropriate inductor for a given application is calculated using the following equation:

$$L = \left( \frac{V_{OUT} - V_{IN(min)} + V_D}{I_{CL}} \right) T_{OFF} \quad (2)$$

where V<sub>D</sub> is the schottky diode voltage, I<sub>CL</sub> is the switch current limit found in the [Typical Performance Characteristics](#) section, and T<sub>OFF</sub> is the switch off time. When using this equation be sure to use the minimum input voltage for the application, such as for battery powered applications. For the LM2704 constant-off time control scheme, the NMOS power switch is turned off when the current limit is reached. There is approximately a 200ns delay from the time the current limit is reached in the NMOS power switch and when the internal logic actually turns off the switch. During this 200ns delay, the peak inductor current will increase. This increase in inductor current demands a larger saturation current rating for the inductor. This saturation current can be approximated by the following equation:

$$I_{PK} = I_{CL} + \left( \frac{V_{IN(max)}}{L} \right) 200ns \quad (3)$$

Choosing inductors with low ESR decrease power losses and increase efficiency.

Care should be taken when choosing an inductor. For applications that require an input voltage that approaches the output voltage, such as when converting a Li-Ion battery voltage to 5V, the 400ns off time may not be enough time to discharge the energy in the inductor and transfer the energy to the output capacitor and load. This can cause a ramping effect in the inductor current waveform and an increased ripple on the output voltage. Using a smaller inductor will cause the I<sub>PK</sub> to increase and will increase the output voltage ripple further. This can be solved by adding a 4.7pF capacitor across the R<sub>F1</sub> feedback resistor ([Figure 2](#)) and slightly increasing the output capacitor. A smaller inductor can then be used to ensure proper discharge in the 400ns off time.

### DIODE SELECTION

To maintain high efficiency, the average current rating of the schottky diode should be larger than the peak inductor current, I<sub>PK</sub>. Schottky diodes with a low forward drop and fast switching speeds are ideal for increasing efficiency in portable applications. Choose a reverse breakdown of the schottky diode larger than the output voltage.

### CAPACITOR SELECTION

Choose low ESR capacitors for the output to minimize output voltage ripple. Multilayer ceramic capacitors are the best choice. For most applications, a 1μF ceramic capacitor is sufficient. For some applications a reduction in output voltage ripple can be achieved by increasing the output capacitor.

Local bypassing for the input is needed on the LM2704. Multilayer ceramic capacitors are a good choice for this as well. A 4.7μF capacitor is sufficient for most applications. For additional bypassing, a 100nF ceramic capacitor can be used to shunt high frequency ripple on the input.

## LAYOUT CONSIDERATIONS

The input bypass capacitor  $C_{IN}$ , as shown in [Typical Application Circuit](#), must be placed close to the IC. This will reduce copper trace resistance which effects input voltage ripple of the IC. For additional input voltage filtering, a 100nF bypass capacitor can be placed in parallel with  $C_{IN}$  to shunt any high frequency noise to ground. The output capacitor,  $C_{OUT}$ , should also be placed close to the IC. Any copper trace connections for the Cout capacitor can increase the series resistance, which directly effects output voltage ripple. The feedback network, resistors R1 and R2, should be kept close to the FB pin to minimize copper trace connections that can inject noise into the system. The ground connection for the feedback resistor network should connect directly to an analog ground plane. The analog ground plane should tie directly to the GND pin. If no analog ground plane is available, the ground connection for the feedback network should tie directly to the GND pin. Trace connections made to the inductor and schottky diode should be minimized to reduce power dissipation and increase overall efficiency.

### REVISION HISTORY

Changes from Revision C (May 2013) to Revision D	Page
• Changed layout of National Data Sheet to TI format .....	11

**PACKAGING INFORMATION**

Orderable part number	Status (1)	Material type (2)	Package   Pins	Package qty   Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
<a href="#">LM2704MF-ADJ/NOPB</a>	Active	Production	SOT-23 (DBV)   5	1000   LARGE T&R	Yes	SN	Level-1-260C-UNLIM	-40 to 125	S28B
LM2704MF-ADJ/NOPB.Z	Active	Production	SOT-23 (DBV)   5	1000   LARGE T&R	Yes	SN	Level-1-260C-UNLIM	-40 to 125	S28B

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
