

# BQ25185 パワー・パス、ファクトリ・モード、バッテリー・トラッキング VINDPM 付き 1 セル、1A スタンドアロン・リニア・バッテリー・チャージャ

## 1 特長

- 1A リニア・バッテリー・チャージャ
  - 3.0V ~ 18V の入力電圧動作範囲
  - 許容入力電圧 25V
  - 外付け抵抗でプログラム可能な動作:
    - ILIM/VSET でバッテリー・レギュレーション電圧を 3.6V、3.65V、4.02V、4.1V、4.2V、4.35V、4.4V に設定
    - ILIM/VSET で入力電流制限を 100mA、500mA、1100mA に設定
    - ISET による充電電流の設定 (5mA ~ 1A)
  - リチウムイオン電池、リチウムポリマー電池、LiFePO4 電池をサポート
  - 115mΩ バッテリー FET オン抵抗
  - 最大 3.125A の放電電流で高いシステム負荷に対応
- システム電源およびバッテリー充電用のパワー・パス管理
  - 4.5V でレギュレートされたシステム電圧 (SYS)
  - 設定可能な入力電流制限
  - USB サスペンドモードをサポート
  - ハイ・インピーダンス入力ソース用のバッテリー・トラッキング入力電圧ダイナミック・パワー・マネージメント (VINDPM)
  - 動的なパワー・パス管理により、弱いアダプタからの充電を最適化
- 非常に低い静止電流
  - 4μA バッテリー単独モード
  - 30μA 入力アダプタ Iq (スリープ・モード)
  - 出荷モードで 3.2μA のバッテリー放電電流
- フォルト保護機能内蔵
  - 入力過電圧保護 (VIN\_OVP)
  - バッテリー低電圧保護 (BUVLO)
  - バッテリー短絡保護 (BATSC)
  - バッテリー過電流保護 (BATOCP)
  - 入力電流制限保護 (ILIM)
  - サーマル・レギュレーション (TREG) およびサーマル・シャットダウン (TSHUT)
  - バッテリー過熱フォルト保護 (TS)
  - 安全タイマ・フォルト
  - ISET および ILIM/VSET ピンの短絡 / 開放保護。

## 2 アプリケーション

- TWS ヘッドセットと充電ケース
- スマート眼鏡、AR、VR
- スマート・ウォッチ、その他のウェアラブル・デバイス
- リテール・オートメーションおよびペイメント
- ビル・オートメーション

## 3 概要

BQ25185 は、小さなソリューション・サイズと、バッテリー寿命を延長するための低い静止電流に重点を置いたリニア・バッテリー・チャージャ IC です。このデバイスは、放熱性能を高めるサーマル・パッド付きのリードレス小型パッケージで供給されます。このデバイスは、最大 1A の充電および最大 3.125A のシステム負荷をサポートできます。

### パッケージ情報

| 部品番号    | パッケージ (1)      | パッケージ・サイズ (2) | 本体サイズ (公称)    |
|---------|----------------|---------------|---------------|
| BQ25185 | DLH (WSON, 10) | 2.2mm × 2.0mm | 2.2mm × 2.0mm |

- 利用可能なパッケージについては、このデータシートの末尾にある注文情報を参照してください。
- パッケージ・サイズ (長さ×幅) は公称値であり、該当する場合はピンも含まれます。

| October 2023 | *        | Initial Release |

## 5 概要 (続き)

バッテリーは、標準のリチウムイオンまたは LiFePO<sub>4</sub> 充電プロファイルを使用して、プリチャージ、定電流、定電圧の 3 つのフェーズで充電されます。サーマル・レギュレーションにより、デバイス温度を管理しながら最大充電電流を供給できます。また、このチャージャは、3V の最小入力電圧で動作するバッテリー間充電に最適化されており、25V の絶対最大ライン過渡電圧に耐えられます。このデバイスには、1 つの押しボタン入力が内蔵されているため、ソリューション全体の占有面積を減らすことができます。

## 6 Pin Configuration and Functions

図 6-1. DLH Package 10-Pin (top view)

表 6-1. Pin Functions

| Pin       |     | I/O <sup>(1)</sup> | Description                                                                                                                                                                                                                                                                                                                                                    |
|-----------|-----|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name      | NO. |                    |                                                                                                                                                                                                                                                                                                                                                                |
| IN        | 10  | P                  | DC input power supply. IN is connected to the external DC supply. Bypass IN to GND with at least 1 uF of capacitance using a ceramic capacitor.                                                                                                                                                                                                                |
| SYS       | 1   | P                  | Regulated system output. Connect at least 10uF ceramic capacitor (at least 1uF of ceramic capacitance with DC bias de-rating) from SYS to GND as close to the SYS and GND pins as possible.                                                                                                                                                                    |
| BAT       | 2   | P                  | Battery connection. Connect to the positive terminal of the battery. Bypass BAT to GND with at least 1uF of ceramic capacitance.                                                                                                                                                                                                                               |
| GND       | 5   | -                  | Ground connection. Connect to the ground plane of the circuit.                                                                                                                                                                                                                                                                                                 |
| ILIM/VSET | 7   | I/O                | Input current limit and battery regulation voltage program input. Refer to <a href="#">ILIM/VSET Control</a>                                                                                                                                                                                                                                                   |
| ISET      | 8   | I/O                | Fast charge current program input. We recommend an RC for small charge current values. Prefer to work only with one resistor.                                                                                                                                                                                                                                  |
| STAT1     | 9   | O                  | Open drain status output. Can be pulled up to 1- 20kohm resistor. Typical pull up voltage = 1.8V, Max pull up voltage = 5V. Refer to the Status Pins section for more details.                                                                                                                                                                                 |
| TS/MR     | 6   | I/O                | Manual reset input/ NTC thermistor pin. TS/MR is a general purpose input that must be held low for greater than $t_{LPRESS}$ to go into Factory mode. TS/MR may be driven by a momentary push-button or a MOS switch. The TS/MR pin can also have an NTC thermistor connected on to it. Refer to <a href="#">External NTC Monitoring Section (TS)</a> section. |
| CE        | 4   | I                  | Charge enable active-low input. Connect $\overline{CE}$ to a high logic level to disable charging. Connect to a low logic level to enable charging.                                                                                                                                                                                                            |
| STAT2     | 3   | O                  | Open drain status output. Can be pulled up to 1- 20kohm resistor. Typical pull up voltage = 1.8V, Max pull up voltage = 5V. Refer to the Status Pins section for more details.                                                                                                                                                                                 |

(1) I = Input, O = Output, I/O = Input or Output, G = Ground, P = Power.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

|                           |                      | MIN  | MAX   | UNIT |
|---------------------------|----------------------|------|-------|------|
| Input Voltage             | IN                   | -0.3 | 25    | V    |
| Voltage                   | All other pins       | -0.3 | 5.5   | V    |
| Input Current (DC)        | IN                   |      | 1.1   | A    |
| SYS Discharge Current(DC) | SYS                  |      | 3.125 | A    |
| Output Sink Current       | STAT1, STAT2         |      | 20    | mA   |
| T <sub>J</sub>            | Junction temperature | -40  | 150   | °C   |
| T <sub>stg</sub>          | Storage temperature  | -65  | 150   | °C   |

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 7.2 ESD Ratings

|                    |                         |                                                                                  | VALUE | UNIT |
|--------------------|-------------------------|----------------------------------------------------------------------------------|-------|------|
| V <sub>(ESD)</sub> | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins <sup>(1)</sup>     | ±2500 | V    |
|                    |                         | Charged device model (CDM), per ANSI/ESDA/ JEDEC JS-002, all pins <sup>(2)</sup> | ±1500 |      |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Thermal Information

| THERMAL METRIC <sup>(1)</sup> |                                                                | BQ25185 | UNIT |
|-------------------------------|----------------------------------------------------------------|---------|------|
|                               |                                                                | DLH     |      |
|                               |                                                                | 10      |      |
| R <sub>θJA</sub>              | Junction-to-ambient thermal resistance (JEDEC <sup>(1)</sup> ) | 68.3    | °C/W |
| R <sub>θJC(top)</sub>         | Junction-to-case (top) thermal resistance                      | 77.2    | °C/W |
| R <sub>θJB</sub>              | Junction-to-board thermal resistance                           | 34.7    | °C/W |
| Ψ <sub>JT</sub>               | Junction-to-top characterization parameter                     | 2.0     | °C/W |
| Ψ <sub>JB</sub>               | Junction-to-board characterization parameter                   | 34.7    | °C/W |
| R <sub>θJC(bot)</sub>         | Junction-to-case (bottom) thermal resistance                   | 10.7    | °C/W |

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

### 7.4 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|      |                                        | MIN | NOM | MAX   | UNIT |

## 8 Detailed Description

### 8.1 Overview

The BQ25185 integrates a linear charger that allows the battery to be charged with a resistor configurable charge current of up to 1 A. In addition to the charge current, other charging parameters can be programmed through external resistors such as battery regulation voltage and input current limit.

The power path allows the system to be powered from a regulated output, SYS, even when the battery is empty or charging, by drawing power from IN pin. It also prioritizes the system load in SYS, reducing the charging current, if necessary, in order support the load when input power is limited. If the input supply is removed and the battery voltage level is above  $V_{BUVLO}$ , SYS will automatically and seamlessly switch to battery power.

Charging is done through the internal battery MOSFET. There are several loops that influence the charge current: constant current loop (CC), constant voltage loop (CV), input current limit, thermal regulation, VDPPM, and VINDPM. During the charging process, all loops are enabled and the one that is dominant takes control.

The device supports multiple battery chemistries for single-cell applications, through adjustable battery regulation voltage regulation ( $V_{BATREG}$ ) and charge current ( $I_{CHG}$ ) options.

#### 8.1.1 Battery Charging Process

When a valid input source is connected ( $V_{IN} > V_{INDPM}$  and  $V_{BAT} + V_{SLEEP} < V_{IN} < V_{IN\_OVP}$ ), the state of the  $\overline{CE}$  pin and the TS/MR pin determines whether a charge cycle is initiated. When the  $\overline{CE}$  pin is set to disable charging,  $V_{HOT} < V_{TS/MR} < V_{COLD}$  and a valid input source is connected, the battery FET is turned off, preventing any kind of charging of the battery. Note that supplement behavior is independent of the  $\overline{CE}$  pin. The device will be able to charge a battery as long as VIN voltage is higher than the  $V_{INDPM}$  threshold. This threshold is present as the VIN can be considered "powergood" with a very low battery voltage or a 0-V battery.

The following figure illustrates a typical charge cycle.

**図 8-1. Charger Flow Diagram**

#### 8.1.1.1 Trickle Charge

In order to prevent damage to the battery, the device will charge the battery at a much lower current level known as trickle charge ( $I_{BATSC}$ ) when the battery voltage ( $V_{BAT}$ ) is below the  $V_{BATSC}$  threshold. During trickle charge, the device still counts against the precharge safety timer. Rather trickle charge and precharge are counting against the same duration of 25% of the fast charge timer.

### 8.1.1.2 Pre-Charge

When battery voltage is above the  $V_{BATSC}$  but lower than  $V_{LOWV}$  threshold, the battery is charged with the pre-charge current ( $I_{PRECHG}$ ). Pre-charge current is 2x the termination current (Section 8.1.1.5 Termination). As a result, the pre-charge current is 20 % of the fast charge current ( $I_{CHG}$ ).

When the battery voltage reaches the precharge to fast charge transition threshold ( $V_{LOWV}$ ), the device charges the battery at the fast charge current. If the device does not exit pre-charge within 25% of the fast charge safety timer, the device will stop charging. For more information on safety timers, see Section 8.3.7.7. Safety Timer.

### 8.1.1.3 Fast Charge

The charger has two main control loops that control charging when  $V_{BAT} > V_{LOWV}$ : the Constant Current (CC) and Constant Voltage (CV) loops. When the CC loop is dominant, typically when  $V_{BAT} < V_{BATREG} - V_{RCH}$ , the battery is charged at the maximum charge current level  $I_{CHG}$ , unless there is a TS fault condition, VINDPM is active, thermal regulation or DPPM is active. (See respective sections for details on these modes of operation). Once the battery voltage approaches the  $V_{BATREG}$  level, the CV loops becomes more dominant and the charging current starts tapering off as shown in Typical Charging Profile of a Battery. Once the charging current reaches the termination current ( $I_{TERM}$ ) the charge is done, then the STAT1 and STAT2 pins change to indicate a charge complete.

### 8.1.1.4 ISET Pin Detection

After valid VIN is plugged in and  $\overline{CE}$  pin is pulled LOW, the device checks the resistor on the ISET pin for shortcircuit ( $R_{ISET} < R_{ISET\_SHORT}$ ). If the condition is detected, charger remains in the FAULT state until the input or  $\overline{CE}$  pin are toggled. If the ISET pin is open-circuit, the charger will charge with very low charging current in the order of 1.5 mA. This pin is monitored while charging, and changes in  $R_{ISET}$  while the charger is operating will immediately translate to changes in charge current. An external pull-down resistor ( $\pm 1\%$  or better recommended to minimize charge current error) from ISET pin to GND sets the charge current as:

$$I_{CHG} = (K_{ISET}) / (R_{ISET}) \quad (1)$$

- $I_{CHG}$  is the desired fast charge current
- $K_{ISET}$  is a gain factor found in the electrical specification (typically 300 A $\Omega$ )
- $R_{ISET}$  is the pull-down resistor from ISET pin to GND

For charge currents below 50 mA, an extra RC circuit using a 50 pF capacitance is recommended on ISET to achieve more stable current signal. The ISET pin can also be used to monitor device current when the device is not in ICHG regulation. The voltage on the ISET pin is proportional to the device charging current. To measure the charge current when the device is charging, the following formula can be used:

$$I_{CHG} = (K_{ISET} V_{ISET}) / (R_{ISET}) \quad (2)$$

- $V_{ISET}$  is the measured voltage at the ISET pin in volts.
- $I_{CHG}$  is the calculated measured charge current

### 8.1.1.5 Termination

As the device CV loop becomes more dominate than the CC loop in fast charge operation, the charge current will taper and approach the  $I_{TERM}$  threshold. The device terminates at 10 % of  $I_{CHG}$ .

Once the  $I_{TERM}$  threshold is met during the CV phase, the device automatically terminates charge current by disabling the BATFET (disconnects the battery from SYS) to enter high impedance mode. If there is a regulation loop such as VINDPM, DPPM, or a thermal regulation loop that affects the charge current while the CV loop is tapering the charge current, termination will not occur. Charge current will continue to taper due to the active current affecting regulation loops and CV but the device will not terminate the charge current.

Termination only occurs when the CV loop is operating without any other regulation loops in effect that could reduce the charge current further. Post termination, the battery FET is disabled and the device monitors the BAT pin voltage. If the BAT pin voltage has dropped lower than the battery regulation voltage ( $V_{BATREG}$ ) by the recharge threshold ( $V_{RCH}$ ), a new charge cycle is started and safety timers are reset.

During charging or even when charge done, a higher SYS load will be supported through the supplement operation.

**図 8-2. Typical Charging Profile of a Battery**

## 8.2 Functional Block Diagram

## 8.3 Feature Description

### 8.3.1 Input Voltage Based Dynamic Power Management (VINDPM)

The VINDPM loop prevents the input voltage from collapsing to a point where charging would be interrupted. This is done by reducing the current drawn by charger enough to keep the input voltage above the VINDPM threshold ( $V_{INDPM}$ ).

During the normal charging process, if the input power source is not able to support the programmed or default charging current and System load, the supply voltage decreases. Once the supply drops to the  $V_{INDPM}$  threshold, the input DPM current and voltage loops will reduce the input current through the blocking FETs to prevent the further drop of the supply.

The VINDPM threshold is typically 300 mV above  $V_{BAT}$ . If the device is not operating in battery tracking VINDPM due to battery voltage, it will regulate the input to 3.6 V. Additionally, termination is disabled when VINDPM is active.

### 8.3.2 Dynamic Power Path Management Mode (DPPM)

With a valid input source connected, the power-path management circuitry monitors the input voltage and current continuously. The current into IN is shared at SYS between charging the battery and powering the system load at SYS. If the sum of the charging and load currents exceeds the preset maximum input current, the input DPM loop reduces input current. If SYS drops below the DPPM voltage threshold, the charging current is reduced by the DPPM loop through the BATFET. If SYS falls below the supplement mode threshold after BATFET charging current is reduced to zero, the part will enter supplement mode. SYS voltage is maintained above battery voltage when the DPPM loop is in control. Battery termination is disabled when the DPPM loop is active.

The VDPPM threshold is typically 100 mV above VBAT.

### 8.3.3 Battery Supplement Mode

While in DPPM mode, if the charging current falls to zero and the system load current increases beyond the programmed input current limit, the voltage at SYS reduces further. When the SYS voltage drops below the battery voltage to  $V_{BSUP1}$ , the battery supplements the system load. The battery stops supplementing the system load when the voltage on the SYS pin rises within the battery voltage to  $V_{BSUP2}$ . During supplement mode, the battery supplement current is not regulated, however, the BATOCP protection circuit is active. Battery termination is disabled while in supplement mode. Battery voltage has to be higher than battery undervoltage lockout threshold ( $V_{BUVLO}$ ) to be able to supplement the system.

### 8.3.4 Sleep Mode

The device enters the low-power sleep mode if  $V_{IN}$  falls below the sleep-mode entry threshold and  $V_{IN}$  is higher than the undervoltage lockout threshold. In sleep mode, the input is isolated from the battery. This feature prevents draining the battery during the absence of  $V_{IN}$ . Once  $V_{IN} > V_{BAT} + V_{SLEEP}$  and  $V_{IN}$  exceeds the VINDPM threshold, the device initiates a new charge cycle.

### 8.3.5 SYS Regulation

The BQ25185 includes a SYS voltage regulation loop. By regulating the SYS voltage the device prevents downstream devices connected to SYS from being exposed to voltages as high as  $V_{IN\_OVP}$ . SYS regulation is only active when  $V_{IN} > V_{UVLO}$ ,  $V_{IN} > V_{BAT} + V_{SLEEP}$  and  $V_{IN} < V_{IN\_OVP}$ .

For the BQ25185, if the ILIM/VSET is configured for a VBATREG setting higher than 4.3 V, the device regulates the SYS voltage in battery tracking mode. As battery voltage increases,  $V_{SYS}$  is regulated to 225 mV above the battery. If the battery is less than 3.6 V, the  $V_{SYS}$  will be regulated to  $V_{MINSYS}$ . This regulation occurs to ensure proper termination of the battery even if VDDPM is active.

### 8.3.6 ILIM/VSET Control

The input current limit can be controlled the external programmable resistor as indicated below.

The ILIM/VSET pin will be checked in the following conditions:

- Valid adapter present on  $V_{IN}$  ( $V_{IN}$  is considered power good)
- Charge Enable pin state is changed to enable.
  - Toggle the /CE pin when the TS/MR pin is not pressed to avoid charging during pin detection.
- TS/MR push button is not pressed.

If an Open is detected on the ILIM/VSET pin- the device will disable charging but regulate the SYS pin and limit the ILIM current to 500mA.

If a Short is detected on the ILIM/VSET pin, the device will stay in battery only mode.

### 8.3.7 Protection Mechanisms

#### 8.3.7.1 Input Overvoltage Protection

The input overvoltage protection protects the device and downstream components connected to SYS, and BAT against damage from overvoltage on the input supply. When  $V_{IN} > V_{IN\_OVP}$ , a VIN overvoltage condition is determined to exist. During the VIN overvoltage condition, the device turns the battery discharge FET on, the STAT1 and STAT2 pins update to reflect a recoverable fault (STAT1 = LOW, STAT2 = HIGH). Once the VIN overvoltage condition is removed, the STAT1 and STAT2 pins update to normal operation once the startup routine has finished due to a power good VIN detection. Thereafter VIN powergood condition is determined if  $V_{IN} > V_{BAT} + V_{SLEEP}$ .

#### 8.3.7.2 Battery Undervoltage Lockout

To prevent deep discharge of the battery, the device integrates a battery undervoltage lockout feature that disengages the BAT to SYS path when voltage at the battery drops below the BUVLO voltage.

#### 8.3.7.3 Battery Overcurrent Protection

In order to protect the device from overcurrent and prevent excessive battery discharge current, the device detects if the current on the battery FET exceeds IBAT\_OCP. If the BATOCP limit is reached, the battery discharge FET is turned off and the device starts operating in hiccup mode, re-enabling the BATFET  $t_{REC\_SC}$  (250 ms) after being turned OFF by the over current condition. If the overcurrent condition is triggered upon retry for 4 to 7 consecutive times in a 2-s window, the BATFET shall then remain off until valid VIN is connected ( $V_{IN} = V_{IN\_POWERGOOD}$ ). If the overcurrent condition and hiccup operation occurs while in supplement mode where VIN is already present, VIN must be toggled in order for BATFET to be enabled and start another detection cycle.

#### 8.3.7.4 System Overvoltage Protection

The system overvoltage protection is to prevent the SYS from overshooting to a high voltage due to the input supply. The SYS\_OVP will momentarily disconnect the blocking FETs and re-engage when the thresholds have dropped to less than SYS\_OVP\_FALLING threshold.

SYS\_OVP\_RISING threshold is 104 to 106% of target SYS voltage and SYS\_OVP\_FALLING threshold is 101.5 to 103.5% of the target SYS voltage.

### 8.3.7.5 System Short Protection

System short protection kicks in when the following conditions are met - the adapter connected the device turns ON the input FET for 5 ms and it detects the SYS pin to be shorted (voltage on SYS < V<sub>SYS\_SHORT</sub>). In this scenario, the device will turn OFF the input FET for 200 μs and turn it back ON for 5 ms for SYS to rise above the V<sub>SYS\_SHORT</sub> threshold. If after 10 tries, the voltage at SYS does not rise above the V<sub>SYS\_SHORT</sub> threshold, the device will disable both the input and BATFET paths and wait on adapter insertion before turning the paths ON again. A 2s timer is implemented to refresh the retry counter. After 2s, the device will check for system short again repeating the 10 attempts if there is a system short.

### 8.3.7.6 Thermal Protection and Thermal Regulation

During operation, to protect the device from damage due to overheating, the junction temperature of the die, T<sub>J</sub>, is monitored. When T<sub>J</sub> reaches T<sub>SHUT\_RISING</sub> the device stops charging operation and VSYS is shutdown. If In the case where T<sub>J</sub> > T<sub>SHUT\_RISING</sub> prior to power being applied to the device (either battery or adapter), the input FET or BATFET will not turn ON, regardless of TSMR pin. Thereafter if temperature falls below T<sub>SHUT\_FALLING</sub> the device will automatically power up if VIN is present or if in Battery Only mode.

During the charging process, to prevent overheating in the device, the device monitors the junction temperature of the die and reduces the charging current once T<sub>J</sub> reaches the thermal regulation threshold (T<sub>REG</sub>). If the charge current is reduced to 0, the battery supplies the current needed to supply the SYS output.

To ensure that the system power dissipation is under the limit of the device. The power dissipated by the device can be calculated using the following equation:

P<sub>DISS</sub> = P<sub>SYS</sub> + P<sub>BAT</sub> Where:

$$P_{SYS} = (V_{IN} - V_{SYS}) * I_{IN}$$

$$P_{BAT} = (V_{SYS} - V_{BAT}) * I_{BAT}$$

The die junction temperature, T<sub>J</sub>, can be estimated based on the expected board performance using the following equation:

$$T_J = T_A + \theta_{JA} * P_{DISS}$$

The θ<sub>JA</sub> is largely driven by the board layout, board layers, copper thickness and the layout. . For more information about traditional and new thermal metrics, see the [IC Package Thermal Metrics Application Report](#). Under typical conditions, the time spent in this state is very short.

### 8.3.7.7 Safety Timer

At the beginning of each charge cycle mode (Precharge or Fast Charge), the device starts the respective mode safety timer. If charging has not terminated before the programmed safety time, t<sub>MAXCHG</sub> expires or the device does not exit the precharge mode before t<sub>PRECHG</sub> expires, charging is disabled. The precharge safety timer, t<sub>PRECHG</sub>, is 25% of t<sub>MAXCHG</sub>. When a safety timer fault occurs For the device, the STATx pins update to show a non-recoverable fault. The /CE pin or the input power must be toggled in order to clear the safety timer.

### 8.3.8 Pushbutton Wake and Reset Input

The pushbutton function implemented through TS/MR pin has two main functions. First, it serves as a means to wake the device from ultra-low power modes like Factory mode. Second, it serves as a mean to get device into Factory mode after detecting a long button press.

#### 8.3.8.1 Pushbutton Long Button Press Function - Factory mode

The device will perform factory mode entry when the pushbutton is pressed (TS/MR is held low) for a time t<sub>LPRESS</sub> while a valid input is present, then removing VIN once the duration is met. Factory Mode is a low I<sub>Q</sub> state

that turns off the SYS regulation to minimize battery consumption. Toggling the /CE pin will restart the timer for the long press button when VIN is present.

**図 8-3. Enter Factory Mode**

**図 8-4. Exit Factory Mode - VIN Insertion**

To wake up the device from factory mode, insert a valid VIN. The TS/MR push button cannot be used to wake from Factory Mode.

### 8.3.9 External NTC Monitoring (TS)

#### 8.3.9.1 TS Biasing and Function

The device is configured to a simpler HOT/COLD function only. Two temperature thresholds are monitored: the cold battery threshold, and the hot battery threshold. These temperatures correspond to the  $V_{COLD}$  and  $V_{HOT}$  thresholds in the Electrical Characteristics table. Charging and safety timers are suspended when  $V_{TS} < V_{HOT}$  or  $V_{TS} > V_{COLD}$ .

For devices where the TS function is not needed, tie a 10-k $\Omega$  resistor to the TS/MR pin.

There is an active voltage clamp present on this device which will prevent the voltage on TS/MR pin from rising above the  $V_{TS\_CLAMP}$  threshold. This will particularly be ON when the TS/MR pin is floating.

When the button is detected as a “press” during the charging process, charging will be momentarily suspended till the button is high again. When charging is disabled in any of the TS faults, the trickle charging is also disabled.

#### 8.3.10 Status Pins

The device has two open drain configuration status pins (STAT1 and STAT2) which can be externally pulled up and either be connected to an LED or an IO pin of an MCU to be able to inform the host or the user on the charger status.

When there is no battery present, the device will charge the capacitor on the BAT pin and toggle between charging done, charge completed. So STAT1 pin will be stable where as STAT2 pin will toggle between HIGH and LOW.

**表 8-2. Status Pins State Table**

| CHARGING STATE                                                                              | STAT1 PIN STATE | STAT2 PIN STATE |
|---------------------------------------------------------------------------------------------|-----------------|-----------------|
| Charge completed, charger in sleep mode or charge disabled (including $V_{BAT} > V_{RCH}$ ) | HIGH            | HIGH            |

**表 8-2. Status Pins State Table (続き)**

| CHARGING STATE                                                                                | STAT1 PIN STATE | STAT2 PIN STATE |
|-----------------------------------------------------------------------------------------------|-----------------|-----------------|
| Normal Charge in progress (including automatic recharge)                                      | HIGH            | LOW             |
| Recoverable fault (VIN_OVP, TS HOT, TS COLD, TSHUT, System Short protection)                  | LOW             | HIGH            |
| Non-recoverable or latch-off fault (ILIM/ISET pin short, BATOCP, Safety TMR_EXP for charging) | LOW             | LOW             |

## 8.4 Device Functional Modes

The BQ25185 has three main modes of operation: Charger/Adapter Mode (when a supply is connected to IN), Battery Mode (when only battery is connected), and Factory Mode (when battery only but VSYS is turned off). The table below summarizes the functions that are active for each operation mode.

| FUNCTION                      | CHARGER/ADAPTER MODE               | BATTERY MODE | FACTORY MODE |
|-------------------------------|------------------------------------|--------------|--------------|
| Input Overvoltage             | Yes                                | Yes          | No           |
| Input Undervoltage            | Yes                                | Yes          | Yes          |
| Battery Overcurrent           | Yes                                | Yes          | Yes          |
| Input DPM                     | Yes                                | No           | Yes          |
| Dynamic Power Path Management | Yes                                | No           | No           |
| BATFET                        | Yes                                | Yes          | No           |
| TS Measurement                | Yes                                | No           | No           |
| Battery Charging              | Yes                                | No           | No           |
| Input Current Limit           | Yes (Selected by $R_{ILIM/VSET}$ ) | No           | No           |
| Pushbutton Input              | Yes                                | No           | No           |
| Status Pin                    | Yes                                | Yes          | No           |

## 9 Application and Implementation

### 注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 9.1 Application Information

A typical application of the BQ25185 consists of the device configured as a standalone single cell Li-ion battery charger and power path manager or battery applications such as smart-watches and wireless headsets. A battery thermistor may be connected to the TS pin to allow the device to monitor the battery temperature and control charging as desired.

The system designer may connect the TS/MR pin input to a push-button to send interrupts to the host as a button is pressed or to allow the application end user to reset the system.

### 9.2 Typical Application

図 9-1. Typical Application

#### 9.2.1 Design Requirements

The design requirements for the following design example are shown in 表 9-1.

表 9-1. Design Parameters

| PARAMETER                  | VALUE  |
|----------------------------|--------|
| IN Supply Voltage          | 5 V    |
| Battery Regulation Voltage | 4.2 V  |
| Fast Charge Current        | 300 mA |
| Input Current Limit        | 500 mA |

## 9.2.2 Detailed Design Procedure

### 9.2.2.1 Input Current and Battery Regulation Voltage - ILIM/VSET

To configure the device for 4.2 V  $V_{BATREG}$  and an input current limit of 500 mA, the  $R_{ILIM/VSET}$  resistor is set to 18 k $\Omega$ . The resistor value is found in the [ILIM Control](#) section.

### 9.2.2.2 Fast Charge Current- ISET

To configure the device for 300 mA of fast charge current, the  $R_{ISET}$  resistor is set to 1 k $\Omega$ . The resistor value is calculated based on the equations found in [ISET Pin Detection](#).

### 9.2.2.3 Recommended Passive Components

Low ESR ceramic capacitors such as X7R or X5R are preferred for input decoupling capacitors and should be placed as close as possible to the supply and ground pins for the IC. Due to the voltage derating of the capacitors, it is recommended that 25-V rated capacitors are used for the IN and SYS pins which can normally operate at 5 V. After derating the minimum capacitance must be higher than 1  $\mu$ F.

|           |                                                     | MIN | NOM | MAX | UNIT    |
|-----------|-----------------------------------------------------|-----|-----|-----|---------|
| $C_{SYS}$ | Capacitance on SYS pin                              | 1   | 10  | 100 | $\mu$ F |
| $C_{BAT}$ | Capacitance on BAT pin                              | 1   | 1   | -   | $\mu$ F |
| $C_{IN}$  | Capacitance on IN pin ( $t_{VIN\_PRESENT} > 25$ ms) | 1   |     |     | $\mu$ F |

## 9.2.3 Application Curves

$C_{IN} = 1$   $\mu$ F,  $C_{OUT} = 10$   $\mu$ F,  $V_{IN} = 5$  V,  $V_{OUT} = 3.7$  V,  $I_{CHG} = 100$  mA (unless otherwise specified)

**図 9-2. Power Up with IN Supply Insertion with No Battery**

**図 9-3. Power Up with IN Supply Insertion with Battery**

VIN = 5 V → 0 V      VBAT = 3.7 V

図 9-4. Enter Factory Mode

VIN = 0 V → 5 V      VBAT = 3.7 V

図 9-5. Wake up from Factory Mode with Adapter Insertion

VIN = 5 V      VBAT = 3.7 V      ICHG = 100 mA  
Input Source Current Limit = 50 mA

図 9-6. Battery Tracking VINDPM

ISET Short while charging

図 9-7. ISET Short Protection

VIN = 5V → 0V  
VBAT = 3.7 V

図 9-8. VIN Power Down with VBAT Present

### 9.3 Power Supply Recommendations

The BQ25185 requires the adapter or IN supply to be between 3.3 V and 18 V. The battery voltage must be higher than 3.15 V or  $V_{BATUVLO}$  to ensure proper operation.

## 9.4 Layout

### 9.4.1 Layout Guidelines

- To obtain optimal performance, the decoupling capacitor from IN to GND, the capacitor from SYS to GND, and the BAT to GND capacitor should be placed as close as possible to the device.
- A solid ground plane should be used that is tied to the GND pin and thermal pad
- The pushbutton GND should be connected as close to the device as possible
- The high current charge paths into IN, SYS, and BAT must be sized appropriately for the maximum charge current in order to avoid voltage drops in these traces

### 9.4.2 Layout Example

図 9-9. Board Layout Example

## 10 Device and Documentation Support

### 10.1 Device Support

#### 10.1.1 サード・パーティ製品に関する免責事項

サード・パーティ製品またはサービスに関するテキサス・インスツルメンツの出版物は、単独またはテキサス・インスツルメンツの製品、サービスと一緒に提供される場合に関係なく、サード・パーティ製品またはサービスの適合性に関する是認、サード・パーティ製品またはサービスの是認の表明を意味するものではありません。

#### 10.2 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、[www.tij.co.jp](http://www.tij.co.jp) のデバイス製品フォルダを開いてください。  
[通知] をクリックして登録すると、変更されたすべての製品情報に関するダイジェストを毎週受け取ることができます。変更の詳細については、改訂されたドキュメントに含まれている改訂履歴をご覧ください。

#### 10.3 サポート・リソース

テキサス・インスツルメンツ E2E™ サポート・フォーラムは、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
