

# DLPC23x-Q1 車載用デジタル・マイクロミラー・デバイス・コントローラ

## 1 特長

- 車載アプリケーション認定済み
- 以下の結果で AEC-Q100 認定済み:
  - デバイス温度グレード 2: 動作時周囲温度範囲: -40°C ~ 105°C
  - デバイス HBM ESD 分類レベル 2
  - デバイス CDM ESD 分類レベル C4B
- 以下をサポートする DMD ディスプレイコントローラ:
  - DLP553x-Q1 および DLP462x-Q1 車載用車内ディスプレイおよび車外照明チップセット
- ビデオ処理
  - DMD 解像度に合わせて入力画像をスケールング
  - ベゼル調整により、画像の垂直位置を  $\pm 50\%$ 、水平位置を  $\pm 10\%$  まで調整できるため、機械的な位置揃えの必要性を低減 (HUD)
  - 解像度の低いビデオ入力に対応して、ピクセルの 2 倍、4 倍化処理をサポート
  - ガンマ補正
- エラー訂正 (ECC) 付きの組み込み プロセッサ
  - オンチップの診断およびセルフテスト機能
  - 温度監視、デバイス インターフェイス監視、およびフォトダイオード監視を含むシステム診断機能
  - 無段階調光の管理機能を内蔵
  - 構成可能な GPIO
- 外部 RAM 不要、画像処理用の SRAM を内蔵
- 600MHz SubLVDS DMD インターフェイスによる低い消費電力と放射妨害
- 拡散スペクトラムのクロック処理による EMI 低減
- ビデオ入力インターフェイス
  - シングル OpenLDI (FPD-Link I) ポートで最高 110MHz
  - 最高 110MHz の 24 ビット RGB パラレル インターフェイス
- 構成可能なホスト制御インターフェイス
  - シリアル ペリフェラル インターフェイス (SPI) 10MHz
  - I<sup>2</sup>C (400kHz)
  - ホスト IRQ 信号により重要なシステム エラーについてリアルタイムのフィードバックを提供
- TPS99000-Q1 システム管理および照明コントローラとのインターフェイス

## 2 アプリケーション

- 広視野の拡張現実  
ヘッドアップ・ディスプレイ (HUD)
- デジタル・クラスター、ナビゲーション、インフォテインメントのフロント・ガラス・ディスプレイ

- 高解像度ヘッドライト

## 3 概要

車載アプリケーション向け DLPC23x-Q1 デジタル マイクロミラー ディスプレイ (DMD) コントローラは、HUD などの車内アプリケーションや高分解能ヘッドライトなどの車外アプリケーションのチップセットで使用されます。DLP5530-Q1 チップセットには 0.55 インチ DMD、DLP4621-Q1 チップセットには 0.46 インチ DMD が搭載されています。どちらのチップセットにも TPS99000-Q1 システム管理および照明コントローラが含まれています。DLPC23x-Q1 には プロセッサが組み込まれており、このプロセッサにはエラー コード訂正 (SECCDED ECC) が搭載され、ホスト制御およびリアルタイムのフィードバック、オンチップ診断、およびシステム監視機能が使用可能です。オンチップ SRAM が搭載されているため、外部の DRAM が必要ありません。TPS99000-Q1 と組み合わせることで、DLPC23x-Q1 は HUD アプリケーションにおいて 5000:1 を超える高いダイナミック レンジの調光をサポートします。SubLVDS 600MHz DMD インターフェイスによって高い DMD リフレッシュ レートが可能になり、シームレスで鮮鋭なデジタル画像を生成しながら、同時に放射 EMI が低減されます。

DLP テクノロジーをベースとする車載認定プロジェクトの設計と製造を支援するために、多数の光学モジュールメーカーと設計業者が確立されており、それらを活用して、お客様の設計をサポートできます。

### 製品情報

| 部品番号       | パッケージ (1)        | 本体サイズ (公称)        |
|------------|------------------|-------------------|
| DLPC230-Q1 | ZDQ (BGA, 324)   | 23.00mm × 23.00mm |
| DLPC231-Q1 | ZEK (nFBGA, 324) | 15.00mm × 15.00mm |

- (1) 詳細については、「[Mechanical, Packaging, and Orderable Information](#)」セクションを参照してください。

| NAME            | ZDQ324 | ZEK324 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| RESETZ          | F3     | F3     | I <sub>7</sub>     | <p>Active low power-on reset for the DLPC23x-Q1. A low-to-high transition starts self-configuration and initialization of the ASIC.<br/>(‘0’ = Reset, ‘1’ = Normal Operation)<br/>All ASIC power and input clocks must be stable before this reset is deasserted high.<br/>The signals listed below must be forced low by external pulldown, and will then be driven low as the power supplies stabilize with RESETZ asserted.<br/><i>PMIC_LEDSEL_0, PMIC_LEDSEL_1, PMIC_LEDSEL_2, PMIC_LEDSEL_3, DMD_DEN_ARSTZ, PMIC_AD3_CLK, and PMIC_AD3_MOSI</i><br/>All other bidirectional and output signals will be tristated while reset is asserted. External pullups or pulldowns must be added where necessary to protect external devices that can typically be driven by the ASIC to prevent device malfunction.<br/>This pin includes hysteresis.<br/>Specific timing requirements for this signal are shown in <a href="#">セクション 5.12</a>.</p> |
| PMIC_PARKZ      | E3     | E4     | I <sub>7</sub>     | <p>DMD Park Control<br/>(‘0’ = Park, ‘1’ = Un-Park)<br/>The TI TPS99000-Q1 device is used to control this signal. As part of this function, it monitors power to the DLPC23x-Q1 watching for an imminent power loss condition, upon which it will drive the PMIC_PARKZ signal accordingly. The specific timing requirements for this signal are shown in <a href="#">セクション 5.12</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| HOST_IF_SEL     | R4     | N1     | B <sub>13,14</sub> | <p>Selects which input interface port will be used for Host Command and Control. The port that is not selected as the Host Command and Control port will be available as a Diagnostic Processor monitoring port.<br/>(‘0’ = Host SPI, ‘1’ = Host I<sup>2</sup>C)<br/>This pin includes a weak internal pulldown. If a pullup is used to obtain a ‘1’ value, the pullup value must be ≤ 8kΩ.<br/>Tristated while RESETZ is asserted low, and is sampled as a host directive approximately 1.5μs after RESETZ is deasserted. It can be driven as an output for TI debug use after sampling.</p>                                                                                                                                                                                                                                                                                                                                                  |
| HOST_SPI_MODE   | V1     | P2     | B <sub>13,14</sub> | <p>Selects the SPI mode (clock phase and polarity) that will be used with the HOST SPI interface. This value is applicable regardless of whether the Host SPI interface is used for Host Command and Control, or for the Diagnostic Processor monitoring port.<br/>(‘0’ = SPI Mode 0 or 3, ‘1’ = SPI Mode 1 or 2)<br/>This pin includes a weak internal pulldown. If a pullup is used to obtain a ‘1’ value, the pullup value must be ≤ 8kΩ.<br/>Tristated while RESETZ is asserted low, and is sampled as a host directive approximately 1.5μs after RESETZ is deasserted. It can be driven as an output for TI debug use after sampling.</p>                                                                                                                                                                                                                                                                                                 |

(1) Unused inputs must be grounded or pulled down to ground through an external resistor ( $\leq 10\text{k}\Omega$ ).

(2) See 表 4-10 for more information on I/O definitions.

(3) VSYNC and HSYNC polarity are software programmable.

(1) The system only supports the operational use of one port. As two ports are available, the host can select which port they wish to be active (to optimize board routing as an example).

(2) The inputs for any unused ports must be left unconnected, and will be powered down by the system.

(3) See 表 4-10 for more information on I/O definitions.

表 4-4. Pin Functions—DMD Reset and Bias Control Interfaces

| PIN <sup>(1) (2)</sup> |        |        | I/O <sup>(3)</sup> | DESCRIPTION                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------|--------|--------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME                   | ZDQ324 | ZEK324 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                         |
| DMD_DEN_ARSTZ          | D11    | D9     | O <sub>1</sub>     | DMD driver enable signal<br>(‘1’ = Enabled, ‘0’ = Reset)<br>This signal will be driven low after the DMD is parked and before power is removed from the DMD. If the 1.8V power to the DLPC23x-Q1 is independent of the 1.8V power to the DMD, then an external pulldown resistor ( $\leq 2.2\text{k}\Omega$ ) must be used to hold the signal low in the event DLPC23x-Q1 power is inactive while DMD power is applied. |
| DMD_LS0_CLK            | C11    | C9     | O <sub>2</sub>     | TI internal use. Must be left unconnected                                                                                                                                                                                                                                                                                                                                                                               |

| DMD_LS0_RDATA          | C9     | C7     | I <sub>3</sub>     | DMD, low-speed single-ended serial read data                                                                                                                                                                                                                                                                                                                                                                            |

**表 4-4. Pin Functions—DMD Reset and Bias Control Interfaces (続き)**

| PIN <sup>(1) (2)</sup>             |            |            | I/O <sup>(3)</sup> | DESCRIPTION                                                                                  |
|------------------------------------|------------|------------|--------------------|----------------------------------------------------------------------------------------------|
| NAME                               | ZDQ324     | ZEK324     |                    |                                                                                              |
| DMD_LS1_RDATA                      | C8         | C8         | I <sub>3</sub>     | DMD, low-speed single-ended serial read data (Training data response for second port of DMD) |
| DMD_LS0_CLK_P<br>DMD_LS0_CLK_N     | B12<br>A12 | B10<br>A10 | O <sub>4</sub>     | DMD low-speed differential interface clock                                                   |
| DMD_LS0_WDATA_P<br>DMD_LS0_WDATA_N | B11<br>A11 | B9<br>A9   | O <sub>4</sub>     | DMD low-speed differential interface write data                                              |

- (1) The low-speed write control interface to the DMD is differential.  
(2) All control interface reads will make use of the single-ended low-speed signals. The read data will be clocked by the write clock .  
(3) See 表 4-10 for more information on I/O definitions.

**表 4-5. Pin Functions—DMD SubLVDS Interfaces**

- (1) Some GPIO signals are reserved for specific purposes. These signals vary per product configuration. These product allocations are discussed further in [セクション 7.3.7](#). All GPIO that are available for Host use must be configured as an input, a standard output, or an open-drain output. This is set in the flash configuration or by command using the Host command interface. The reset default for all GPIO is as an input signal. An external pullup ( $\leq 10\text{k}\Omega$ ) is required for each signal configured as open-drain.
- (2) See [表 4-10](#) for more information on I/O definitions.
- (3) All GPIO include hysteresis.

表 4-8. Pin Functions—Clock and PLL Support

| PIN          |        |        | I/O <sup>(1)</sup> | DESCRIPTION                                                                                                                                                                                                                                                                         |
|--------------|--------|--------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME         | ZDQ324 | ZEK324 |                    |                                                                                                                                                                                                                                                                                     |
| PLL_REFCLK_I | D15    | D12    | I <sub>17</sub>    | Reference clock crystal input. If an external oscillator is used in place of a crystal, this pin must be left unconnected (floating with no added capacitive load).                                                                                                                 |
| PLL_REFCLK_O | D14    | D13    | B <sub>16,17</sub> | Reference clock crystal return. If an external oscillator is used in place of a crystal, this pin must be used for the oscillator input.                                                                                                                                            |
| OSC_BYPASS   | D16    | C13    | I <sub>19</sub>    | Selects whether an external crystal or external oscillator will be used to drive the internal PLL.<br>(‘0’ = Crystal, ‘1’ = Oscillator)<br>This pin includes a weak internal pulldown. If a pullup is used to obtain a ‘1’ value, the pullup value must be $\leq 8\text{k}\Omega$ . |

- (1) See [表 4-10](#) for more information on I/O definitions.

| 19                 | 3.3V LVCMOS Input                        | VCC3IO_OSC       | ESD diode to GND and supply rail |
| 20                 | 3.3V LVCMOS Output                       | VCC3IO           | ESD diode to GND and supply rail |
| <b>TYPE</b>        |                                          | N/A              |                                  |
| I                  | Input                                    |                  |                                  |
| O                  | Output                                   |                  |                                  |
| B                  | Bidirectional                            |                  |                                  |
| PWR                | Power                                    |                  |                                  |
| RTN                | Ground return                            |                  |                                  |

(1) External inputs (OLDI, Parallel RGB, GPIO, and so on) must not be driven until power supplies are valid.

表 4-11. Internal Pullup and Pulldown Characteristics

| INTERNAL PULLUP AND PULLDOWN<br>RESISTOR CHARACTERISTICS <sup>(1) (2)</sup> | VCCIO | MIN | MAX | UNIT |
|-----------------------------------------------------------------------------|-------|-----|-----|------|
| Weak pullup resistance                                                      | 3.3V  | 40  | 190 | kΩ   |
| Weak pulldown resistance                                                    | 3.3V  | 30  | 190 | kΩ   |

(1) The resistance is dependent on the supply voltage level applied to the I/O.

(2) An external 8kΩ or less pullup or pulldown (if needed) will work for any voltage condition to correctly override any associated internal pullups or pulldowns.

- (1) Stresses beyond those listed under [セクション 5.1](#) may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under [セクション 5.3](#). Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to GND.
- (3) Value calculated using package parameters defined in [セクション 5.4](#).

### 5.2 ESD Ratings

|                    |                            |                                                         | VALUE<br>ZDQ<br>PACKAGE | VALUE<br>ZEK<br>PACKAGE | UNIT |
|--------------------|----------------------------|---------------------------------------------------------|-------------------------|-------------------------|------|
| V <sub>(ESD)</sub> | Electrostatic<br>discharge | Human-body model (HBM), per AEC Q100-002 <sup>(1)</sup> | ±2000                   | ±2000                   | V    |
|                    |                            | Charged-device model (CDM), per<br>AEC Q100-011         | ±500                    | ±500                    |      |
|                    |                            |                                                         | ±750                    | ±750                    |      |

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

## 5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|                             |                                                                                                                 |                                 | MIN   | NOM | MAX   | UNIT |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------|---------------------------------|-------|-----|-------|------|

| V <sub>(VCC3IO_INTF)</sub>  | 3.3V I/O power (Supports: host command (SPI and I <sup>2</sup> C), parallel data interface, HOST_IRQ, and JTAG) | ±8.5% tolerance                 | 3.02  | 3.3 | 3.58  | V    |
| V <sub>(VCC3IO_OSC)</sub>   | 3.3V I/O power (Supports Oscillator)                                                                            | ±8.5% tolerance                 | 3.02  | 3.3 | 3.58  | V    |
| V <sub>(VCC33A_LVDS)</sub>  | 3.3V I/O power (Supports OpenLDI interface)                                                                     | ±8.5% tolerance                 | 3.02  | 3.3 | 3.58  | V    |
| V <sub>(VCC3IO)</sub>       | 3.3V I/O power (Supports all remaining I/O including: GPIO, PMIC_AD3, TSTPT, ETM_TRACE, et cetera)              | ±8.5% tolerance                 | 3.02  | 3.3 | 3.58  | V    |
| T <sub>J</sub>              | Operating junction temperature                                                                                  |                                 | –40   |     | 125   | °C   |
| T <sub>C</sub>              | Operating case temperature                                                                                      |                                 | –40   |     | 124   | °C   |
| T <sub>A</sub>              | Operating ambient temperature <sup>(2)</sup>                                                                    |                                 | –40   |     | 105   | °C   |

(1) These I/O supply ranges are wider to facilitate additional external filtering.

(2) Operating ambient temperature is dependent on system thermal design. Operating case temperature may not exceed its specified range across ambient temperature conditions.

## 5.4 Thermal Information

| THERMAL METRIC <sup>(1)</sup>  |                                                                                                  | ZDQ (BGA) | ZEK (nfbGA) | UNIT |
|--------------------------------|--------------------------------------------------------------------------------------------------|-----------|-------------|------|
|                                |                                                                                                  | 324 PINS  | 324 PINS    |      |
| Ψ <sub>JT</sub> <sup>(2)</sup> | Temperature variance from junction to package top center temperature, per unit power dissipation | 0.77      | 0.2         | °C/W |

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

(2)  $(0.94W) \times (0.2^{\circ}C/W) \approx 0.19^{\circ}C$  temperature difference.

| I <sub>(VCC3IO)</sub>                             | 3.3V I/O current (GPIO, PMIC_AD3, Mstr I <sup>2</sup> C, TSTPT, ETM, and so forth) |                                                     |     | 12.6               | 13.5               | mA   |
| I <sub>(VCC33A_LVDS)</sub>                        | 3.3V I/O current (OpenLDI Interface - each port - 5 lanes active)                  |                                                     |     | 6.3                | 6.8                | mA   |

- (1) Typical-case power measured with PVT condition = nominal process, typical voltage, typical temperature (25°C case temperature). Input source 1152 × 576 24-bit 60Hz OpenLDI with RGBW ramp image.
- (2) Worst-case power PVT condition = corner process, high voltage, high temperature (105°C case temperature). Input source 1358 × 566 24-bit. 60Hz OpenLDI with pseudo-random noise image.
- (3) Estimated current per supply was not directly measured. These values are based on an approximate expected current consumption percentage of the total measured current drawn by each voltage rail.

|           |                                | 3.3V I <sup>2</sup> C buffer (I/O type 12) |     |      | ±10 |      |
|           |                                | 3.3V LVCMOS (I/O type 13)                  |     | ±1.0 | ±10 |      |
|           |                                | 3.3V LVCMOS (I/O type 16)                  |     | ±1.0 |     |      |
|           |                                | 3.3V I <sup>2</sup> C buffer (I/O type 15) |     |      | ±10 |      |
|           |                                | 3.3V LVCMOS (I/O type 20)                  |     | ±1.0 | ±10 |      |

(1) The number inside each parenthesis for the I/O refers to the type defined in 表 4-10.

## 5.7 DMD High-Speed SubLVDS Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

| PARAMETER                 |                                                                |                             | MIN   | NOM  | MAX   | UNIT |
|---------------------------|----------------------------------------------------------------|-----------------------------|-------|------|-------|------|
| $V_{CM}$                  | Steady-state common mode voltage                               | 1.8V SubLVDS (I/O type 4,5) | 0.8   | 0.9  | 1.0   | V    |
| $V_{CM}(\Delta p)^{(1)}$  | $V_{CM}$ change peak-to-peak (during switching)                | 1.8V SubLVDS (I/O type 4,5) |       |      | 75    | mV   |
| $V_{CM}(\Delta ss)^{(1)}$ | $V_{CM}$ change steady state                                   | 1.8V SubLVDS (I/O type 4,5) | –10   |      | 10    | mV   |
| $ V_{OD} ^{(2)}$          | Differential output voltage magnitude. $R_{BGR} = 75k\Omega$ . | 1.8V SubLVDS (I/O type 4,5) | 155   | 200  | 250   | mV   |
| $V_{OD}(\Delta)^{(3)}$    | $V_{OD}$ change (between logic states)                         | 1.8V SubLVDS (I/O type 4,5) | –10   |      | 10    | mV   |
| $V_{OH}$                  | Single-ended output voltage high                               | 1.8V SubLVDS (I/O type 4,5) | 0.88  | 1.00 | 1.125 | V    |
| $V_{OL}$                  | Single-ended output voltage low                                | 1.8V SubLVDS (I/O type 4,5) | 0.675 | 0.80 | 0.925 | V    |
| $t_R^{(2)}$               | Differential output rise time                                  | 1.8V SubLVDS (I/O type 4,5) |       |      | 250   | ps   |
| $t_F^{(2)}$               | Differential output fall time                                  | 1.8V SubLVDS (I/O type 4,5) |       |      | 250   | ps   |
| $f_{MAX}$                 | Max switching rate                                             | 1.8V SubLVDS (I/O type 4,5) |       |      | 1200  | Mbps |
| DCout                     | Output duty cycle                                              | 1.8V SubLVDS (I/O type 4,5) | 45%   | 50%  | 55%   |      |
| $Tx_{term}^{(1)}$         | Internal differential termination                              | 1.8V SubLVDS (I/O type 4,5) | 80    | 100  | 120   | Ω    |

(1) Definition of  $V_{CM}$  changes:

- (2) Note that  $V_{OD}$  is the differential voltage swing measured across a  $100\Omega$  termination resistance connected directly between the transmitter differential pins.  $|V_{OD}|$  is the magnitude of the peak to peak voltage swing across the P and N output pins. Because  $V_{CM}$  cancels out when measured differentially,  $V_{OD}$  voltage swings relative to 0. Rise and fall times are defined for the differential  $V_{OD}$  signal as follows:

Differential Output Signal

(Note:  $V_{CM}$  is removed when signals are viewed differentially)

- (3) When TX data input = '1', differential output voltage  $V_{OD1}$  is defined. When TX data input = '0', differential output voltage  $V_{OD0}$  is defined. As such, the steady state magnitude of the difference is:  $|V_{OD}|(\Delta) = ||V_{OD1}| - |V_{OD0}||$ .

## 5.8 DMD Low-Speed SubLVDS Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

| PARAMETER                 |                                                                |                             | MIN   | NOM  | MAX   | UNIT     |

- (1) The TPS99000-Q1 controls power supply timing for the DLPC23x-Q1. Refer to the [TPS99000-Q1 System Management and Illumination Controller Data Sheet DLPS202](#) for additional system power timing requirements.
- (2) Power supplies do not need to ramp simultaneously, but each supply must reach its minimum voltage within the maximum ramp time specified.
- (3) The DLPC23x-Q1 does not require specific sequencing or alignment of 1.8V and 3.3V supplies. However, the TPS99000-Q1 enforces sequencing of the 1.1V, 1.8V, and 3.3V voltage rails. The following describes DLPC23x-Q1 behavior when the voltage rails are not brought up simultaneously:
- VCCK (1.1V core) Power = On, I/O Power = Off, RESETZ = '0': While this condition exists, additional leakage current can be drawn, and all outputs are unknown (likely to be a weak "low").
  - VCCK (1.1V core) Power = Off, I/O Power = On, RESETZ = '0': While this condition exists all outputs are tristated.
- Neither of these two conditions will impact normal DLPC23x-Q1 reliability.
- (4) RESETZ must be held low if any supply (Core or I/O) is less than its minimum specified on value. For more information on RESETZ, see [セクション 4](#).

### 5.14 OpenLDI Interface General Timing Requirements

The DLPC23x-Q1 ASIC input interface supports a subset of the industry standard OpenLDI (FPD-Link I) interface (Open LVDS Display Interface Specification v0.95 - May 13, 1999). Specifically, from the standard, the ASIC supports the 24-bit, Single Pixel Format, using the Unbalanced Operating Mode and Pixel Mapping.

## 5.14 OpenLDI Interface General Timing Requirements (続き)

The DLPC23x-Q1 ASIC input interface supports a subset of the industry standard OpenLDI (FPD-Link I) interface (Open LVDS Display Interface Specification v0.95 - May 13, 1999). Specifically, from the standard, the ASIC supports the 24-bit, Single Pixel Format, using the Unbalanced Operating Mode and Pixel Mapping.

|              |                                                                   | MIN                         | NOM             | MAX                        | UNIT               |
|--------------|-------------------------------------------------------------------|-----------------------------|-----------------|----------------------------|--------------------|
| $t_{ip2}$    | Input data position 6                                             | $6 * (t_p / 7) - t_{skew}$  | $6 * (t_p / 7)$ | $6 * (t_p / 7) + t_{skew}$ | ps                 |
| $t_{jitter}$ | Input Jitter Tolerance<br>(cycle to cycle, peak to peak)          |                             |                 | 100                        | ps                 |
| $f_{spread}$ | Supported Spread Spectrum range                                   | percent of $f_{clock}$ rate |                 | -1% <sup>(1)</sup>         | +1% <sup>(2)</sup> |
| $f_{mod}$    | Supported Spread Spectrum Modulation Frequency <sup>(3) (4)</sup> | 25                          |                 | 65                         | kHz                |

- (1) This value is limited by the minimum clock frequency for  $f_{clock}$  (that is, if  $f_{clock} = \text{min clock freq}$ , then  $f_{spread} \text{ max} = 0\%$ ).
- (2) This value is limited by the maximum clock frequency for  $f_{clock}$  (that is, if  $f_{clock} = \text{max clock freq}$ , then  $f_{spread} \text{ max} = 0\%$ ).
- (3) Modulation Waveforms supported: Sine and Triangle.
- (4) Spread spectrum on OpenLDI interfaces was simulated, but not tested.
- (5)  $t_{skew}$  for other  $f_{clock}$  values can be estimated by  $\pm t_{skew} = -7.143 * f_{clock} + 1007.1 - (t_{jitter} - 100)$

## 5.16 Host/Diagnostic Port SPI Interface Timing Requirements

The DLPC23x-Q1 ASIC Host/Diagnostic SPI port interface timing requirements are shown below.<sup>(1)</sup>

|                    |                                                                                         |                             | MIN  | MAX   | UNIT |
|--------------------|-----------------------------------------------------------------------------------------|-----------------------------|------|-------|------|
| $f_{\text{clock}}$ | Clock frequency, HOST_SPI_CLK (50% reference points)                                    |                             |      | 10.00 | MHz  |
| $t_{p\_wh}$        | Pulse duration low, HOST_SPI_CLK (50% reference points)                                 |                             | 45.0 |       | ns   |
| $t_{p\_wl}$        | Pulse duration high, HOST_SPI_CLK (50% reference points)                                |                             | 45.0 |       | ns   |
| $t_t$              | Transition time – all input signals                                                     | 20% to 80% reference points |      | 6     | ns   |
| $t_{p\_su}$        | Setup time – HOST_SPI_DIN valid before HOST_SPI_CLK capture edge (50% reference points) |                             | 10.0 |       | ns   |
| $t_{p\_h}$         | Hold time – HOST_SPI_DIN valid after HOST_SPI_CLK capture edge                          | 50% reference points        | 18.0 |       | ns   |
| $t_{\text{out}}$   | Clock-to-Data out - HOST_SPI_DOUT from HOST_SPI_CLK launch edge (50% reference points)  |                             | 0.0  | 35.0  | ns   |

- (1) The DLPC23x-Q1 Host/Diagnostic Port SPI interface supports SPI Modes 0, 1, 2, and 3 (that is, both clock polarities and both clock phases). The HOST\_SPI\_MODE input must be set to match the SPI mode being used.

**图 5-6. Host/Diagnostic Port SPI Interface Timing (Example: SPI Mode 0 (Clock Polarity = 0, Clock Phase = 0))**

## 5.17 Host/Diagnostic Port I<sup>2</sup>C Interface Timing Requirements

The DLPC23x-Q1 ASIC Host/Diagnostic I<sup>2</sup>C port interface timing requirements are shown below.<sup>(1) (2)</sup>

|                    |                                                                   |               | MIN | MAX | UNIT |
|--------------------|-------------------------------------------------------------------|---------------|-----|-----|------|
| $f_{\text{clock}}$ | Clock frequency, HOST_I <sup>2</sup> C_SCL (50% reference points) | Fast-Mode     |     | 400 | kHz  |
|                    |                                                                   | Standard Mode |     | 100 |      |
| $C_L$              | Capacitive Load (for each bus line)                               |               |     | 200 | pF   |

- (1) Meets all I<sup>2</sup>C timing per the I<sup>2</sup>C Bus Specification (except for capacitive loading as specified above). For reference see version 2.1 of the Phillips/NXP specification.
- (2) The maximum clock frequency does not account for rise time, nor added capacitance of PCB or external components which can adversely impact this value.

## 5.18 Flash Interface Timing Requirements

The DLPC23x-Q1 ASIC flash memory interface consists of a SPI serial interface. See [セクション 7.3.4](#).

| (1)                    |                                                                                                                                                          |                             | MIN   | MAX                  | UNIT |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|-------|----------------------|------|
| $f_{\text{clock}}$     | Clock frequency, FLSH_SPI_CLK                                                                                                                            | When VCC3IO_FLSH = 3.3VDC   | 9.998 | 50.01 <sup>(2)</sup> | MHz  |
| $t_{\text{p\_clkper}}$ | Clock period, FLSH_SPI_CLK<br>(50% reference points)                                                                                                     | When VCC3IO_FLSH = 3.3VDC   | 20.0  | 100                  | ns   |
| $t_{\text{p\_wh}}$     | Pulse duration low, FLSH_SPI_CLK<br>(50% reference points)                                                                                               | When VCC3IO_FLSH = 3.3VDC   | 9     |                      | ns   |
| $t_{\text{p\_wl}}$     | Pulse duration high, FLSH_SPI_CLK<br>(50% reference points)                                                                                              | When VCC3IO_FLSH = 3.3VDC   | 9     |                      | ns   |
| $t_{\text{t}}$         | Transition time – all input signals                                                                                                                      | 20% to 80% reference points |       | 6                    | ns   |
| $t_{\text{p\_su}}$     | Setup time – FLSH_SPI_DIO[3:0] valid before<br>FLSH_SPI_CLK falling edge<br>(50% reference points)                                                       | When VCC3IO_FLSH = 3.3VDC   | 7.0   |                      | ns   |
| $t_{\text{p\_h}}$      | Hold time – FLSH_SPI_DIO[3:0] valid after<br>FLSH_SPI_CLK falling edge                                                                                   | 50% reference points        | 0.0   |                      | ns   |
| $t_{\text{p\_clqv}}$   | FLSH_SPI_DIO[3:0] output delay valid time<br>(with respect to falling edge of FLSH_SPI_CLK<br>or falling edge of FLSH_SPI_CSZ)<br>(50% reference points) | When VCC3IO_FLSH = 3.3VDC   | –3.0  | 3.0                  | ns   |

- (1) The DLPC23x-Q1 communicates with flash devices using a slight variant of SPI Transfer Mode 0 (that is, clock polarity = 0, clock phase = 0). Instead of capturing MISO data on the clock edge opposite from that used to transmit MOSI data, the DLPC23x-Q1 captures MISO data on the same clock edge used to transmit the next MOSI data. As such, the DLPC23x-Q1 Flash SPI interface requires that MISO data from the flash device remain active until the end of the full clock cycle to allow the last data bit to be captured. This is shown in [図 5-8](#).
- (2) The actual maximum clock rate driven from the DLPC23x-Q1 can be slightly less than this value.

**図 5-7. Flash Interface Timing**

**図 5-8. Flash Interface Data Capture Requirements**

## 5.19 TPS99000-Q1 SPI Interface Timing Requirements

The DLPC23x-Q1 ASIC to TPS99000-Q1 interface consists of a SPI serial interface.

| (1)                   |                                                                                                                                                      | MIN                         | MAX   | UNIT   |     |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|-------|--------|-----|
| f <sub>clock</sub>    | Clock frequency, PMIC_SPI_CLK                                                                                                                        |                             | 9.998 | 30.006 | MHz |
| t <sub>p_clkper</sub> | Clock period, PMIC_SPI_CLK<br>(50% reference points)                                                                                                 |                             | 33.3  | 100    | ns  |
| t <sub>p_wh</sub>     | Pulse duration high, PMIC_SPI_CLK<br>(50% reference points)                                                                                          |                             | 11.5  |        | ns  |
| t <sub>p_wl</sub>     | Pulse duration low, PMIC_SPI_CLK<br>(50% reference points)                                                                                           |                             | 11.5  |        | ns  |
| t <sub>t</sub>        | Transition time – all input signals                                                                                                                  | 20% to 80% reference points |       | 6      | ns  |
| t <sub>p_su</sub>     | Setup time – PMIC_SPI_DIN valid before PMIC_SPI_CLK falling edge<br>(50% reference points)                                                           |                             | 7.0   |        | ns  |
| t <sub>p_h</sub>      | Hold time – PMIC_SPI_DIN valid after<br>PMIC_SPI_CLK falling edge                                                                                    | 50% reference points        | 0.0   |        | ns  |
| t <sub>p_clqv</sub>   | PMIC_SPI_DOUT output delay (valid) time<br>(with respect to falling edge of PMIC_SPI_CLK or falling edge of PMIC_SPI_CSZ0)<br>(50% reference points) |                             | –3.0  | 3.0    | ns  |

- (1) The DLPC23x-Q1 communicates with the TPS99000-Q1 using a slight variant of SPI Transfer Mode 0 (that is, clock polarity = 0, clock phase = 0). Instead of capturing MISO data on the clock edge opposite from that used to transmit MOSI data, the DLPC23x-Q1 captures MISO data on the same clock edge used to transmit the next MOSI data. As such, the DLPC23x-Q1 SPI interface to the TPS99000-Q1 requires that MISO data from the TPS99000-Q1 remain active until the end of the full clock cycle to allow the last data bit to be captured. This is shown in [Figure 5-12](#).

**Figure 5-9. TPS99000-Q1 Interface Timing**

**図 5-10. TPS99000-Q1 Interface Data Capture Requirements**

## 5.20 TPS99000-Q1 AD3 Interface Timing Requirements

The DLPC23x-Q1 ASIC to TPS99000-Q1 AD3 interface is used to retrieve ADC measurements from the TPS99000-Q1. The interface is similar to SPI and includes a clock, MOSI, and MISO signal.

| (1) (2) (3)            |                                                                                                                     | MIN    | MAX    | UNIT |
|------------------------|---------------------------------------------------------------------------------------------------------------------|--------|--------|------|
| $f_{\text{clock}}$     | Clock frequency, PMIC_AD3_CLK                                                                                       | 29.326 | 30.006 | MHz  |
| $t_{\text{p\_clkper}}$ | Clock period, PMIC_AD3_CLK<br>(50% reference points)                                                                | 33.327 | 34.100 | ns   |
| $t_{\text{p\_wh}}$     | Pulse duration high, PMIC_AD3_CLK<br>(50% reference points) (Referenced to $t_{\text{p\_clkper}}$ )                 | 40%    |        |      |
| $t_{\text{p\_wl}}$     | Pulse duration low, PMIC_AD3_CLK<br>(50% reference points) (Referenced to $t_{\text{p\_clkper}}$ )                  | 40%    |        |      |
| $t_t$                  | Transition time – all input signals<br>20% to 80% reference points                                                  |        | 6      | ns   |
| $t_{\text{p\_su}}$     | Setup time – PMIC_AD3_MISO valid before PMIC_AD3_CLK rising edge<br>(50% reference points)                          | 14.5   |        | ns   |
| $t_{\text{p\_h}}$      | Hold time – PMIC_AD3_MISO valid after PMIC_AD3_CLK rising edge<br>(50% reference points)                            | 0      |        | ns   |
| $t_{\text{p\_clqv}}$   | PMIC_AD3_MOSI output delay (valid) time (with respect to falling edge of<br>PMIC_SPI_CLK)<br>(50% reference points) | –2.0   | 2.0    | ns   |

- (1) PMIC\_AD3\_MOSI ((DLPC23x-Q1) Output / (TPS99000-Q1) Input) is transmitted on the falling edge of PMIC\_AD3\_CLK.  
 (2) PMIC\_AD3\_MISO ((DLPC23x-Q1) Input / (TPS99000-Q1) Output) is captured on the rising edge of PMIC\_AD3\_CLK.  
 (3) PMIC\_AD3\_CLK is used as the primary TPS99000-Q1 system clock in addition to supporting the AD3 interface.

**5-12. TPS99000-Q1 AD3 Data Capture and Transition**

## 5.21 DLPC23x-Q1 I<sup>2</sup>C Port Interface Timing Requirements

The DLPC23x-Q1 Controller (for example, DLPC23x-Q1 to TMP411A) I<sup>2</sup>C port interface timing requirements are shown below.

| (1) (2)            |                                                     | MIN           | MAX | UNIT |
|--------------------|-----------------------------------------------------|---------------|-----|------|
| f <sub>clock</sub> | Clock frequency, MSTR_SCL<br>(50% reference points) | Fast-Mode     | 400 | kHz  |
|                    |                                                     | Standard Mode | 100 |      |
| C <sub>L</sub>     | Capacitive Load (for each bus line)                 |               | 200 | pF   |

- (1) Meets all I<sup>2</sup>C timing per the I<sup>2</sup>C Bus Specification (except for Capacitive Loading as specified above).  
 (2) The maximum clock frequency does not account for rise time, nor added capacitance of PCB or external components, which can adversely impact this value.

## 5.22 Chipset Component Usage Specification

TI DLP® chipsets include a DMD and one or more controllers. Reliable function and operation of TI DMDs requires that they be used in conjunction with all of the other components in the applicable chipset, including those components that contain or implement TI DMD control technology, such as the DLPC23x-Q1. TI DMD control technology is the TI technology and devices for operating or controlling a DLP® products DMD.

## 6 Parameter Measurement Information

### 6.1 HOST\_IRQ Usage Model

In the DLPC23x-Q1, the Host\_IRQ signal is used to serve as an indication that a serious system error has occurred for which the ASIC has executed an emergency shutdown. The specific errors that precipitated the shutdown can be retrieved through the Host Command and Control interface. The actions that are taken by the ASIC for an emergency shutdown are:

- LEDs are disabled.
- The DMD is parked and powered-down.
- The ASIC operational mode is transitioned to Standby.
- The precipitating errors are captured for later review.
- The Host\_IRQ signal is set to a high state.

To recover from an emergency shutdown, the system will require a full power cycle (deassertion of PROJ\_ON). The host must obtain the error history from the ASIC prior to this full reset, as the reset will remove all error history from the system.

図 6-1. Host IRQ Timing

### 6.2 Input Source

The video input source can be configured to accommodate various desired input resolutions. Image processing such as scaling and line replication can be applied to achieve the necessary display resolution. The desired input resolution can depend on product configuration.

For information on how the input image is displayed, refer to the [DLPC230-Q1, DLPC230S-Q1 Programmer's Guide for Display Applications](#), or [DLPC230-Q1 Programmer's Guide for Light Control Applications](#).

#### 6.2.1 Supported Input Sources

The supported sources with typical timings are shown in 表 6-1. These typical timing examples do not minimize blanking or pixel clock rate. Refer to セクション 5.15 for minimum timing specifications.

表 6-1. Typical Timing for Supported Source Resolutions

| HORIZONTAL RESOLUTION | VERTICAL RESOLUTION | HORIZONTAL BLANKING  |                     |                           |                            | VERTICAL BLANKING    |              |                    |                     | VERTICAL RATE (Hz) | PIXEL CLOCK (MHz) |
|-----------------------|---------------------|----------------------|---------------------|---------------------------|----------------------------|----------------------|--------------|--------------------|---------------------|--------------------|-------------------|
|                       |                     | TOTAL <sup>(1)</sup> | SYNC (PIXEL CLOCKS) | BACK PORCH (PIXEL CLOCKS) | FRONT PORCH (PIXEL CLOCKS) | TOTAL <sup>(1)</sup> | SYNC (LINES) | BACK PORCH (LINES) | FRONT PORCH (LINES) |                    |                   |
| 576                   | 288                 | 322                  | 8                   | 154                       | 160                        | 181                  | 8            | 83                 | 90                  | 60                 | 25.270            |

## 7 Detailed Description

### 7.1 Overview

The automotive DLP® Products chipset consists of three components – the DMD (DLP553x-Q1 or DLP462xS-Q1), the DLPC23x-Q1, and the TPS99000-Q1. The DLPC23x-Q1 is the display controller for the DMD - it formats incoming video and controls the timing of the DMD. It also controls TPS99000-Q1 light source signal timing to coordinate with DMD timing to synchronize light output with DMD mirror movement. The DLPC23x-Q1 is designed for automotive applications with a wide operating temperature range and diagnostic features to identify and correct specific system-level failures. The DLPC23x-Q1 provides interfaces such as OpenLDI (video) and SubLVDS (DMD interface) to minimize power consumption and EMI. Applications include head-up display (HUD) and adaptive high beam and smart headlight.

## 7.3 Feature Description

### 7.3.1 Parallel Interface

The parallel interface complies with standard graphics interface protocol, which includes a vertical sync signal (VSYNC), horizontal sync signal (HSYNC), data valid signal (DATEN), a 24-bit data bus (PDATA\_x), and a pixel clock (PCLK). [図 5-5](#) shows the relationship of these signals.

---

#### 注

VSYNC must remain active at all times. If VSYNC is lost, the DMD must be transitioned to a safe state. When the system detects a VSYNC loss, it will switch to a test pattern or splash image as specified in flash by the Host.

---

The parallel interface supports intra-interface bit multiplexing (specified in flash) that can help with board layout as needed. The intra-interface bit multiplexing allows the mapping of any PDATA\_x input to any internal data bus bit. When utilizing this feature, each unique input pin can only be mapped to one unique destination bit. The typical mapping is shown in [図 7-1](#). An example of an alternate mapping is shown in [図 7-2](#).

図 7-1. Example of Typical Parallel Port Bit Mapping

図 7-2. Example of Alternate Parallel Port Bit Mapping

### 7.3.2 OpenLDI Interface

Each DLPC23x-Q1 OpenLDI interface port supports intra-port lane multiplexing (specified in flash) that can help with board layout as needed. The intra-port multiplexing allows the mapping of any Lx\_DATA lane pair to any internal data lane pair. When utilizing this feature, each unique lane pair can only be mapped to one unique

destination lane pair. The typical lane mapping is shown in [Figure 7-3](#). An example of an alternate lane mapping is shown in [Figure 7-4](#).

**Figure 7-3. Example of Typical OpenLDI Port Lane Mapping**

図 7-4. Example of Alternate OpenLDI Port Lane Mapping

### 7.3.3 DMD (SubLVDS) Interface

The DLPC23x-Q1 ASIC DMD interface supports two high-speed SubLVDS output-only interfaces for data transmission, a single low-speed SubLVDS output-only interface for command write transactions, as well as a low-speed single-ended input interface used for command read transactions. The DLPC23x-Q1 supports a limited number of DMD interface swap configurations (specified in Flash) that can help board layout by remapping specific combinations of DMD interface lines to other DMD interface lines as needed. 表 7-1 shows some of the options available.

### 7.3.4 Serial Flash Interface

The DLPC23x-Q1 uses an external SPI serial flash memory device for configuration and operational data. The minimum supported size is 16 Mb. Larger devices can be required based on operation data and splash image size. The maximum supported size is 128 Mb. It must be noted that the system will support 256 Mb and 512 Mb devices, however, only the first 128 Mb of space are used.

The external serial flash device is supported on a single SPI interface and mostly complies with industry standard SPI flash protocol (See [図 5-8](#)). The Host will specify the maximum supported flash interface frequency (which can be based on device limits, system limits, and/or other factors) and the system will program the closest obtainable value less than or equal to this specified maximum.

The DLPC23x-Q1 ASIC flash must be connected to the designated SPI flash interface (FLSH\_SPI\_xxx) to enable support for system initialization, configuration, and operation.

The DLPC23x-Q1 must support any flash device that is compatible with the modes of operation, features, and performance as defined in this section.

**表 7-2. SPI Flash Required Features or Modes of Operation**

| FEATURE                                                                                   | DLPC23x-Q1 REQUIREMENT                                                                                                                                                                                                                  | COMMENTS                   |

| Status register bit(7)                                                                    | Status register write protect (SRWP)                                                                                                                                                                                                    |                            |
| Status register bits(15:8)<br>(expanded status register), or<br>Secondary Status register | The DLPC23x-Q1 supports multi-byte status registers, as well as separate, additional status registers, but only for specific devices/register addresses. The supported registers and addresses are specified in <a href="#">表 7-3</a> . |                            |

**注意**

The selected SPI flash device must block repeated status writes from being written to internal register. The boot application writes to the flash device status register once per 256 bytes during programming. Most flash devices discard status register writes when the status content does not change. Some flash parts, such as the Micron N25Q128A13ESFA0F, do not block status writes when the status data is repeated. This causes the status register to exceed its maximum write limit after several programming cycles, making them incompatible with the DLPC23x-Q1. Note that the main application does not write to the status register.

For each write operation, the DLPC23x-Q1 boot application executes the following:

1. Write enable command
2. Write status command (to unprotect memory)
3. Read status command to poll the successful execution of the write status (repeated as needed)
4. Write enable command
5. Program or erase command
6. Read status command (repeated as needed) to poll the successful execution of the program or erase operation
7. Write disable command (during programming; this is not performed after erase command.)

For each write operation, the DLPC230-Q1 main application executes the following:

1. Write enable command

2. Program or erase command
3. Read status command (repeated as needed) to poll the successful execution of the program or erase operation
4. Write disable command (during programming; this is not performed after erase command)

The specific instruction op-code and timing compatibility requirements are listed in 表 7-3 and *Flash Interface Timing Requirements*. Note that DLPC230-Q1 does not read the flash's full electronic signature ID and thus cannot automatically adapt protocol and clock rates based on the ID.

(1) Only the first data byte is shown, data continues.

More detailed information on the various read operations supported are shown in 表 7-4.

**表 7-4. SPI Flash Supported Read Operation Details**

| READ TYPE <sup>(2)</sup> | NUMBER OF LINES FOR OP-CODE <sup>(1)</sup> | NUMBER OF LINES FOR ADDRESS | NUMBER OF LINES FOR DUMMY BYTES | NUMBER OF LINES FOR RETURN DATA |
|--------------------------|--------------------------------------------|-----------------------------|---------------------------------|---------------------------------|
| Fast Read (1/1)          | 1                                          | 1                           | 1                               | 1                               |
| Dual Read (1/2)          | 1                                          | 1                           | 1                               | 2                               |
| 2X Read (2/2)            | 1                                          | 2                           | 2                               | 2                               |
| Quad Read (1/4)          | 1                                          | 1                           | 1                               | 4                               |
| 4X Read (4/4)            | 1                                          | 4                           | 4                               | 4                               |

- (1) System does not support Read op-codes being spread across more than one data line.
- (2) Flash vendors have diverged in naming and controlling their various read capabilities. As such, the Host needs to be very careful to fully understand what is and what is not supported by the DLPC23x-Q1. In general, for the supported devices, the DLPC23x-Q1 only supports "Extended SPI" or "SPI Mode" (as defined in the various Flash Data Sheets). It does not support "Dual SPI Mode", "Quad SPI

Mode", "QPI", "QPI Mode", "Dual QPI", "Quad QPI", "DTR", or "DDR". If uncertain, most devices will support "Fast Reads" in a manner that is consistent with the DLPC23x-Q1.

**表 7-5. DLPC23x-Q1 Compatible SPI Flash Device Options**

| DENSITY (M-BITS) <sup>(2) (3)</sup> | VENDOR                | PART NUMBER           | PACKAGE SIZE |
|-------------------------------------|-----------------------|-----------------------|--------------|
| <b>3.3V Compatible Devices</b>      |                       |                       |              |
| 128                                 | Micron <sup>(1)</sup> | MT25QL128ABA8ESF-OAAT | SO16         |
| 128                                 | Macronix              | MX25L12835FMR-10G     | SO16         |
| 128                                 | Macronix              | MX25L12845GMR-10G     | SO16         |
| 128                                 | Macronix              | MX25L12839FXDQ-10G    | BGA25        |

- (1) Care must be used when considering Numonyx versions of Micron serial flash devices as they typically do not have the 4KB sector size needed to be DLPC23x-Q1 compatible.
- (2) For any devices not listed on this table, special care must be taken to insure that the requirements shown in 表 7-2 and 表 7-3 are met.
- (3) The boot application writes to the flash device status register once per 256 bytes during programming. Most flash devices discard status register writes when the status content does not change. Some flash parts, such as Micron N25Q128A13ESFA0F, do not block status writes when the status data is repeated. This causes the status register to exceed its maximum write limit after several programming cycles, making them incompatible with the DLPC23x-Q1. Note that the main application does not write to the status register.

While the DLPC23x-Q1 supports a variety of clock rates and read operation types, it does have a minimum flash read bandwidth requirement which is shown in 表 7-6. This minimum read bandwidth can be met in any number of different ways, with the variables being clock rate and read type. The Host is required to select a flash device which can meet this minimum read bandwidth using the DLPC23x-Q1 supported interface capabilities. It must be noted that the Host will specify to the system (through flash parameter) the maximum supported clock rate as well as the supported read types for their selected flash device, with which the DLPC23x-Q1 SW will automatically select an appropriate combination to maximize this bandwidth (which must at least meet the minimum bandwidth requirement assuming a solution exists per the specified parameters).

**表 7-6. SPI Flash Interface Bandwidth Requirements**

| PARAMETER                                            | MIN   | MAX | UNIT |
|------------------------------------------------------|-------|-----|------|
| FLSH_RD <sub>BW</sub> Flash Read Interface Bandwidth | 47.00 |     | Mbps |

### 7.3.5 Serial Flash Programming

The serial flash can be programmed through the DLPC23x-Q1 using Host commands through the SPI or I<sup>2</sup>C command and control interface.

### 7.3.6 Host Command and Diagnostic Processor Interfaces

The DLPC23x-Q1 provides an interface port for Host commands, as well as an interface port for a *diagnostic processor*. There are two external communication ports dedicated for this use: one SPI interface and one I<sup>2</sup>C interface. The host specifies (through the ASIC input pin) which port is used for which purpose (for example, Host Command Interface → SPI, therefore "diagnostic processor" → I<sup>2</sup>C — or they can be reversed).

セクション 5.16 shows the timing requirements for the SPI interface. セクション 5.17 shows the timing requirements for the I<sup>2</sup>C interface. The I<sup>2</sup>C target address pair is 36h/37h.

### 7.3.7 GPIO Supported Functionality

The DLPC23x-Q1 provides 32 general purpose I/O that are available to support a variety of functions for a number of different product configurations. In general, most of these I/O will only support one specific function based on a specific product configuration, although that function can be different for a different product configuration. There are also a few of these I/O that have been reserved for use by the Host for whatever function they can require. In addition, most of these I/O can also be made available for TI test and debug use. Definitions for the HUD and Headlight product configurations are shown in 表 7-7 and 表 7-8.

**表 7-7. GPIO Supported Functionality - HUD Product Configuration**

| GPIO    | SIGNAL NAME             | DESCRIPTION <sup>(1)</sup>                                                                                                                                                                                   |
|---------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GPIO_00 | PMIC_CNTRL_OUT (input)  | LED control feedback from the TPS99000-Q1. An external pulldown resistor must be used (connects to TPS99000-Q1 Drive Enable).                                                                                |
| GPIO_01 | PMIC_SEQ_STRT (output)  | Sequence start output from the DLPC23x-Q1. This must be connected to the TPS99000-Q1 to time LED related actions and shadow TPS99000-Q1 configuration registers. An external pulldown resistor must be used. |
| GPIO_02 | PMIC_COMP_OUT (input)   | LED optical comparison feedback. This is used to count light pulses during each frame. This signal is active-low. An external pulldown resistor must be used.                                                |
| GPIO_03 | PMIC_LED_SEN (output)   | LED Shunt Enable - shunts current from LEDs to allow faster LED turn-off. An external pulldown resistor must be used.                                                                                        |
| GPIO_04 | PMIC_LED_DEN (output)   | LED FET Drive Enable - enables LED current switching and defines LED pulse length. An external pulldown resistor must be used.                                                                               |
| GPIO_05 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_06 | Host Available          | Available for general host use through host commands                                                                                                                                                         |
| GPIO_07 | Host Available          | Available for general host use through host commands                                                                                                                                                         |
| GPIO_08 | Host Available          | Available for general host use through host commands                                                                                                                                                         |
| GPIO_09 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_10 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_11 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_12 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_13 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_14 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_15 | PMIC_WD1 (output)       | Periodic signal that the DLPC23x-Q1 processor generates during normal operation. TPS99000-Q1 monitors this signal and reports if this signal stops pulsing. An external pulldown resistor must be used.      |
| GPIO_16 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_17 | Host Available          | Available for general host use through host commands                                                                                                                                                         |
| GPIO_18 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_19 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_20 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_21 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_22 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_23 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_24 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_25 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_26 | Host Available          | Available for general host use through host commands                                                                                                                                                         |
| GPIO_27 | Host Available          | Available for general host use through host commands                                                                                                                                                         |
| GPIO_28 | Host Available          | Available for general host use through host commands                                                                                                                                                         |
| GPIO_29 | Host Available          | Available for general host use through host commands                                                                                                                                                         |
| GPIO_30 | Host Available          | Available for general host use through host commands                                                                                                                                                         |
| GPIO_31 | Host Available          | Available for general host use through host commands                                                                                                                                                         |

(1) TI recommends that all unused Host Available GPIO be configured as a logic '0' output and be left unconnected in the system. If this is not done, an external pulldown resistor ( $\leq 10\text{ k}\Omega$ ) must be used to avoid floating inputs.

**表 7-8. GPIO Supported Functionality - Headlight Product Configuration**

| GPIO    | SIGNAL NAME             | DESCRIPTION <sup>(1)</sup>                                                                                                                                                                                   |

| GPIO_00 | HL_PWM0 (output)        | PWM 0 Output - This can be used for general purposes such as controlling the level of an external light source.                                                                                              |
| GPIO_01 | PMIC_SEQ_STRT (output)  | Sequence start output from the DLPC23x-Q1. This must be connected to the TPS99000-Q1 to time LED related actions and shadow TPS99000-Q1 configuration registers. An external pulldown resistor must be used. |
| GPIO_02 | HL_PWM1(output)         | PWM 1 Output - This can be used for general purposes such as controlling the level of an external light source.                                                                                              |
| GPIO_03 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_04 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_05 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_06 | Host Available          | Available for general host use through host commands                                                                                                                                                         |
| GPIO_07 | Host Available          | Available for general host use through host commands                                                                                                                                                         |
| GPIO_08 | Host Available          | Available for general host use through host commands                                                                                                                                                         |
| GPIO_09 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_10 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_11 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_12 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_13 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_14 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_15 | PMIC_WD1 (output)       | Periodic signal that the DLPC23x-Q1 processor generates during normal operation. TPS99000-Q1 monitors this signal and reports if this signal stops pulsing. An external pulldown resistor must be used.      |
| GPIO_16 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_17 | HL_PWM2 (output)        | PWM 2 Output - This can be used for general purposes such as controlling the level of an external light source.                                                                                              |
| GPIO_18 | EXT_SMPL                | Connects to TPS99000-Q1 EXT_SMPL input. This sequence-aligned signal can be configured to trigger TPS99000-Q1 ADC sampling.                                                                                  |
| GPIO_19 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_20 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_21 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_22 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_23 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_24 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_25 | Reserved for Future Use | An external pulldown resistor must be used                                                                                                                                                                   |
| GPIO_26 | Host Available          | Available for general host use through host commands                                                                                                                                                         |
| GPIO_27 | Host Available          | Available for general host use through host commands                                                                                                                                                         |
| GPIO_28 | Host Available          | Available for general host use through host commands                                                                                                                                                         |
| GPIO_29 | Host Available          | Available for general host use through host commands                                                                                                                                                         |
| GPIO_30 | Host Available          | Available for general host use through host commands                                                                                                                                                         |
| GPIO_31 | Host Available          | Available for general host use through host commands                                                                                                                                                         |

(1) TI recommends that all unused Host Available GPIO be configured as a logic '0' output and be left unconnected in the system. If this is not done, an external pulldown resistor ( $\leq 10\text{ k}\Omega$ ) must be used to avoid floating inputs.

### 7.3.8 Built-In Self Test (BIST)

The DLPC23x-Q1 provides a significant amount of BIST support to manage the operational integrity of the system. This BIST support is divided into two general BIST types, which are non-periodic and periodic.

Non-periodic BISTs are tests that are typically run one time, and are run outside of normal operation because their activity will disturb the operation of the system. These tests are specified to be run either by a Flash parameter or by a Host command. The Flash parameter specifies which tests are to be run during system power-up and initialization. The Host command is used to select and specify the running of these tests when the system is in Standby Mode (often just before the system is powered down). Some examples of non-periodic tests are: tests for all of the ASIC memories, tests for the main data processing path, and testing of the DMD memory.

Periodic BISTs are tests that are run on an almost continual basis during normal ASIC operation. These tests are managed (set up, enabled, results gathered and evaluated) automatically by the ASIC embedded software. Some examples of periodic tests are: tuning and verification of the DMD High-Speed Interface, input source monitoring (clock, active pixels, active lines), and external video checksum monitoring.

For more information on BISTs, refer to [DLPC230-Q1, DLPC230S-Q1 Programmer's Guide for Display Applications](#), or [DLPC230-Q1 Programmer's Guide for Light Control Applications](#).

### 7.3.9 EEPROMs

The DLPC23x-Q1 can optionally use an external I<sup>2</sup>C EEPROM memory device for storage of calibration data as an alternative to storing calibration data in the SPI flash memory. The EEPROM must be connected to the designated DLPC23x-Q1 controller I<sup>2</sup>C interface (MSTR\_XXX).

The DLPC23x-Q1 supports the EEPROM devices listed in [表 7-9](#).

**表 7-9. DLPC23x-Q1 Supported EEPROMs**

| MANUFACTURER | PART NUMBER | DENSITY (Kb) | PACKAGE SIZE |
|--------------|-------------|--------------|--------------|
| STMicro      | M24C64A125  | 64           | S08          |
| STMicro      | M24C128A125 | 128          | S08          |
| Atmel        | A24C64D     | 64           | S08          |
| Atmel        | A24C128C    | 128          | S08          |

### 7.3.10 Temperature Sensor

The DLPC23x-Q1 requires an external temperature sensor (TMP411) to measure the DMD temperature through a remote temperature sense diode residing within the DMD. The DLPC23x-Q1 also reads the local temperature reported by the TMP411 device. The TMP411 must be connected to the designated DLPC23x-Q1 controller I<sup>2</sup>C interface (MSTR\_XXX).

The DLPC23x-Q1 uses an averaged DMD temperature reading to manage the thermal environment and/or operation of the DMD. This management occurs over the full range of temperatures supported by the DMD. This temperature reading is used change sequence operation across the temperature range, and park the DMD when it is operated outside of its allowable temperature specification.

### 7.3.11 Debug Support

The DLPC23x-Q1 contains a test point output port, TSTPT\_(7:0), which provides the Host with the ability to specify a number of initial system configurations, as well as to provide for ASIC debug support. These test points are tristated while reset is applied, are sampled as inputs approximately 1.5μs after reset is released, and then switch to outputs after the input values have been sampled. The sampled and captured input state for each of these signals is used to configure initial system configurations as specified in the table Pin Functions—Parallel Port Input Data and Control in [セクション 4](#).

There are three other signals (JTAGTDO(3:1)) that are sampled as inputs approximately 1.5μs after reset is released, and then switched to outputs. The sampled and captured state for each of these JTAGTDO signals is used to configure the initial test mode output state of the TSTPT\_(7:0) signals. [表 7-10](#) defines the test mode selection for a few programmable output states for TSTPT\_(7:0) as defined by JTAGTDO(3:1). For normal use (that is, no debug required), the default state of x111 (using weak internal pullups) must be used to allow for the normal use of these JTAG TDO signals.

To allow TI to make use of this debug capability, a jumper to an external pulldown is recommended for JTAGTDO(3:1).

**表 7-10. Test Mode Selection Scenario Defined by JTAGTDO(3:1)**

| TSTPT_(7:0) OUTPUT <sup>(1)</sup> | JTAGTDO(3:1) CAPTURED VALUE               |                            |
|-----------------------------------|-------------------------------------------|----------------------------|
|                                   | x111 (DEFAULT)<br>(NO SWITCHING ACTIVITY) | x010<br>CLOCK DEBUG OUTPUT |
| TSTPT(0)                          | HI-Z                                      | 60MHz                      |
| TSTPT(1)                          | HI-Z                                      | 30MHz                      |
| TSTPT(2)                          | HI-Z                                      | 7.5MHz                     |
| TSTPT(3)                          | HI-Z                                      | LOW                        |
| TSTPT(4)                          | HI-Z                                      | 15MHz                      |
| TSTPT(5)                          | HI-Z                                      | 60MHz                      |
| TSTPT(6)                          | HI-Z                                      | LOW                        |
| TSTPT(7)                          | HI-Z                                      | LOW                        |

(1) These are only the default output selections. Software can reprogram the selection at any time.

## 7.4 Device Functional Modes

The DLPC23x-Q1 has three operational modes—Standby, Display, and Calibration—that are enabled through software commands through the host control interface.

### 7.4.1 Standby Mode

The system will automatically enter Standby mode after power is applied. This is a reduced functional mode that allows Flash update operations and Non-Periodic test operations. The DMD will be parked while the system is operating in this mode and no source can be displayed.

### 7.4.2 Display Mode

This is the main operational mode of the system. In this mode, normal display activities occur. In this mode the system can display video data and execute periodic BISTs. After system initialization, a host command can be used to transition to this mode from Standby mode. Alternatively, a flash configuration setting can be set to allow the system to automatically transition from standby to display mode after system initialization.

### 7.4.3 Calibration Mode

This mode is used to calibrate the system's light sources for the desired display properties. For head-up display applications, this includes the ability to adjust individual color light sources to achieve the desired brightness and color point.

## 8 Application and Implementation

### 注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

### 8.1 Application Information

The DLPC23x-Q1 is designed to support projection-based automotive applications such as head-up display (HUD) and high resolution headlight.

This DLP® Products chipset consists of three components—the Digital Micromirror Device (DMD), the DLPC23x-Q1, and the TPS99000-Q1. The DMD (DLP553x-Q1 or DLP462xS-Q1) is a light modulator consisting of tiny mirrors that are used to form and project images. The DLPC23x-Q1 is a controller for the DMD; it formats incoming video sources and controls the timing of the DMD illumination sources and the DMD to display the incoming video source. The TPS99000-Q1 is a controller for the illumination sources (LEDs or lasers) and a management IC for the entire chipset. In conjunction, the DLPC23x-Q1 and the TPS99000-Q1 can also be used for system-level monitoring, diagnostics, and failure detection features.

### 8.2 Typical Application

#### 8.2.1 Head-Up Display

The figure below shows the system block diagram for a DLP® technology HUD.

図 8-1. HUD System Block Diagram

### 8.2.1.1 Design Requirements

The DLPC23x-Q1 is a controller for the DMD and the timing of the RGB LEDs in the HUD. It requests the proper timing and amplitude from the LEDs to achieve the requested color and brightness from the HUD across the entire operating range. It synchronizes the DMD with these LEDs to display full-color video content sent by the host.

The DLPC23x-Q1 receives command and input video data from a host processor in the vehicle. Read and write (R/W) commands can be sent using either the I<sup>2</sup>C bus or SPI bus. The bus that is not being used for R/W commands can be used as a read-only bus for diagnostic purposes. Input video can be sent over an OpenLDI bus or a parallel 24-bit bus. The SPI flash memory provides the embedded software for the DLPC23x-Q1's embedded processor, color calibration data, and default settings. The TPS99000-Q1 provides diagnostic and monitoring information to the DLPC23x-Q1 using a SPI bus and several other control signals such as PARKZ, INTZ, and RESETZ to manage power-up and power-down sequencing. The DLPC23x-Q1 interfaces to a TMP411 through I<sup>2</sup>C for temperature information.

The outputs of the DLPC23x-Q1 are LED drive information to the TPS99000-Q1, control signals to the DMD, and monitoring and diagnostics information to the host processor. Based on a host requested brightness and the operating temperature, the DLPC23x-Q1 determines the proper timing and amplitudes for the LEDs. It passes this information to the TPS99000-Q1 using a SPI bus and several additional control signals such as D\_EN, S\_EN, and SEQ\_STRT. It controls the DMD mirrors by sending data over a SubLVDS bus. It can alert the host about any critical errors using a HOST\_IRQ signal.

The TPS99000-Q1 is a highly-integrated mixed-signal IC that controls DMD power, the analog response of the LEDs, and provides monitoring and diagnostics information for the HUD system. The power sequencing and monitoring blocks of the TPS99000-Q1 properly power up the DMD, provide accurate DMD voltage rails, as well as monitor the system's power rails during operation. The integration of these functions into one IC significantly reduces design time and complexity. The highly accurate photodiode (PD) measurement system and the dimming controller block precisely control the LED response. This enables a DLP technology HUD to achieve a very high dimming range (> 5000:1) with accurate brightness and color across the temperature range of the system. Finally, the TPS99000-Q1 has several general-purpose ADCs that developers can use for system-level monitoring, such as over-brightness detection.

The TPS99000-Q1 receives inputs from the DLPC23x-Q1, power rail voltages for monitoring, a photodiode that is used to measure LED response, the host processor, and potentially several other ADC ports. The DLPC23x-Q1 sends commands to the TPS99000-Q1 over a SPI port and several other control signals. The TPS99000-Q1 includes watchdogs to monitor the DLPC23x-Q1 and verify it is operating as expected. The power rails are monitored by the TPS99000-Q1 to detect power failures or glitches and request a proper power down of the DMD in case of an error. The photodiode's current is measured and amplified using a transimpedance amplifier (TIA) within the TPS99000-Q1. The host processor can read diagnostics information from the TPS99000-Q1 using a dedicated SPI bus, adding an independent monitoring path from the host processor. Additionally the host can request the system to be turned on or off using a PROJ\_ON signal. The TPS99000-Q1 has several general-purpose ADCs that can be used to implement other system features such as over-brightness and over-temperature detection.

The outputs of the TPS99000-Q1 are LED drive signals, diagnostic information, and error alerts to the DLPC23x-Q1. The TPS99000-Q1 has signals connected to the LM3409 buck controller for high power LEDs and to discrete hardware that control the LEDs. The TPS99000-Q1 can output diagnostic information to the host and the DLPC23x-Q1 over two SPI buses. It also has signals such as RESETZ, PARKZ, and INTZ that can be used to trigger power down or reset sequences.

The DMD is a micro-electro-mechanical system (MEMS) device that receives electrical signals as an input (video data) and produces a mechanical output (mirror position). The electrical interface to the DMD is a SubLVDS interface driven with the DLPC23x-Q1. The mechanical output is the state of more than 1.3 million mirrors in the DMD array that can be tilted  $\pm 12^\circ$ . In a projection system, the mirrors are used as pixels to display an image.

## 8.2.2 Headlight

Figure 8-2 shows the system block diagram for a DLP® headlight.

Figure 8-2. Headlight System Block Diagram

### 8.2.2.1 Design Requirements

The DLPC230-Q1 is a controller for the DMD and the light sources in the DLP technology headlight. It receives input video from the host and synchronizes DMD and light source timing to achieve the desired video output. The DLPC230-Q1 formats input video data that is displayed on the DMD. It synchronizes these video segments with light source timing to create video with grayscale shading.

The DLPC230-Q1 receives command and input video data from a host processor in the vehicle. R/W commands can be sent using either the I²C bus or SPI bus. The bus that is not being used for R/W commands can be used as a read-only bus for diagnostic purposes. Input video can be sent over an OpenLDI bus or a parallel 24-bit bus. The 24-bit bus can be limited to only 8-bits of data for single light source systems such as headlights. The SPI flash memory provides the embedded software for the DLPC230-Q1's embedded processor and default settings. The TPS99000-Q1 provides diagnostic and monitoring information to the DLPC230-Q1 using a SPI bus and several other control signals such as PARKZ, INTZ, and RESETZ to manage power-up and power-down sequencing. The TMP411 uses an I²C interface to provide the DMD array temperature to the DLPC230-Q1.

The outputs of the DLPC230-Q1 are configuration and monitoring commands to the TPS99000-Q1, timing controls to the LED or laser driver, control signals to the DMD, and monitoring and diagnostics information to the

host processor. The DLPC230-Q1 communicates with the TPS99000-Q1 over a SPI bus. It uses this to configure the TPS99000-Q1 and to read monitoring and diagnostics information from the TPS99000-Q1. The DLPC230-Q1 sends drive enable signals to the LED or laser driver, and synchronizes this with the DMD mirror timing. The control signals to the DMD are sent using a SubLVDS interface.

The TPS99000-Q1 is a highly integrated mixed-signal IC that controls DMD power, the timing of the LEDs or lasers, and provides monitoring and diagnostics information for the DLP technology headlight system. The power sequencing and monitoring blocks of the TPS99000-Q1 properly power up the DMD and provide accurate DMD voltage rails, and then monitor the system's power rails during operation. The integration of these functions into one IC significantly reduces design time and complexity. The TPS99000-Q1 also has several output signals that can be used to control a variety of LED or laser driver topologies. The TPS99000-Q1 also has several general-purpose ADCs that designers can use for system level monitoring.

The TPS99000-Q1 receives inputs from the DLPC230-Q1, the power rails it monitors, the host processor, and potentially several other ADC ports. The DLPC230-Q1 sends configuration and control commands to the TPS99000-Q1 over a SPI bus and several other control signals. The TPS99000-Q1 includes watchdogs to monitor the DLPC230-Q1 and verify it is operating as expected. The power rails are monitored by the TPS99000-Q1 to detect power failures or glitches and request a proper power down of the DMD in case of an error. The host processor can read diagnostics information from the TPS99000-Q1 using a dedicated SPI bus. Additionally the host can request the image to be turned on or off using a PROJ\_ON signal. Lastly, the TPS99000-Q1 has several general-purpose ADCs that can be used to implement system level monitoring functions.

The outputs of the TPS99000-Q1 are diagnostic information and error alerts to the DLPC230-Q1, and control signals to the LED or laser driver. The TPS99000-Q1 can output diagnostic information to the host and the DLPC230-Q1 over two SPI buses. In case of critical system errors, such as power loss, it outputs signals to the DLPC230-Q1 that trigger power down or reset sequences. It also has output signals that can be used to implement various LED or laser driver topologies.

The DMD is a micro-electro-mechanical system (MEMS) device that receives electrical signals as an input (video data), and produces a mechanical output (mirror position). The electrical interface to the DMD is a SubLVDS interface with the DLPC230-Q1. The mechanical output is the state of more than 1.3 million mirrors in the DMD array that can be tilted  $\pm 12^\circ$ . In a projection system the mirrors are used as pixels to display an image.

### 8.2.2.2 Headlight Video Input

The DLPC230-Q1 accepts 8-bit grayscale video data when used in headlight applications.

When using the parallel video port, PDATA\_[16-23] are utilized (red input when using a typical RGB888 mapping). PDATA\_[0-15] must be tied to ground.

When using the OpenLDI video ports, data bits R0 - R7 are utilized. B0-B7 and G0-G7 are unused.

## 8.3 Power Supply Recommendations

### 8.3.1 Power Supply Management

The TPS99000-Q1 manages power for the DLPC23x-Q1 and DMD. See [セクション 5.12](#) for all power sequencing and timing requirements.

### 8.3.2 Hot Plug Usage

The DLPC23x-Q1 does not support Hot Plug use (for itself or for any DMD connected to the system). As such, the system must always be powered down prior to removal of the ASIC or DMD from any system.

### 8.3.3 Power Supply Filtering

The following filtering circuits are recommended for the various supply inputs. High frequency 0.1- $\mu$ F capacitors must be evenly distributed amongst the power balls and placed as close to the power balls as possible.

図 8-3. VCCCK Recommended Filter

図 8-4. VCC11A\_LVDS Recommended Filter

図 8-5. VCC11A\_DDI Recommended Filter

図 8-6. VCC18A\_LVDS Recommended Filter

図 8-7. VCC33IO Recommended Filter

図 8-8. VCC33IO\_FLSH Recommended Filter

図 8-9. VCC33IO\_INTF Recommended Filter

図 8-10. VCC33A\_LVDS Recommended Filter

## 8.4 Layout

### 8.4.1 Layout Guidelines

#### 8.4.1.1 PCB Layout Guidelines for Internal ASIC PLL Power

The following guidelines are recommended to achieve desired ASIC performance relative to the internal PLL. The DLPC23x-Q1 contains two internal PLLs that have dedicated analog supplies (VCC11AD\_PLLM, GND11AD\_PLLM, VCC11AD\_PLLD, GND11AD\_PLLD). At a minimum, VCC11AD\_PLLx power and GND11AD\_PLLx ground pins must be isolated using a simple passive filter consisting of two series ferrites and two shunt capacitors (to widen the spectrum of noise absorption). Recommended values and layout are shown in 表 8-1 and 図 8-11 respectively.

**表 8-1. Recommended PLL Filter Components**

| COMPONENT       | PARAMETER            | RECOMMENDED VALUE | UNIT |
|-----------------|----------------------|-------------------|------|
| Shunt Capacitor | Capacitance          | 0.1               | μF   |
| Shunt Capacitor | Capacitance          | 1.0               | μF   |
| Series Ferrite  | Impedance at 100 MHz | > 100             | Ω    |
|                 | DC Resistance        | < 0.40            |      |

Because the PCB layout is critical to PLL performance, it is vital that the quiet ground and power are treated like analog signals. Additional design guidelines are as follows:

- All four components must be placed as close to the ASIC as possible.
- It is especially important to keep the leads of the high frequency capacitors as short as possible.
- A capacitor of each value must be connected across VCC11AD\_PLLM / GND11AD\_PLLM and VCC11AD\_PLLD / GND11AD\_PLLD respectively on the ASIC side of the ferrites.
- VCC11AD\_PLLM and VCC11AD\_PLLD must be a single trace from the DLPC23x-Q1 to both capacitors and then through the series ferrites to the power source.
- The power and ground traces must be as short as possible, parallel to each other, and as close as possible to each other.

**8-11. DLPC230-Q1 PLL Filter Layout**

図 8-12. DLPC231-Q1 PLL Filter & Crystal Layout

### 8.4.1.2 DLPC23x-Q1 Reference Clock

The DLPC23x-Q1 requires an external reference clock to feed its internal PLL. A crystal or oscillator can supply this reference. The recommended crystal configurations and reference clock frequencies are listed in 表 8-2, with additional required discrete components shown in 図 8-13 and defined in 表 8-2.

A.  $C_L$  = Crystal load capacitance

B.  $R_{FB}$  = Feedback Resistor

図 8-13. Discrete Components Required When Using Crystal

#### 8.4.1.2.1 Recommended Crystal Oscillator Configuration

表 8-2. Recommended Crystal Configuration

| PARAMETER                                                                                 | RECOMMENDED                                               | UNIT |
|-------------------------------------------------------------------------------------------|-----------------------------------------------------------|------|
| Crystal circuit configuration                                                             | Parallel resonant                                         |      |
| Crystal type                                                                              | Fundamental (first harmonic)                              |      |
| Crystal nominal frequency                                                                 | 16                                                        | MHz  |
| Crystal frequency tolerance (including accuracy, temperature, aging and trim sensitivity) | ±200                                                      | PPM  |
| Maximum crystal equivalent series resistance (ESR)                                        | 50                                                        | Ω    |
| Crystal load capacitance                                                                  | 10                                                        | pF   |
| Temperature range                                                                         | –40°C to +105°C                                           | °C   |
| Drive level (nominal)                                                                     | 100                                                       | μW   |
| $R_{FB}$ feedback resistor (nominal)                                                      | 1                                                         | MΩ   |
| $C_{L1}$ external crystal load capacitor                                                  | See equation in (1)                                       | pF   |
| $C_{L2}$ external crystal load capacitor                                                  | See equation in (2)                                       | pF   |
| PCB layout                                                                                | A ground isolation ring around the crystal is recommended |      |

(1)  $CL1 = 2 \times (CL - C_{stray\_pll\_refclk\_i})$ , where:  $C_{stray\_pll\_refclk\_i}$  = Sum of package and PCB stray capacitance at the crystal pin associated with the ASIC pin  $pll\_refclk\_i$ .

(2)  $CL2 = 2 \times (CL - C_{stray\_pll\_refclk\_o})$ , where:  $C_{stray\_pll\_refclk\_o}$  = Sum of package and PCB stray capacitance at the crystal pin associated with the ASIC pin  $pll\_refclk\_o$ .

The crystal circuit in the DLPC23x-Q1 ASIC has dedicated power (VCC3IO\_COSC) and ground (GNDIOLA\_COSC) pins, with the recommended filtering shown in 図 8-14.

**図 8-14. Crystal Power Supply Filtering**

**表 8-3. DLPC23x-Q1 Recommended Crystal Parts**

| MANUFACTURER | PART NUMBER               | SPEED  | FREQUENCY TOLERANCE, FREQUENCY STABILITY, AGING/YEAR | ESR      | LOAD CAPACITANCE | OPERATING TEMPERATURE |
|--------------|---------------------------|--------|------------------------------------------------------|----------|------------------|-----------------------|
| TXC          | AM16070006 <sup>(1)</sup> | 16 MHz | Freq Tolerance: ±10 ppm                              | 50-Ω max | 10 pF            | –40°C to +125°C       |
|              |                           |        | Freq Stability: ±50 ppm                              |          |                  |                       |
|              |                           |        | Aging/Year: ±3 ppm                                   |          |                  |                       |

(1) This device requires a 3-kΩ series resistor to limit power.

If an external oscillator is used, the oscillator output must drive the PLL\_REFCLK\_O pin on the DLPC23x-Q1 ASIC, the PLL\_REFCLK\_I pin must be left unconnected, and the OSC\_BYPASS pin must = logic HIGH.

#### 8.4.1.3 DMD Interface Layout Considerations

The DLPC23x-Q1 ASIC subLVDS HS/LS differential interface waveform quality and timing is dependent on the total length of the interconnect system, the spacing between traces, the characteristic impedance, etch losses, and how well matched the lengths are across the interface. Thus, ensuring positive timing margin requires attention to many factors.

DLPC23x-Q1 I/O timing parameters as well as DMD I/O timing parameters can be found in their corresponding data sheets. Similarly, PCB routing mismatch can be budgeted and met through controlled PCB routing. PCB design recommendations are provided in 表 8-4 and 図 8-15 as a starting point for the customer.

**表 8-4. PCB Recommendations for DMD Interface**

| PARAMETER <sup>(1)</sup> <sup>(2)</sup> |                              | MIN                                    | MAX | UNIT |
|-----------------------------------------|------------------------------|----------------------------------------|-----|------|
| T <sub>W</sub>                          | Trace Width                  | 4                                      |     | mils |
| T <sub>S</sub>                          | Intra-lane Trace Spacing     | 4                                      |     | mils |
| T <sub>SPP</sub>                        | Inter-lane Trace Spacing     | 2 * (T <sub>S</sub> + T <sub>W</sub> ) |     | mils |
| R <sub>BGR</sub>                        | Resistor - Bandgap Reference | 42.2 (1%)                              |     | kΩ   |

- (1) Recommendations to achieve the desired nominal differential impedance as specified by Tx<sub>load</sub> in セクション 5.7 and セクション 5.8.  
 (2) If using the minimum trace width and spacing to escape the ASIC ball field, widening these out after escape can be desirable if practical to achieve the target 100-Ω impedance (e.g. to reduce transmission line losses).

**図 8-15. DMD Differential Layout Recommendations**

#### 8.4.1.4 General PCB Recommendations

TI recommends the following to achieve good thermal connectivity:

- A minimum of four power and ground planes
  - ZDQ package = 1oz copper power planes and 2oz copper ground planes
  - ZEK package = 1oz copper power planes and 1oz copper ground planes
- A copper plane beneath the thermal ball array containing a via farm with the following attributes
  - Copper plane area (top side of PCB, under package)
    - ZDQ package = 8.0mm × 8.0mm
    - ZEK package = 4.8mm × 4.8mm
  - Copper plane area (bottom side of PCB, opposite of package)
    - ZDQ package = 6.0mm × 6.0mm
    - ZEK package = 4.8mm × 4.8mm
  - Thermal via quantity
    - ZDQ package = 7 × 7 array of vias
    - ZEK package = 5 × 5 array of vias
  - Thermal via size
    - ZDQ package = 0.25mm (10 mils)
    - ZEK package = 0.203mm (8 mils)
  - Thermal via plating thickness
    - ZDQ package = 0.05mm (2 mils) wall thickness
    - ZEK package = 0.025mm (1 mils) wall thickness
- PCB copper coverage per layer
  - Power and ground layers: 90% minimum coverage
  - Top/bottom signal layers (ground fill to achieve coverage): 70% minimum coverage with 1.5oz copper

#### 8.4.1.5 General Handling Guidelines for Unused CMOS-Type Pins

To avoid potentially damaging current caused by floating CMOS input-only pins, TI recommends that unused ASIC input pins be tied through a pullup resistor to its associated power supply or a pulldown to ground unless specifically noted otherwise in [セクション 4](#). For ASIC inputs with internal pullup or pulldown resistors, it is unnecessary to add an external pullup or pulldown unless specifically recommended. Note that internal pullup and pulldown resistors are weak and must not be expected to drive the external line. When external pullup or pulldown resistors are needed for pins that have built-in weak pullups or pulldowns, use the value specified in [表 4-11](#).

Unused output-only pins must never be tied directly to power or ground, but can be left open.

When possible, TI recommends that unused bidirectional I/O pins be configured to their output state such that the pin can be left open. If this control is not available and the pins can become an input, then they must be pulled up (or pulled down) using an appropriate, dedicated resistor.

#### 8.4.1.6 Maximum Pin-to-Pin, PCB Interconnects Etch Lengths

**表 8-5. Max Pin-to-Pin PCB Interconnect Recommendations—DMD**

| ASIC INTERFACE                 | SIGNAL INTERCONNECT TOPOLOGY <sup>(1) (2)</sup> |                                   | UNIT       |

- (1) Max signal routing length includes escape routing.  
(2) Multi-board DMD routing length is more restricted due to the impact of the connector.  
(3) Due to board variations, these are impossible to define. Any board designs must SPICE simulate with the ASIC IBIS models to verify signal routing lengths do not exceed requirements.

|                                                            | PMIC_SEQ_STRT   |                  |                             |                                                          |            |
|                                                            | PMIC_ADC3_MOSI  |                  |                             |                                                          |            |
| OpenLDI                                                    | Lx_DATAx_N      | Lx_DATAx_P       | N/A                         | $0.0315 \pm 0.025$<br>( $0.8 \pm 0.635$ ) <sup>(6)</sup> | in<br>(mm) |
| OpenLDI                                                    | Lx_CLK_N        | Lx_CLK_P         | N/A                         | $0.0315 \pm 0.025$<br>( $0.8 \pm 0.635$ ) <sup>(6)</sup> | in<br>(mm) |

(1) These routing requirements are specific to the PCB routing. Internal package routing mismatches in the DLPC23x-Q1 and DMD have already been accounted for in these requirements.

(2) Training is applied to DMD HS data lines, so defined matching requirements are slightly relaxed.

(3) This is an inter-pair specification (that is, differential pair to differential pair within the group).

(4) This is an intra-pair specification (that is, length mismatch between P and N for the same pair).

(5) ZEK324 package trace length of the DMD interface differential N signals are 0.8mm longer than the P signals to simplify matching of the PCB signals.

(6) ZEK324 package trace length of the OpenLDI interface differential P signals are 0.8mm longer than the N signals to simplify matching of the PCB signals.

#### 8.4.1.7 Number of Layer Changes

- Single-ended signals: Minimize the number of layer changes.
- Differential signals: Individual differential pairs can be routed on different layers, but the signals of a given pair must not change layers.

#### 8.4.1.8 Stubs

- Stubs must be avoided.

#### 8.4.1.9 Terminations

- No external termination resistors are required on the DMD\_HS or DMD\_LS differential signals.
- The DMD\_LS0\_RDATA and DMD\_LS1\_RDATA single-ended signal paths must include a 10-Ω series termination resistor located as close as possible to the corresponding DMD pin.
- DMD\_DEN\_ARSTZ does not typically require a series resistor, however, for a long trace, one can be needed to reduce undershoot/overshoot.

#### 8.4.1.10 Routing Vias

- The number of vias on each DMD\_HS and DMD\_LS signal must be minimized and must not exceed two. If two are required, one must be placed at each end of the line (one at the ASIC and one at the DMD).

#### 8.4.1.11 Layout Examples

Below is an example layout for the DLPC231-Q1. Complete EVM reference designs are available on TI.com.

✎ 8-16. DLPC231-Q1 Top level Layout Example - OLDI and DMD LVDS

#### 8.4.2 Thermal Considerations

The underlying thermal limitation for the DLPC23x-Q1 is that the maximum operating junction temperature ( $T_J$ ) not be exceeded (this is defined in [セクション 5.3](#)). This temperature is dependent on operating ambient temperature, airflow, PCB design (including the component layout density and the amount of copper used), power dissipation of the DLPC23x-Q1, and power dissipation of surrounding components. The DLPC23x-Q1's package is designed primarily to extract heat through the power and ground planes of the PCB. Thus, copper content and airflow over the PCB are important factors.

TI highly recommends that after the host PCB is designed and built that the thermal performance be measured and validated.

To do this, measure the top center case temperature under the worse case product scenario (max power dissipation, max voltage, max ambient temperature) and validate that the maximum recommended case temperature ( $T_C$ ) is not exceeded. This specification is based on the measured  $\phi_{JT}$  for the DLPC23x-Q1 package and provides a relatively accurate correlation to junction temperature. Take care when measuring this case temperature to prevent accidental cooling of the package surface. TI recommends a small (approximately 40 gauge) thermocouple. The bead and thermocouple wire must contact the top of the package and be covered with a minimal amount of thermally conductive epoxy. The wires must be routed closely along the package and the board surface to avoid cooling the bead through the wires.

### 9.1.2.3 Video Timing Parameter Definitions

|                                              |                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Active Lines Per Frame (ALPF)</b>         | Defines the number of lines in a frame containing displayable data: ALPF is a subset of the TLPF.                                                                                                                                                                                                                    |
| <b>Active Pixels Per Line (APPL)</b>         | Defines the number of pixel clocks in a line containing displayable data: APPL is a subset of the TPPL.                                                                                                                                                                                                              |
| <b>Horizontal Back Porch (HBP) Blanking</b>  | Number of blank pixel clocks after horizontal sync but before the first active pixel. Note: HBP times are reference to the leading (active) edge of the respective sync signal.                                                                                                                                      |
| <b>Horizontal Front Porch (HFP) Blanking</b> | Number of blank pixel clocks after the last active pixel but before Horizontal Sync.                                                                                                                                                                                                                                 |
| <b>Horizontal Sync (HS)</b>                  | Timing reference point that defines the start of each horizontal interval (line). The absolute reference point is defined by the active edge of the HS signal. The active edge (either rising or falling edge as defined by the source) is the reference from which all horizontal blanking parameters are measured. |
| <b>Total Lines Per Frame (TLPF)</b>          | Defines the vertical period (or frame time) in lines: TLPF = Total number of lines per frame (active and inactive).                                                                                                                                                                                                  |
| <b>Total Pixel Per Line (TPPL)</b>           | Defines the horizontal line period in pixel clocks: TPPL = Total number of pixel clocks per line (active and inactive).                                                                                                                                                                                              |
| <b>Vertical Sync (VS)</b>                    | Timing reference point that defines the start of the vertical interval (frame). The absolute reference point is defined by the active edge of the VS signal. The active edge (either rising or falling edge as defined by the source) is the reference from which all vertical blanking parameters are measured.     |
| <b>Vertical Back Porch (VBP) Blanking</b>    | Number of blank lines after vertical sync but before the first active line.                                                                                                                                                                                                                                          |
| <b>Vertical Front Porch (VFP) Blanking</b>   | Number of blank lines after the last active line but before vertical sync.                                                                                                                                                                                                                                           |

## 9.3 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

|--------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| • Updated section for inclusive terminology; Added note to <a href="#">表 4-10</a> .....                                                                | <a href="#">3</a>  |
| • Changed <i>ESD Ratings</i> table to the automotive format; added <i>ESD Ratingsspec</i> for ZEK package.....                                         | <a href="#">15</a> |
| • Removed "Advanced Information" comment; Updated footnote 2 example.....                                                                              | <a href="#">16</a> |
| • Updated Max current values for VCC1.1 and VCC1.8 total and each supply input.....                                                                    | <a href="#">17</a> |
| • Updated Package - Maximum Power.....                                                                                                                 | <a href="#">21</a> |
| • Updated <a href="#">セクション 5.20</a> for inclusive terminology.....                                                                                    | <a href="#">32</a> |
| • Updated <a href="#">セクション 5.21</a> section for inclusive terminology.....                                                                            | <a href="#">34</a> |
| • Updated <a href="#">セクション 7.3.9</a> for inclusive terminology.....                                                                                   | <a href="#">50</a> |
| • Updated <a href="#">セクション 7.3.10</a> for inclusive terminology.....                                                                                  | <a href="#">50</a> |
| • Added Layout examples.....                                                                                                                           | <a href="#">67</a> |
| • Added DLPC231 Device Markings.....                                                                                                                   | <a href="#">68</a> |
| • Updated ZDQ0324A package outline to show alternate mold dimension; Added ZEK0324A package outline drawing to support DLPC231-Q1 and DLPC231S-Q1..... | <a href="#">72</a> |

| <b>Changes from Revision F (June 2018) to Revision G (September 2023)</b>                                            | <b>Page</b>       |
|----------------------------------------------------------------------------------------------------------------------|-------------------|
| • Changed the DMD Pins assignment: DMD_HS1_WDATA4_P—DMD_HS1_WDATA7_N; Updated section for inclusive terminology..... | <a href="#">3</a> |

## 11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## 重要なお知らせと免責事項

テキサス・インスツルメンツは、技術データと信頼性データ (データシートを含みます)、設計リソース (リファレンス デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、テキサス・インスツルメンツ製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した テキサス・インスツルメンツ製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとします。

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている テキサス・インスツルメンツ製品を使用するアプリケーションの開発の目的でのみ、テキサス・インスツルメンツはその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。テキサス・インスツルメンツや第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、テキサス・インスツルメンツおよびその代理人を完全に補償するものとし、テキサス・インスツルメンツは一切の責任を拒否します。

テキサス・インスツルメンツの製品は、[テキサス・インスツルメンツの販売条件](#)、または [ti.com](https://www.ti.com) やかかる テキサス・インスツルメンツ製品の関連資料などのいずれかを通じて提供する適用可能な条項の下で提供されています。テキサス・インスツルメンツがこれらのリソースを提供することは、適用されるテキサス・インスツルメンツの保証または他の保証の放棄の拡大や変更を意味するものではありません。

お客様がいかなる追加条項または代替条項を提案した場合でも、テキサス・インスツルメンツはそれらに異議を唱え、拒否します。

| DLPC231ZEKRQ1    | ACTIVE        | NFBGA        | ZEK                | 324  | 1000           | TBD             | Call TI                              | Call TI              | -40 to 105   | DLPC231ZEKQ1            | <a href="#">Samples</a> |

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

<sup>(2)</sup> **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "--" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

4228691/A 05/2022

## NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Dimension is measured at the maximum solder ball diameter parallel to datum plane C.
4. Datum C (Seating Plane) is defined by the spherical crowns of the solder balls.
5. Parallelism measurement shall exclude any effect of mark on the top surface of package.

# EXAMPLE BOARD LAYOUT

ZDQ0324A

BGA - 2.352 mm max height

BALL GRID ARRAY

4228691/A 05/2022

NOTES: (continued)

- Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints. For information, see Texas Instruments literature number SPRAA99 ([www.ti.com/lit/spraa99](http://www.ti.com/lit/spraa99)).

# EXAMPLE STENCIL DESIGN

ZDQ0324A

BGA - 2.352 mm max height

BALL GRID ARRAY

NOTES: (continued)

7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

LAND PATTERN EXAMPLE

SCALE: 8X

SOLDER MASK DETAILS

NOT TO SCALE

4228817/A 06/2022

NOTES: (continued)

- Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints. Refer to Texas Instruments Literature number SNVA009 ([www.ti.com/lit/snva009](http://www.ti.com/lit/snva009)).

# EXAMPLE STENCIL DESIGN

**ZEK0324A**

**NFBGA - 1.5 mm max height**

PLASTIC BALL GRID ARRAY

NOTES: (continued)

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.
