

LM2674 SIMPLE SWITCHER® 電力コンバータ、高効率、500mA、降圧型電圧レギュレータ

1 特長

- 新製品を利用可能:
 - LMR36506 3~65V、0.6A、200kHz~2.2MHz 同期整流コンバータ
- 市場投入の迅速化:
 - TPSM365R6 3~65V、0.6A、200kHz~2.2MHz 電源モジュール
- 最大効率 96%
- 8 ピンの SOIC、PDIP、および 16 ピンの WSON パッケージで供給
- 単純で設計が簡単
- 必要な外付け部品はわずか 5 個
- 容易に入手可能な標準インダクタを使用
- 3V、5V、12V および可変出力バージョン
- 1.21V~37V の可変バージョンの出力電圧範囲
- ラインおよび負荷条件の全域において $\pm 1.5\%$ の最大出力電圧許容範囲
- 出力負荷電流 500mA を保証
- 0.25 Ω DMOS 出力スイッチ
- 8V~40V の広い入力電圧範囲
- 260kHz 固定周波数の内部発振器
- TTL シャットダウン機能、低消費電力のスタンバイ・モード
- サーマル・シャットダウンおよび電流制限保護
- WEBENCH® Power Designer により、LM2674 を使用するカスタム設計を作成

2 アプリケーション

- 単純な高効率 (90% 超) の降圧型 (バック) レギュレータ
- リニア・レギュレータ用の高効率プリレギュレータ
- 正負反転コンバータ

3 概要

LM2674 シリーズのレギュレータは、LMDMOS プロセスで構築されたモノリシック IC です。これらのレギュレータは、降圧型 (バック) スイッチング・レギュレータのすべてのアクティブ機能を備えており、優れたラインおよび負荷レギュレーションで 500mA の負荷電流を駆動できます。3.3V、5V、12V の固定出力電圧と、可変出力電圧のバージョンがあります。

これらのレギュレータは、必要な外付け部品の数が最小限で、簡単に使用でき、特許取得の内部周波数補償と固定周波数発振器が内蔵されています。

LM2674 シリーズは 260kHz のスイッチング周波数で動作するため、周波数の低いスイッチング・レギュレータに比べて小型のフィルタ部品を使用できます。非常に効率が高いため (90% 超)、プリント基板の銅配線のみで十分なヒートシンクになります。

LM2674 とともに使用する標準インダクタがいくつかの製造元から入手可能です。このため、これらの先進 IC を使用するスイッチ・モード電源の設計が大幅に簡素化されます。データシートには、スイッチ・モード電源で動作するように設計されたダイオードおよびコンデンサの選択ガイドも記載されています。

パッケージ情報

部品番号	パッケージ (1)	パッケージ・サイズ (2)
LM2674	D (SOIC、8)	4.90mm × 3.91mm
	P (PDIP、8)	9.81mm × 6.35mm
	NHN (WSON、16)	5.00mm × 5.00mm

- 利用可能なすべてのパッケージについては、データシートの末尾にある注文情報を参照してください。
- パッケージ・サイズ (長さ × 幅) は公称値であり、該当する場合はピンも含まれます。

5 概要 (続き)

その他の特長として、指定された入力電圧および出力負荷の条件において出力電圧の許容誤差が確実に $\pm 1.5\%$ 、発振器の周波数の許容誤差が $\pm 10\%$ であることが挙げられます。外部シャットダウン機能を備えており、スタンバイ電流は標準値で $50\mu\text{A}$ です。出力スイッチには電流制限と、障害状態における完全な保護を行うためのサーマル・シャットダウンが含まれています。

6 Pin Configuration and Functions

図 6-1. D or P Package 8-Pin SOIC or PDIP Top View

Connect DAP to pin 11 and 12.

図 6-2. NHN Package 16-Pin WSON Top View

表 6-1. Pin Functions

NAME	PIN		I/O	DESCRIPTION
	SOIC, PDIP	WSON		
CB	1	1	I	Bootstrap capacitor connection for high-side driver. Connect a high-quality, 10-nF capacitor from CB to VSW Pin.
FB	4	8	I	Feedback sense input pin. Connect to the midpoint of feedback divider to set VOUT for ADJ version or connect this pin directly to the output capacitor for a fixed output version.
ON/ OFF	5	9	I	Enable input to the voltage regulator. High = ON and low = OFF. Pull this pin high or float to enable the regulator
VSW	8	15, 16	O	Source pin of the internal high-side FET. This is a switching node. Attached this pin to an inductor and the cathode of the external diode
GND	6	11, 12	—	Power ground pins. Connect to system ground. Ground pins of C_{IN} and C_{OUT} . Path to C_{IN} must be as short as possible.
VIN	7	14	I	Supply input pin to collector pin of high-side FET. Connect to power supply and input bypass capacitors C_{IN} . Path from VIN pin to high frequency bypass C_{IN} and GND must be as short as possible.
NC	2, 3	2, 3, 4, 5, 6, 7, 10, 13	—	No connect pins

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)^{(1) (2)}

			MIN	MAX	UNIT
Supply voltage				45	V
ON/ OFF pin voltage, V _{SH}			−0.1	6	V
Switch voltage to ground				−1	V
Boost pin voltage				V _{SW} + 8	V
Feedback pin voltage, V _{FB}			−0.3	14	V
Power dissipation			Internally Limited		
Lead temperature	D package	Vapor phase (60 s)	215		°C
		Infrared (15 s)	220		
	P package (soldering, 10 s)		260		
	WSO package		See AN-1187		
Maximum junction temperature				150	°C
Storage temperature, T _{stg}			−65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ^{(1) (2)}	±2000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) The human-body model is a 100-pF capacitor discharged through a 1.5-k Ω resistor into each pin.

7.3 Recommended Operating Conditions

			MIN	MAX	UNIT
Supply voltage			6.5	40	V
Junction temperature, T_J			−40	125	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LM2674			UNIT
		D (SOIC)	P (PDIP)	NHN (WSO)	
		8 PINS	8 PINS	16 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance ⁽²⁾	105	95	—	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
- (2) Junction to ambient thermal resistance with approximately 1 square inch of printed-circuit board copper surrounding the leads. Additional copper area lowers thermal resistance further. The value $R_{\theta JA}$ for the WSO (NHN) package is specifically dependent on PCB trace area, trace material, and the number of layers and thermal vias. For improved thermal resistance and power dissipation for the WSO package, see [AN-1187 Leadless Leadframe Package \(LLP\)](#).

7.5 Electrical Characteristics – 3.3-V Version

$T_J = 25^\circ\text{C}$ (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN ⁽³⁾	TYP ⁽²⁾	MAX ⁽³⁾	UNIT
SYSTEM PARAMETERS (see 9-1) ⁽¹⁾					
V_{OUT} Output voltage	$V_{IN} = 8\text{ V to }40\text{ V}$, $I_{LOAD} = 20\text{ mA to }500\text{ mA}$	$T_J = 25^\circ\text{C}$	3.251	3.3	3.35
		$T_J = -40^\circ\text{C to }125^\circ\text{C}$	3.201		3.399

		$T_J = -40^\circ\text{C to }125^\circ\text{C}$	3.201		3.399
η Efficiency	$V_{IN} = 12\text{ V}$, $I_{LOAD} = 500\text{ mA}$		86%		

- (1) External components such as the catch diode, inductor, input and output capacitors, and voltage programming resistors can affect switching regulator performance. When the LM2674 is used as shown in [9-1](#) and [9-5](#), system performance is as specified by the system parameters section of the Electrical Characteristics.
- (2) Typical numbers are at 25°C and represent the most likely norm.
- (3) All limits are used to calculate Average Outgoing Quality Level (AOQL).

7.6 Electrical Characteristics – 5-V Version

$T_J = 25^\circ\text{C}$ (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN ⁽³⁾	TYP ⁽²⁾	MAX ⁽³⁾	UNIT
SYSTEM PARAMETERS (see 9-1) ⁽¹⁾					
V_{OUT} Output voltage	$V_{IN} = 8\text{ V to }40\text{ V}$, $I_{LOAD} = 20\text{ mA to }500\text{ mA}$	$T_J = 25^\circ\text{C}$	4.925	5	5.075
		$T_J = -40^\circ\text{C to }125^\circ\text{C}$	4.85		5.15
	$V_{IN} = 6.5\text{ V to }40\text{ V}$, $I_{LOAD} = 20\text{ mA to }250\text{ mA}$	$T_J = 25^\circ\text{C}$	4.925	5	5.075
		$T_J = -40^\circ\text{C to }125^\circ\text{C}$	4.85		5.15
η Efficiency	$V_{IN} = 12\text{ V}$, $I_{LOAD} = 500\text{ mA}$		90%		

- (1) External components such as the catch diode, inductor, input and output capacitors, and voltage programming resistors can affect switching regulator performance. When the LM2674 is used as shown in [9-1](#) and [9-5](#), system performance is as specified by the system parameters section of the Electrical Characteristics.
- (2) Typical numbers are at 25°C and represent the most likely norm.
- (3) All limits are used to calculate Average Outgoing Quality Level (AOQL).

7.7 Electrical Characteristics – 12-V Version

$T_J = 25^\circ\text{C}$ (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN ⁽³⁾	TYP ⁽²⁾	MAX ⁽³⁾	UNIT
SYSTEM PARAMETERS (see 9-1) ⁽¹⁾					
V_{OUT} Output voltage	$V_{IN} = 15\text{ V to }40\text{ V}$, $I_{LOAD} = 20\text{ mA to }500\text{ mA}$	$T_J = 25^\circ\text{C}$	11.82	12	12.18
		$T_J = -40^\circ\text{C to }125^\circ\text{C}$	11.64		12.36
η Efficiency	$V_{IN} = 24\text{ V}$, $I_{LOAD} = 500\text{ mA}$		94%		

- (1) External components such as the catch diode, inductor, input and output capacitors, and voltage programming resistors can affect switching regulator performance. When the LM2674 is used as shown in [9-1](#) and [9-5](#), system performance is as specified by the system parameters section of the Electrical Characteristics.
- (2) Typical numbers are at 25°C and represent the most likely norm.
- (3) All limits are used to calculate Average Outgoing Quality Level (AOQL).

7.8 Electrical Characteristics – Adjustable Voltage Version

$T_J = 25^\circ\text{C}$ (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN ⁽³⁾	TYP ⁽²⁾	MAX ⁽³⁾	UNIT
SYSTEM PARAMETERS (see Figure 9-5) ⁽¹⁾					
V_{FB} Feedback voltage	$V_{IN} = 8\text{ V to }40\text{ V}$, $I_{LOAD} = 20\text{ mA to }500\text{ mA}$, V_{OUT} programmed for 5 V (see Figure 9-5)	$T_J = 25^\circ\text{C}$	1.192	1.21	1.228
		$T_J = -40^\circ\text{C to }125^\circ\text{C}$	1.174		1.246
	$V_{IN} = 6.5\text{ V to }40\text{ V}$, $I_{LOAD} = 20\text{ mA to }250\text{ mA}$, V_{OUT} programmed for 5 V (see Figure 9-5)	$T_J = 25^\circ\text{C}$	1.192	1.21	1.228
		$T_J = -40^\circ\text{C to }125^\circ\text{C}$	1.174		1.246
η Efficiency	$V_{IN} = 12\text{ V}$, $I_{LOAD} = 500\text{ mA}$		90%		

- (1) External components such as the catch diode, inductor, input and output capacitors, and voltage programming resistors can affect switching regulator performance. When the LM2674 is used as shown in [Figure 9-1](#) and [Figure 9-5](#), system performance is as specified by the system parameters section of the Electrical Characteristics.
- (2) Typical numbers are at 25°C and represent the most likely norm.
- (3) All limits are used to calculate Average Outgoing Quality Level (AOQL).

7.9 Electrical Characteristics – All Output Voltage Versions

$T_J = 25^\circ\text{C}$, $V_{IN} = 12\text{ V}$ for the 3.3-V, 5-V, and adjustable versions and $V_{IN} = 24\text{ V}$ for the 12-V version, and $I_{LOAD} = 100\text{ mA}$ (unless otherwise noted)

PARAMETERS	TEST CONDITIONS	MIN	TYP	MAX	UNIT
DEVICE PARAMETERS					
I_Q Quiescent current	$V_{FEEDBACK} = 8\text{ V}$ for 3.3-V, 5-V, and adjustable voltage versions		2.5	3.6	mA
	$V_{FEEDBACK} = 15\text{ V}$ for 12-V versions		2.5		mA
I_{STBY} Standby quiescent current	ON/ $\overline{\text{OFF}}$ pin = 0 V	$T_J = 25^\circ\text{C}$	50	100	μA
		$T_J = -40^\circ\text{C to }125^\circ\text{C}$		150	
I_{CL} Current limit	$T_J = 25^\circ\text{C}$	0.62	0.8	1.2	A
	$T_J = -40^\circ\text{C to }125^\circ\text{C}$	0.575		1.25	
I_L Output leakage current	$V_{IN} = 40\text{ V}$, ON/ $\overline{\text{OFF}}$ pin = 0 V, $V_{SWITCH} = 0\text{ V}$		1	25	μA
	$V_{SWITCH} = -1\text{ V}$, ON/ $\overline{\text{OFF}}$ pin = 0 V		6	15	mA
$R_{DS(ON)}$ Switch ON-resistance	$I_{SWITCH} = 500\text{ mA}$	$T_J = 25^\circ\text{C}$	0.25	0.4	Ω
		$T_J = -40^\circ\text{C to }125^\circ\text{C}$		0.6	
f_O Oscillator frequency	Measured at switch pin	$T_J = 25^\circ\text{C}$	260		kHz
		$T_J = -40^\circ\text{C to }125^\circ\text{C}$	225	275	
D	Maximum duty cycle		95%		
	Minimum duty cycle		0%		
I_{BIAS} Feedback bias current	$V_{FEEDBACK} = 1.3\text{ V}$ (adjustable version only)		85		nA
$V_{S/D}$ ON/ $\overline{\text{OFF}}$ pin voltage threshold	Turnon threshold, rising ⁽¹⁾	$T_J = 25^\circ\text{C}$	1.4		V
		$T_J = -40^\circ\text{C to }125^\circ\text{C}$	0.8	2	
$I_{S/D}$ ON/ $\overline{\text{OFF}}$ pin current	ON/ $\overline{\text{OFF}}$ pin = 0 V	$T_J = 25^\circ\text{C}$	20		μA
		$T_J = -40^\circ\text{C to }125^\circ\text{C}$	7	37	

- (1) The ON/ $\overline{\text{OFF}}$ pin is internally pulled up to 7 V and can be left floating for always-on operation.

8 Detailed Description

8.1 Overview

The LM2674 SIMPLE SWITCHER® power converter regulator is an easy-to-use non-synchronous step-down DC-DC converter with a wide input voltage range up to 40 V. The LM2674 is capable of delivering up to 0.5-A DC load current with excellent line and load regulation. These devices are available in fixed output voltages of 3.3 V, 5 V, 12 V, and an adjustable output version. The family requires few external components and the pin arrangement was designed for simple, optimum PCB layout.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Adjustable Output Voltage

The voltage regulation loop in the LM2674 regulates output voltage by maintaining the voltage on FB pin (VFB) to be the same as the internal REF voltage (VREF). A resistor divider pair is required to program the ratio from output voltage VOUT to VFB. The resistor is connected from the VOUT of the LM2674 to ground with the mid-point connecting to the FB pin. The voltage reference system produces a precise voltage reference over temperature. The internal REF voltage is 1.21 V typically. To program the output voltage of the LM2674 to be a certain value VOUT, R1 can be calculated with a selected R2 (see [Adjustable Output Voltage Typical Application](#)). R2 is in the range from 10 kΩ to 100 kΩ is recommended for most applications. If the resistor divider is not connected properly, output voltage cannot be regulated because the feedback loop is broken. If the FB pin is shorted to ground, the output voltage is driven close to VIN, because the regulator sees very low voltage on the FB pin and tries to regulator it up. The load connected to the output can be damaged under such a condition. Do not short FB pin to ground when the LM2674 is enabled. It is important to route the feedback trace away from the noisy area of the PCB. For more layout recommendations, see [Layout](#).

8.4 Device Functional Modes

8.4.1 Shutdown Mode

The ON/ $\overline{\text{OFF}}$ pin provides electrical ON and OFF control for the LM2674. When the voltage of this pin is lower than 1.4 V, the device is in shutdown mode. The typical standby current in this mode is 50 μA .

8.4.2 Active Mode

When the voltage of the ON/OFF pin is higher than 1.4 V, the device starts switching and the output voltage rises until it reaches a normal regulation voltage.

9 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

9.1 Application Information

The LM2674 is a step-down DC-DC regulator. The LM2674 is typically used to convert a higher DC voltage to a lower DC voltage with a maximum output current of 0.5 A. The following design procedure can be used to select components for the LM2674. Alternately, the WEBENCH® software can be used to generate complete designs. When generating a design, the WEBENCH software uses iterative design procedure and accesses comprehensive databases of components. See ti.com for more details.

When the output voltage is greater than approximately 6 V, and the duty cycle at minimum input voltage is greater than approximately 50%, the designer must exercise caution in selection of the output filter components. When an application designed to these specific operating conditions is subjected to a current limit fault condition, observing a large hysteresis in the current limit is possible. This can affect the output voltage of the device until the load current is reduced sufficiently to allow the current limit protection circuit to reset itself.

Under current limiting conditions, the LM267x is designed to respond in the following manner:

1. At the moment when the inductor current reaches the current limit threshold, the ON-pulse is immediately terminated. This happens for any application condition.
2. However, the current limit block is also designed to momentarily reduce the duty cycle to below 50% to avoid subharmonic oscillations, which can cause the inductor to saturate.
3. Thereafter, after the inductor current falls below the current limit threshold, there is a small relaxation time during which the duty cycle progressively rises back above 50% to the value required to achieve regulation.

If the output capacitance is sufficiently *large*, as the output tries to recover, the output capacitor charging current can be large enough to repeatedly re-trigger the current limit circuit before the output has fully settled. This condition is exacerbated with higher output voltage settings because the energy requirement of the output capacitor varies as the square of the output voltage ($\frac{1}{2} CV^2$), thus requiring an increased charging current. A simple test to determine if this condition can exist for a suspect application is to apply a short circuit across the output of the converter, and then remove the shorted output condition. In an application with properly selected external components, the output recovers smoothly. Practical values of external components that have been experimentally found to work well under these specific operating conditions are $C_{OUT} = 47 \mu F$, $L = 22 \mu H$.

注

Even with these components, for a device current limit of ICLIM, the maximum load current under which the possibility of the large current limit hysteresis can be minimized is ICLIM/2.

For example, if the input is 24 V and the set output voltage is 18 V, then for a desired maximum current of 1.5 A, the current limit of the chosen switcher must be confirmed to be at least 3 A. Under extreme overcurrent or short-circuit conditions, the LM267X employs frequency foldback in addition to the current limit. If the cycle-by-cycle inductor current increases above the current limit threshold (due to short circuit or inductor saturation for example) the switching frequency is automatically reduced to protect the IC. Frequency below 100 kHz is typical for an extreme short-circuit condition.

9.2 Typical Applications

9.2.1 Fixed Output Voltage Typical Application

C_{IN} = 22- μ F, 50-V Tantalum, Sprague 199D Series
 C_{OUT} = 47- μ F, 25-V Tantalum, Sprague 595D Series
 $D1$ = 3.3-A, 50-V Schottky Rectifier, IR 30WQ05F
 $L1$ = 68- μ H Sumida #RCR110D-680L
 C_B = 0.01- μ F, 50-V Ceramic

图 9-1. Fixed Output Voltage Version

9.2.1.1 Design Requirements

表 9-1 lists the design parameters of this example.

表 9-1. Design Parameters

PARAMETER	VALUE
Regulated output voltage (3.3 V, 5 V, or 12 V), V_{OUT}	5 V
Maximum DC input voltage, $V_{IN(max)}$	12 V
Maximum load current, $I_{LOAD(max)}$	500 mA

9.2.1.2 Detailed Design Procedure

9.2.1.2.1 Custom Design with WEBENCH® Tools

[Click here](#) to create a custom design using the LM2674 devices with the WEBENCH Power Designer.

1. Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

9.2.1.2.2 Inductor Selection (L1)

1. Select the correct inductor value selection guide from [Figure 9-10](#), [Figure 9-11](#), or [Figure 9-12](#) (output voltages of 3.3 V, 5 V, or 12 V respectively). For all other voltages, see the design procedure for the adjustable version. Use the inductor selection guide for the 5-V version shown in [Figure 9-11](#).
2. From the inductor value selection guide, identify the inductance region intersected by the maximum input voltage line and the maximum load current line. Each region is identified by an inductance value and an inductor code (LXX). From the inductor value selection guide shown in [Figure 9-11](#), the inductance region intersected by the 12-V horizontal line and the 500-mA vertical line is 47 μ H, and the inductor code is L13.
3. Select an appropriate inductor from the four manufacturer's part numbers listed in [Table 9-7](#). Each manufacturer makes a different style of inductor to allow flexibility in meeting various design requirements. Listed below are some of the differentiating characteristics of each manufacturer's inductors:
 - *Schott*: ferrite EP core inductors; these have very low leakage magnetic fields to reduce electro-magnetic interference (EMI) and are the lowest power loss inductors
 - *Renco*: ferrite stick core inductors; benefits are typically lowest cost inductors and can withstand E•T and transient peak currents above rated value. Be aware that these inductors have an external magnetic field which can generate more EMI than other types of inductors.
 - *Pulse*: powdered iron toroid core inductors; these can also be low cost and can withstand larger than normal E•T and transient peak currents. Toroid inductors have low EMI.
 - *Coilcraft*: ferrite drum core inductors; these are the smallest physical size inductors, available only as SMT components. Be aware that these inductors also generate EMI—but less than stick inductors.

Complete specifications for these inductors are available from the respective manufacturers. The inductance value required is 47 μ H. From [Table 9-7](#), go to the L13 line and choose an inductor part number from any of the four manufacturers shown. (In most instances, both through hole and surface mount inductors are available).

9.2.1.2.3 Output Capacitor Selection (C_{OUT})

Select an output capacitor from the output capacitor [Table 9-2](#). Using the output voltage and the inductance value found in the inductor selection guide, step 1, locate the appropriate capacitor value and voltage rating. Use the 5-V section in the output capacitor [Table 9-2](#). Choose a capacitor value and voltage rating from the line that contains the inductance value of 47 μ H. The capacitance and voltage rating values corresponding to the 47- μ H inductor are the following:

- Surface mount
 - 68- μ F, 10-V Sprague 594D series
 - 100- μ F, 10-V AVX TPS series
- Through hole
 - 68- μ F, 10-V Sanyo OS-CON SA series
 - 150- μ F, 35-V Sanyo MV-GX series
 - 150- μ F, 35-V Nichicon PL series
 - 150- μ F, 35-V Panasonic HFQ series

The capacitor list contains through-hole electrolytic capacitors from four different capacitor manufacturers and surface-mount tantalum capacitors from two different capacitor manufacturers. TI recommends that both the manufacturers and the manufacturer's series that are listed in the table be used.

表 9-2. Output Capacitor Table

OUTPUT VOLTAGE (V)	INDUCTANCE (μH)	OUTPUT CAPACITOR					
		SURFACE MOUNT		THROUGH HOLE

	220	47/20	68/20	47/20	120/35	120/35	120/35

9.2.1.2.4 Catch Diode Selection (D1)

- In normal operation, the average current of the catch diode is the load current times the catch diode duty cycle, 1-D (D is the switch duty cycle, which is approximately the output voltage divided by the input voltage). The largest value of the catch diode average current occurs at the maximum load current and maximum input voltage (minimum D). For normal operation, the catch diode current rating must be at least 1.3 times greater than its maximum average current. However, if the power supply design must withstand a continuous output short, the diode must have a current rating equal to the maximum current limit of the LM2674. The most stressful condition for this diode is a shorted output condition. Refer to 表 9-3. In this example, a 1-A, 20-V Schottky diode provides the best performance. If the circuit must withstand a continuous shorted output, TI recommends a higher current Schottky diode.

表 9-3. Schottky Diode Selection Table

V _R	500-mA DIODES		3-A DIODES	
	SURFACE MOUNT	THROUGH- HOLE	SURFACE MOUNT	THROUGH- HOLE
20V	SK12	1N5817	SK32	1N5820
	B120	SR102		SR302
30V	SK13	1N5818	SK33	1N5821
	B130	11DQ03	30WQ03F	31DQ03
	MBRS130	SR103

	10BQ050	SR105		SR305

- The reverse voltage rating of the diode must be at least 1.25 times the maximum input voltage.
- Because of their fast switching speed and low forward voltage drop, Schottky diodes provide the best performance and efficiency. This Schottky diode must be placed close to the LM2674 using short leads and short printed-circuit traces.

9.2.1.2.5 Input Capacitor (C_{IN})

A low ESR aluminum or tantalum bypass capacitor is required between the input pin and ground to prevent large voltage transients from appearing at the input. This capacitor must be placed close to the IC using short leads. In addition, the RMS current rating of the input capacitor must be selected to be at least $\frac{1}{2}$ the DC load current. The capacitor manufacturer data sheet must be checked to assure that this current rating is not exceeded. The curves shown in [Figure 9-2](#) show typical RMS current ratings for several different aluminum electrolytic capacitor values. A parallel connection of two or more capacitors can be required to increase the total minimum RMS current rating to suit the application requirements.

**图 9-2. RMS Current Ratings for Low ESR Electrolytic Capacitors (Typical)**

For an aluminum electrolytic capacitor, the voltage rating must be at least 1.25 times the maximum input voltage. Caution must be exercised if solid tantalum capacitors are used. The tantalum capacitor voltage rating must be twice the maximum input voltage. [Table 9-4](#) and [Table 9-5](#) show the recommended application voltage for AVX TPS and Sprague 594D tantalum capacitors. TI recommends that they be surge current tested by the manufacturer. The TPS series available from AVX, and the 593D and 594D series from Sprague are all surge current tested. Another approach to minimize the surge current stresses on the input capacitor is to add a small inductor in series with the input supply line.

表 9-4. AVX TPS

RECOMMENDED APPLICATION VOLTAGE ⁽¹⁾	VOLTAGE RATING

24	35
29	50

(1) Recommended Application Voltage for AVX TPS and Sprague 594D Tantalum Chip Capacitors Derated for 85°C

Use caution when using only ceramic capacitors for input bypassing, because it can cause severe ringing at the V_{IN} pin. The important parameters for the input capacitor are the input voltage rating and the RMS current rating. With a maximum input voltage of 12 V, an aluminum electrolytic capacitor with a voltage rating greater than 15 V ($1.25 \times V_{IN}$) is required. The next higher capacitor voltage rating is 16 V.

The RMS current rating requirement for the input capacitor in a buck regulator is approximately $\frac{1}{2}$ the DC load current. In this example, with a 500-mA load, a capacitor with an RMS current rating of at least 250 mA is required. The curves shown in [図 9-2](#) can be used to select an appropriate input capacitor. From the curves, locate the 16-V line and note which capacitor values have RMS current ratings greater than 250 mA.

For a through-hole design, a 100- μ F, 16-V electrolytic capacitor (Panasonic HFQ series, Nichicon PL, Sanyo MV-GX series or equivalent) is adequate. Other types or other manufacturers' capacitors can be used provided the RMS ripple current ratings are adequate. Additionally, for a complete surface mount design, electrolytic capacitors such as the Sanyo CV-C or CV-BS and the Nichicon WF or UR and the NIC Components NACZ series can be considered.

For surface mount designs, solid tantalum capacitors can be used, but caution must be exercised with regard to the capacitor surge current rating and voltage rating. In this example, checking [表 9-4](#), and the Sprague 594D series datasheet, a Sprague 594D 15- μ F, 25-V capacitor is adequate.

9.2.1.2.6 Boost Capacitor (C_B)

This capacitor develops the necessary voltage to turn the switch gate on fully. All applications must use a 0.01- μ F, 50-V ceramic capacitor. For this application, and all applications, use a 0.01- μ F, 50-V ceramic capacitor.

9.2.1.3 Application Curves

Continuous mode switching waveforms $V_{IN} = 20\text{ V}$, $V_{OUT} = 5\text{ V}$, $I_{LOAD} = 500\text{ mA}$, $L = 100\text{ }\mu\text{H}$, $C_{OUT} = 100\text{ }\mu\text{F}$, $C_{OUT}ESR = 0.1\text{ }\Omega$

A: V_{SW} pin voltage = 10 V/div

B: Inductor current = 0.2 A/div

C: Output ripple voltage = 50 mV/div ac-coupled

Figure 9-3. Horizontal Time Base: 1 $\mu\text{s}/\text{div}$

Load transient response for continuous mode $V_{IN} = 20\text{ V}$, $V_{OUT} = 5\text{ V}$, $L = 100\text{ }\mu\text{H}$, $C_{OUT} = 100\text{ }\mu\text{F}$, $C_{OUT}ESR = 0.1\text{ }\Omega$

A: Output voltage = 100 mV/div, ac-coupled

B: Load current = 100-mA to 500-mA load pulse

Figure 9-4. Horizontal Time Base: 50 $\mu\text{s}/\text{div}$

9.2.2 Adjustable Output Voltage Typical Application

C_{IN} = 22- μ F, 50-V Tantalum, Sprague 199D Series

C_{OUT} = 47- μ F, 25-V Tantalum, Sprague 595D Series

D1 = 3.3-A, 50-V Schottky Rectifier, IR 30WQ05F

L1 = 68- μ H Sumida #RCR110D-680L

R1 = 1.5 k Ω , 1%

C_B = 0.01- μ F, 50-V Ceramic

For a 5-V output, select R2 to be 4.75 k Ω , 1%

$$V_{OUT} = V_{REF} \left(1 + \frac{R_2}{R_1} \right)$$

where V_{REF} = 1.21 V

$$R_2 = R_1 \left(\frac{V_{OUT}}{V_{REF}} - 1 \right)$$

Use a 1% resistor for best stability.

图 9-5. Adjustable Output Voltage Version

9.2.2.1 Design Requirements

表 9-6 lists the design parameters of this example.

表 9-6. Design Parameters

PARAMETER	VALUE
Regulated output voltage, V_{OUT}	20
Maximum input voltage, $V_{IN(max)}$	28
Maximum load current, $I_{LOAD(max)}$	500
Switching frequency, F	Fixed at a nominal 260 kHz

9.2.2.2 Detailed Design Procedure

9.2.2.2.1 Programming Output Voltage

Select R₁ and R₂, as shown in 图 9-5.

Use the following formula to select the appropriate resistor values.

$$V_{OUT} = V_{REF} \left(1 + \frac{R_2}{R_1} \right) \quad (1)$$

where

$$\bullet \quad V_{REF} = 1.21 \text{ V}$$

Select a value for R_1 between 240 Ω and 1.5 k Ω . The lower resistor values minimize noise pickup in the sensitive feedback pin. (For the lowest temperature coefficient and the best stability with time, use 1% metal film resistors.)

$$R_2 = R_1 \left(\frac{V_{OUT}}{V_{REF}} - 1 \right) \quad (2)$$

Select R_1 to be 1 k Ω , 1%. Solve for R_2 .

$$R_2 = R_1 \left(\frac{V_{OUT}}{V_{REF}} - 1 \right) = 1 \text{ k}\Omega \left(\frac{20\text{V}}{1.23\text{V}} - 1 \right) \quad (3)$$

where

- $R_2 = 1\text{k} (16.53 - 1) = 15.53 \text{ k}\Omega$, closest 1% value is 15.4 k Ω
- $R_2 = 15.4 \text{ k}\Omega$

9.2.2.2.2 Inductor Selection (L1)

- Calculate the inductor Volt • microsecond constant $E \cdot T$ (V • μs) from 式 4.

$$E \cdot T = (V_{IN(MAX)} - V_{OUT} - V_{SAT}) \cdot \frac{V_{OUT} + V_D}{V_{IN(MAX)} - V_{SAT} + V_D} \cdot \frac{1000}{260} \text{ (V} \cdot \mu\text{s)} \quad (4)$$

where

- V_{SAT} = internal switch saturation voltage = 0.25 V
- V_D = diode forward voltage drop = 0.5 V

Calculate the inductor Volt • microsecond constant ($E \cdot T$) with 式 5.

$$\begin{aligned} E \cdot T &= (28 - 20 - 0.25) \cdot \frac{20 + 0.5}{28 - 0.25 + 0.5} \cdot \frac{1000}{260} \text{ (V} \cdot \mu\text{s)} \\ E \cdot T &= (7.75) \cdot \frac{20.5}{28.25} \cdot 3.85 \text{ (V} \cdot \mu\text{s)} = 21.6 \text{ (V} \cdot \mu\text{s)} \end{aligned} \quad (5)$$

- Use the $E \cdot T$ value from the previous formula and match it with the $E \cdot T$ number on the vertical axis of the inductor value selection guide shown in 图 9-13.

$$E \cdot T = 21.6 \text{ (V} \cdot \mu\text{s)}$$

- On the horizontal axis, select the maximum load current.

$$I_{LOAD(max)} = 500 \text{ mA}$$

- Identify the inductance region intersected by the $E \cdot T$ value and the maximum load current value. Each region is identified by an inductance value and an inductor code (LXX).

From the inductor value selection guide shown in 图 9-13, the inductance region intersected by the 21.6 (V • μs) horizontal line and the 500-mA vertical line is 100 μH , and the inductor code is L20.

- Select an appropriate inductor from the four manufacturer's part numbers listed in 表 9-7. For information on the different types of inductors, see the inductor selection in the fixed output voltage design procedure.

From 表 9-7, locate line L20, and select an inductor part number from the list of manufacturers' part numbers.

9.2.2.2.3 Output Capacitor Selection (C_{OUT})

1. Select an output capacitor from the capacitor code selection guide in 表 9-8. Using the inductance value found in the inductor selection guide, step 1, locate the appropriate capacitor code corresponding to the desired output voltage. Use the appropriate row of the capacitor code selection guide, in 表 9-8. For this example, use the 15-V to 20-V row. The capacitor code corresponding to an inductance of 100 μ H is C20.
2. Select an appropriate capacitor value and voltage rating, using the capacitor code, from the output capacitor selection in 表 9-9. There are two solid tantalum (surface-mount) capacitor manufacturers and four electrolytic (through-hole) capacitor manufacturers to choose from. TI recommends that both the manufacturers and the manufacturer's series that are listed in the table be used. From the output capacitor selection in 表 9-9, choose a capacitor value (and voltage rating) that intersects the capacitor code(s) selected in section A, C20.

The capacitance and voltage rating values corresponding to the capacitor code C20 are the following:

- Surface mount
 - 33- μ F, 25-V Sprague 594D series
 - 33- μ F, 25-V AVX TPS series
- Through hole
 - 33- μ F, 25-V Sanyo OS-CON SC series
 - 120- μ F, 35-V Sanyo MV-GX series
 - 120- μ F, 35-V Nichicon PL series
 - 20- μ F, 35-V Panasonic HFQ series

Other manufacturers or other types of capacitors can also be used, provided the capacitor specifications (especially the 100-kHz ESR) closely match the characteristics of the capacitors listed in the output capacitor table. Refer to the capacitor manufacturers' data sheet for this information.

(1) The SC series of Os-Con capacitors (others are SA series)

(2) The voltage ratings of the surface mount tantalum chip and Os-Con capacitors are too low to work at these voltages.

9.2.2.2.4 Catch Diode Selection (D1)

1. In normal operation, the average current of the catch diode is the load current times the catch diode duty cycle, $1-D$ (D is the switch duty cycle, which is approximately V_{OUT}/V_{IN}). The largest value of the catch diode average current occurs at the maximum input voltage (minimum D). For normal operation, the catch diode current rating must be at least 1.3 times greater than its maximum average current. However, if the power supply design must withstand a continuous output short, the diode must have a current rating greater than the maximum current limit of the LM2674. The most stressful condition for this diode is a shorted output condition. Schottky diodes provide the best performance, and in this example a 500-mA, 40-V Schottky diode is a good choice. If the circuit must withstand a continuous shorted output, TI recommends a higher current (at least 1.2 A) Schottky diode.
2. The reverse voltage rating of the diode must be at least 1.25 times the maximum input voltage.
3. Because of their fast switching speed and low forward voltage drop, Schottky diodes provide the best performance and efficiency. The Schottky diode must be placed close to the LM2674 using short leads and short printed-circuit traces.

9.2.2.2.5 Input Capacitor (C_{IN})

A low ESR aluminum or tantalum bypass capacitor is required between the input pin and ground to prevent large voltage transients from appearing at the input. This capacitor must be placed close to the IC using short leads. In addition, the RMS current rating of the input capacitor must be selected to be at least $\frac{1}{2}$ the DC load current. The capacitor manufacturer data sheet must be checked to assure that this current rating is not exceeded. The curves shown in [Figure 9-6](#) show typical RMS current ratings for several different aluminum electrolytic capacitor values. A parallel connection of two or more capacitors can be required to increase the total minimum RMS current rating to suit the application requirements.

Figure 9-6. RMS Current Ratings for Low ESR Electrolytic Capacitors (Typical)

For an aluminum electrolytic capacitor, the voltage rating must be at least 1.25 times the maximum input voltage. Caution must be exercised if solid tantalum capacitors are used. The tantalum capacitor voltage rating must be twice the maximum input voltage. [Table 9-10](#) and [Table 9-5](#) show the recommended application voltage for AVX TPS and Sprague 594D tantalum capacitors. TI also recommends that they be surge current tested by the manufacturer. The TPS series available from AVX, and the 593D and 594D series from Sprague are all surge current tested. Another approach to minimize the surge current stresses on the input capacitor is to add a small inductor in series with the input supply line.

18	25
24	35
29	50

(1) Recommended Application Voltage for AVX TPS and Sprague 594D Tantalum Chip Capacitors Derated for 85°C

Use caution when using only ceramic capacitors for input bypassing, because it can cause severe ringing at the V_{IN} pin. The important parameters for the input capacitor are the input voltage rating and the RMS current rating. With a maximum input voltage of 28 V, an aluminum electrolytic capacitor with a voltage rating of at least 35 V ($1.25 \times V_{IN}$) is required.

The RMS current rating requirement for the input capacitor in a buck regulator is approximately $\frac{1}{2}$ the DC load current. In this example, with a 500-mA load, a capacitor with an RMS current rating of at least 250 mA is required. The curves shown in [Figure 9-2](#) can be used to select an appropriate input capacitor. From the curves, locate the 35-V line and note which capacitor values have RMS current ratings greater than 250 mA.

For a through-hole design, a 68- μ F, 35-V electrolytic capacitor (Panasonic HFQ series, Nichicon PL, Sanyo MV-GX series or equivalent) is adequate. Other types or other manufacturers' capacitors can be used provided the RMS ripple current ratings are adequate. Additionally, for a complete surface mount design, electrolytic capacitors such as the Sanyo CV-C or CV-BS, and the Nichicon WF or UR and the NIC Components NACZ series can be considered.

For surface mount designs, solid tantalum capacitors can be used, but caution must be exercised with regard to the capacitor surge current rating and voltage rating. In this example, checking note 1 of [Table 9-5](#), and the Sprague 594D series datasheet, a Sprague 594D 15- μ F, 50-V capacitor is adequate.

9.2.2.2.6 Boost Capacitor (C_B)

This capacitor develops the necessary voltage to turn the switch gate on fully. All applications must use a 0.01- μ F, 50-V ceramic capacitor. For this application, and all applications, use a 0.01- μ F, 50-V ceramic capacitor.

9.2.2.3 Application Curves

Discontinuous mode switching waveforms $V_{IN} = 20\text{ V}$, $V_{OUT} = 5\text{ V}$, $I_{LOAD} = 300\text{ mA}$, $L = 15\text{ }\mu\text{H}$, $C_{OUT} = 68\text{ }\mu\text{F}$ (2 $\times$), $C_{OUTESR} = 25\text{ m}\Omega$

A: V_{SW} pin voltage = 10 V/div

B: Inductor current = 0.5 A/div

C: Output ripple voltage = 20 mV/div ac-coupled

FIG 9-7. Horizontal Time Base: 1 $\mu\text{s}/\text{div}$

Load transient response for discontinuous mode $V_{IN} = 20\text{ V}$, $V_{OUT} = 5\text{ V}$, $L = 47\text{ }\mu\text{H}$, $C_{OUT} = 68\text{ }\mu\text{F}$, $C_{OUTESR} = 50\text{ m}\Omega$

A: Output voltage = 100 mV/div, ac-coupled

B: Load current = 100-mA to 400-mA load pulse

FIG 9-8. Horizontal Time Base: 200 $\mu\text{s}/\text{div}$

FIG 9-13. LM2674, Adjustable Version

9.3 Power Supply Recommendations

The LM2674 is designed to operate from an input voltage supply up to 40 V. This input supply must be well regulated and able to withstand maximum input current and maintain a stable voltage.

9.4 Layout

9.4.1 Layout Guidelines

Layout is very important in switching regulator designs. Rapidly switching currents associated with wiring inductance can generate voltage transients which can cause problems. For minimal inductance and ground loops, the wires indicated by heavy lines (in FIG 9-1 and FIG 9-5) must be wide printed-circuit traces and must be kept as short as possible. For best results, external components must be placed as close to the switcher IC as possible using ground plane construction or single point grounding.

If open core inductors are used, take special care as to the location and positioning of this type of inductor. Allowing the inductor flux to intersect sensitive feedback, IC ground path, and C_{OUT} wiring can cause problems.

When using the adjustable version, take special care as to the location of the feedback resistors and the associated wiring. Physically place both resistors near the IC, and route the wiring away from the inductor, especially an open core type of inductor.

9.4.1.1 WSON Package Devices

The LM2674 is offered in the 16-pin WSON surface mount package to allow for increased power dissipation compared to the 8-pin SOIC and PDIP.

The die attach pad (DAP) must be connected to PCB ground plane. For CAD and assembly guidelines refer to [AN-1187 Leadless Leadframe Package \(LLP\)](#) application report.

9.4.2 Layout Examples

C_{IN} = 15- μ F, 25-V, Solid Tantalum Sprague 594D series

10 Device and Documentation Support

10.1 Device Support

10.1.1 Development Support

For development support see the following:

- For TI's WEBENCH Design Environment, visit the [WEBENCH Design Center](#)

10.1.1.1 Custom Design with WEBENCH® Tools

[Click here](#) to create a custom design using the LM2674 devices with the WEBENCH Power Designer.

- Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
- Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
- Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

10.2 Documentation Support

10.2.1 Related Documentation

For related documentation see the following:

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of ≤ 1000 ppm threshold. Antimony trioxide based flame retardants must also meet the ≤ 1000 ppm threshold requirement.

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TI は、技術データと信頼性データ (データシートを含みます)、設計リソース (リファレンス・デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、TI 製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した TI 製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとしします。

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている TI 製品を使用するアプリケーションの開発の目的でのみ、TI はその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。TI や第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、TI およびその代理人を完全に補償するものとし、TI は一切の責任を拒否します。

TI の製品は、[TI の販売条件](#)、または [ti.com](#) やかかる TI 製品の関連資料などのいずれかを通じて提供する適用可能な条項の下で提供されています。TI がこれらのリソースを提供することは、適用される TI の保証または他の保証の放棄の拡大や変更を意味するものではありません。

お客様がいかなる追加条項または代替条項を提案した場合でも、TI はそれらに異議を唱え、拒否します。
