

OPA2626 高速、高精度、低歪みの 16 ビット / 18 ビット A/D コンバータ (ADC) ドライバ

1 特長

- 非常に優れた動的性能
 - 低歪み: 100kHz において HD2 で -122dBc 、HD3 で -140dBc
 - ゲイン帯域幅 ($G = 100$): 120MHz
 - スルーレート: 115 V/ μs
 - 4V ステップでの 16 ビット・セトリング: 280ns
 - 低い電圧ノイズ: 10 kHz で $2.5\text{nV}/\sqrt{\text{Hz}}$
 - 低い出力インピーダンス: 1MHz において 1 Ω
- 非常に優れた DC 精度
 - オフセット電圧: $\pm 100\mu\text{V}$ (最大値)
 - オフセット電圧ドリフト: $\pm 3\mu\text{V}/^\circ\text{C}$ (最大値)
 - 低い静止電流: 2mA (標準値)
- 負レールを含む入力同相範囲
- レール・ツー・レール出力
- 広い温度範囲: $-40^\circ\text{C} \sim +125^\circ\text{C}$ で完全に動作を規定

2 アプリケーション

- 高精度 SAR ADC ドライバ
- 高精度の基準電圧バッファ
- プログラマブル・ロジック・コントローラ
- 試験および計測機器
- 科学計測機器
- 高スループットのデータ・アキュイジション・システム
- 高密度の多重化されたデータ・アキュイジション・システム

3 概要

OPA2626 オペアンプは、全高調波歪み (THD) とノイズが少ない 16 ビットおよび 18 ビット高精度逐次比較型 (SAR) アナログ / デジタル・コンバータ (ADC) ドライバです。このオペアンプは、真の 16 ビット実効ビット数 (ENOB) を実現できる 280ns の 16 ビット・セトリング時間で仕様が完全に規定されています。わずか $100\mu\text{V}$ のオフセット電圧という高い DC 精度、120MHz の広いゲイン帯域幅積、わずか $2.5\text{nV}/\sqrt{\text{Hz}}$ の優れた広帯域ノイズ特性を備えたこのデバイスは、ADS88xx SAR ADC ファミリーなどの高スループット高分解能 SAR ADC を駆動するために最適化されています。

OPA2626 は小型の 8 ピン VSSOP パッケージで供給され、 $-40^\circ\text{C} \sim +125^\circ\text{C}$ で動作が規定されています。

製品情報⁽¹⁾

型番	パッケージ	本体サイズ (公称)
OPA2626	VSSOP (8)	3.00mm×3.00mm

(1) 利用可能なすべてのパッケージについては、このデータシートの末尾にあるパッケージ・オプションについての付録を参照してください。

SAR ADC ドライバ

高忠実度のトポロジによる 動的性能の改善

($f_{\text{IN}} = 10\text{kHz}$ 、1MSPS FFT)

4 改訂履歴

2016年7月発行のものから更新

Page

•	ドキュメントから OPA626 (5 ピンの SOT DBV パッケージ) を削除	1
•	追加 18-bit SAR ADC to amplifier description in <i>Overview</i> section	21
•	追加 18-bit level to device description in <i>Application Information</i> section	23
•	追加 (<i>pins 3 and 4</i>) to input terminals in <i>Design Requirements</i> section of first typical application for clarity	24
•	変更 description of slew and settle time in <i>Design Requirements</i> section of second typical application for clarity	26

5 Pin Configuration and Functions

Pin Functions: OPA2626

PIN		I/O	DESCRIPTION
NAME	NO.		
+IN A	3	I	Noninverting input for channel A
-IN A	2	I	Inverting input for channel A
+IN B	5	I	Noninverting input for channel B
-IN B	6	I	Inverting input for channel B
OUT A	1	O	Output terminal for channel A
OUT B	7	O	Output terminal for channel B
V+	8	—	Positive supply voltage
V-	4	—	Negative supply voltage

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply voltage, V_S	(V+) – (V–)		6	V
Input voltage ⁽²⁾	+IN	(V–) – 0.3	(V+) + 0.3	V
	–IN	(V–) – 0.3	(V+) + 0.3	
Output voltage	OUT	(V–)	(V+)	V
Sink current	+IN		10	mA
	–IN		10	
	OUT		150	
Source current	+IN		10	mA
	–IN		10	
	OUT		150	
Temperature	Operating junction	–40	150	°C
	Operating free-air, T_A	–55	150	
	Storage, T_{stg}	–65	150	

- (1) Stresses beyond those listed under [Absolute Maximum Ratings](#) may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under [Recommended Operating Conditions](#). Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) For input voltages beyond the power-supply rails, voltage or current must be limited.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±3000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V_S	Supply input voltage, (V+) – (V–)		2.7		5.5	V
V_I	Input voltage	+IN	(V–)		(V+) – 1.15	V
		–IN	(V–)		(V+) – 1.15	
V_O	Output voltage		(V–)		(V+)	V
I_O	Output current		–120		120	mA
T_A	Operating free-air temperature		–40		125	°C
T_J	Operating junction temperature		–40		125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		OPA2626	UNIT
		DGK (VSSOP)	
		8 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	171.7	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	68.4	°C/W
R _{θJB}	Junction-to-board thermal resistance	91.9	°C/W
ψ _{JT}	Junction-to-top characterization parameter	9.4	°C/W
ψ _{JB}	Junction-to-board characterization parameter	90.5	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC package thermal metrics application report](#).

6.5 Electrical Characteristics: High-Supply

at T_A = 25°C, V₊ = 5 V, V_– = 0 V, V_{COM} = V_O = 2.5 V, gain (G) = 1, R_F = 1 kΩ, C_F = 2.7 pF, C_{LOAD} = 20 pF, and R_{LOAD} = 2 kΩ connected to 2.5 V (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
AC PERFORMANCE							
	Unity gain frequency	V _O = 10 mV _{PP}			80		MHz
φ _m	Phase margin				50		Degrees
GBW	Gain-bandwidth product	G = 100, V _O = 10 mV _{PP}			120		MHz
SR	Slew rate	V _O = 1-V step, G = 1			45		V/μs
		V _O = 4-V step, G = 2			115		
t _{settle}	Settling time	V _O = 4-V step, G = 2	Settling time to 0.1% (10-bit accuracy)		80		ns
			to 0.005% (14-bit accuracy)		110		
			to 0.00153% (16-bit accuracy)		280		
	Overshoot	V _O = 4-V step, G = 2			2.5%		
	Undershoot	V _O = 4-V step, G = 2			3%		
HD2	Second-order harmonic distortion	V _O = 2 V _{PP} , G = 2	f = 10 kHz		144		dBc
			f = 100 kHz		122		
			f = 1 MHz		80		
HD3	Third-order harmonic distortion	V _O = 2 V _{PP} , G = 2	f = 10 kHz		155		dBc
			f = 100 kHz		140		
			f = 1 MHz		80		
	Second-order intermodulation distortion	V _O = 2 V _{PP} , f = 1 MHz, 200-kHz tone spacing			90		dBc
	Third-order intermodulation distortion	V _O = 2 V _{PP} , f = 1 MHz, 200-kHz tone spacing			100		dBc
V _N	Input noise voltage	f = 0.1 Hz to 10 Hz, peak-to-peak			0.8		μV _{PP}
		f = 0.1 Hz to 10 Hz, rms			120		nV _{RMS}
V _n	Input voltage noise density	f = 1 kHz			3.2		nV/√Hz
		f = 10 kHz			2.5		
I _n	Input current noise density	f = 1 kHz			6.6		pA/√Hz
		f = 10 kHz			3.5		
t _{OR}	Overload recovery time	G = 5			50		ns
Z _o	Open-loop output impedance	f = 1 MHz			1		Ω
	Crosstalk	At DC			150		dB
		f = 1 MHz			127		
DC PERFORMANCE

7 Parameter Measurement Information

7.1 DC Parameter Measurements

The circuit shown in [Figure 54](#) measures the dc input offset related parameters of the OPA2626. Input offset voltage, power-supply rejection ratio, common-mode rejection ratio, and open-loop gain can be measured with this circuit. The basic test procedure requires setting the inputs (the power-supply voltage, V_S , and the common-mode voltage, V_{CM}), to the desired values. V_O is set to the desired value by adjusting the loop-drive voltage while measuring V_O . After all inputs are configured, measure the input offset at the V_X measurement point. Calculate the input offset voltage by dividing the measured result by 101. Changing the voltages on the various inputs changes the input offset voltage. The input parameters can be measured according to the relationships illustrated in [Equation 1](#) through [Equation 5](#).

Figure 54. DC-Parameters Measurement Circuit

$$V_{OS} = \frac{V_X}{101} \quad (1)$$

$$V_{OSDrift} = \frac{\Delta V_{OS}}{\Delta \text{Temperature}} \quad (2)$$

$$\text{PSRR} = \frac{\Delta V_{OS}}{\Delta V_{SUPPLY}} \quad (3)$$

$$\text{CMRR} = \frac{\Delta V_{OS}}{\Delta V_{CM}} \quad (4)$$

$$\text{AOL} = \frac{\Delta V_O}{\Delta V_{OS}} \quad (5)$$

7.2 Transient Parameter Measurements

The circuit shown in [Figure 55](#) measures the transient response of the OPA2626. Configure V_+ , V_- , R_{ISO} , R_{LOAD} , and C_{LOAD} as desired. Monitor the input and output voltages on an oscilloscope or other signal analyzer. Use this circuit to measure large-signal and small-signal transient response, slew rate, overshoot, and capacitive-load stability.

Figure 55. Pulse-Response Measurement Circuit

7.3 AC Parameter Measurements

The circuit shown in [Figure 56](#) measures the ac parameters of the OPA2626. Configure V_+ , V_- , and C_{LOAD} as desired. The [THS4271](#) family is used to buffer the input and output of the OPA2626 to prevent loading by the gain phase analyzer. Monitor the input and output voltages on a gain phase analyzer. Use this circuit to measure the gain bandwidth product, and open-loop gain versus frequency versus capacitive load.

Figure 56. AC-Parameters Measurement Circuit

7.4 Noise Parameter Measurements

The circuit shown in [Figure 57](#) measures the voltage noise of the OPA2626. Configure V+, V–, and C_{LOAD} as desired.

Figure 57. Voltage Noise Measurement Circuit

8 Detailed Description

8.1 Overview

The OPA2626 is a fast-settling, high slew rate, high-bandwidth, voltage-feedback operational amplifier. Low offset and low offset drift combine with the superior dynamic performance and low output impedance of this device, resulting in an amplifier suited for driving 16-bit and 18-bit SAR ADCs, and buffering precision voltage references in industrial applications. The OPA2626 includes low-noise input, slew boost, and rail-to-rail output stages.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 SAR ADC Driver

The OPA2626 is designed to drive precision (16-bit and 18-bit) SAR ADCs at sample rates up to 1 MSPS. The combination of low output impedance, low THD, low noise, and fast settling time make the OPA2626 the ideal choice for driving both the SAR ADC inputs, as well as the reference input to the ADC. Internal slew boost circuitry increases the slew rate as a function of the input signal magnitude, resulting in settling from a 4-V step input to 16-bit levels within 280 ns. Low output impedance ($1\ \Omega$ at 1 MHz) ensures capacitive load stability with minimal overshoot.

8.3.2 Electrical Overstress

Designers often ask questions about the capability of an operational amplifier to withstand electrical overstress (EOS). These questions tend to focus on the device inputs, but may involve the supply voltage pins or even the output pin. Each of these different pin functions have electrical stress limits determined by the voltage breakdown characteristics of the particular semiconductor fabrication process and specific circuits connected to the pin. Additionally, internal electrostatic discharge (ESD) protection is built into these circuits to protect them from accidental ESD events both before and during product assembly. A good understanding of this basic ESD circuitry and how the ESD circuitry relates to an electrical overstress event is helpful. [Figure 60](#) provides a diagram of the ESD circuits contained in the OPA2626. The ESD protection circuitry involves several current-steering diodes connected from the input and output pins and routed back to the internal power-supply lines, where the diodes meet at an absorption device or the power-supply ESD cell, internal to the operational amplifier. This protection circuitry is intended to remain inactive during normal circuit operation.

Figure 60. Simplified ESD Circuit

8.4 Device Functional Modes

The OPA2626 has a single functional mode and is operational when the power supply voltage, V_S , is between 2.7 V (± 1.35 V) and 5.5 V (± 2.75 V).

8.4.1 High-Drive Mode

The OPA2626 has a 120-MHz gain bandwidth, 2.5-nV/ $\sqrt{\text{Hz}}$ input-referred noise, and consumes 2 mA of quiescent current. Additionally, the OPA2626 has an offset voltage of 100 μV (maximum) and an offset voltage drift of 1 $\mu\text{V}/^\circ\text{C}$ (typical). This combination of high precision, high speed, and low noise makes this device suitable for use as an input driver for high-precision, high-throughput SAR ADCs such as the [ADS88xx](#) family of SAR ADCs, as illustrated in [Figure 61](#).

9 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The OPA2626 consists of precision, high-speed, voltage-feedback operational amplifiers. Fast settling to 16-bit and 18-bit levels, low THD, and low noise make the OPA2626 suitable for driving SAR ADC inputs and buffering precision voltage references. With a wide power-supply voltage range from 2.7 V to 5.5 V, and operating from -40°C to $+125^\circ\text{C}$, the OPA2626 is suitable for a variety of high-speed, industrial applications. The following sections show application information for the OPA2626. For simplicity, power-supply decoupling capacitors are not shown in these diagrams.

9.2 Typical Applications

9.2.1 Single-Supply, 16-Bit, 1-MSPS SAR ADC Driver

Figure 61. Single-Supply, 16-Bit, 1-MSPS SAR ADC Driver

Typical Applications (continued)

9.2.1.1 Design Requirements

A SAR ADC, such as the [ADS8860](#) device, uses sampling capacitors on the data converter input. During the signal acquisition phase, these sampling capacitors are connected to the ADC analog input terminals AINP and AINN (pins 3 and 4), through a set of switches. After the acquisition period has elapsed, the internal sampling capacitors are disconnected from the input terminals (pins 3 and 4) and connected to the ADC input through a second set of switches, during this period the ADC is performing the analog-to-digital conversion. [Figure 62](#) shows this architecture.

Figure 62. Simplified SAR ADC Input

The SAR ADC inputs and sampling capacitors must be driven by the OPA2626 to 16-bit levels within the acquisition time of the ADC. For the example illustrated in [Figure 61](#), the OPA2626 is used to drive the ADS8860 at a sample rate of 1 MSPS.

9.2.1.2 Detailed Design Procedure

The circuit illustrated in [Figure 61](#) consists of the SAR ADC driver, a low-pass filter, and the SAR ADC. The SAR ADC driver circuit consists of an OPA2626 configured in an inverting gain of 1. The filter consists of R_{FLT} and C_{FLT} , connected between the OPA2626 output and the ADS8860 input. Selecting the proper values for each of these passive components is critical to obtain the best performance from the ADC. Capacitor C_{FLT} serves as a charge reservoir, providing the necessary charge to the ADC sampling capacitors. The dynamic load presented by the ADC creates a glitch on the filter capacitor, C_{FLT} . To minimize the magnitude of this glitch, choose a value for C_{FLT} large enough to maintain a glitch amplitude of less than 100 mV. Maintaining such a low glitch amplitude at the amplifier output makes sure that the amplifier remains in the linear operating region, and results in a minimum settling time. Using [Equation 6](#), a 10-nF capacitor is selected for C_{FLT} .

$$C_{FLT} \geq 15 \times C_{SH} \quad (6)$$

Connecting a 10-nF capacitor directly to the OPA2626 output degrades the OPA2626 phase margin and results in stability and settling-time problems. To properly drive the 10-nF capacitor, use a series resistor (R_{FLT}) to isolate the capacitor, C_{FLT} , from the OPA2626. R_{FLT} must be sized based upon several constraints. To determine a suitable value for R_{FLT} , consider the impact upon the THD resulting from the voltage divider effect from R_{FLT} reacting with the switch resistance (R_{SW}) of the ADC input circuit, as well as the impact of the output impedance upon amplifier stability. In this example, 4.7- Ω resistors are selected. In this design example, [Equation 13](#) can be used to estimate a suitable value for R_{ISO} . R_{ISO} represents the total resistance in series with C_{FLT} , and in this example is equivalent to $2 \times R_{FLT}$.

For step-by-step design procedure, circuit schematics, bill of materials, printed circuit board (PCB) files, simulation results, and test results, refer to the [Power-optimized 16-bit 1MSPS Data Acquisition Block for Lowest Distortion and Noise Reference Design reference guide](#).

9.2.1.3 Application Curve

Figure 63 shows the performance of the circuit in Figure 61.

4096-point FFT at 1 MSPS, $f_{IN} = 10 \text{ kHz}$, $V_{IN} = 1.5 V_{RMS}$

Figure 63. ADC Output FFT for Figure 61

9.2.2 Single-Supply, 16-Bit, 1-MSPS, Multiplexed, SAR ADC Driver

In order to operate a high-resolution, 16-bit ADC at its maximum throughput, the full-scale voltage step must settle to better than 16-bit accuracy at the ADC inputs within the minimum specified acquisition time (t_{ACQ}). This settling imposes very stringent requirements on the driver amplifier in terms of large-signal bandwidth, slew rate, and settling time. [Figure 64](#) shows a typical multiplexed ADC driver application using the OPA2626.

Figure 64. Single-Supply, 16-Bit, 1-MSPS, Multiplexed, SAR ADC Driver

9.2.2.1 Design Requirements

To optimize this circuit for performance, this design does not allow any large signal input transients at the driver circuit inputs for a small quiet-time period (t_{QT}) towards the end of the previous conversion. The input step voltage can appear anytime from the beginning of conversion (CONVST rising edge) until the elapse of a half cycle time ($0.5 \times t_{CYC}$). This timing constraint on the input step allows a minimum settling time of ($t_{QT} + t_{ACQ}$) for the ADC input to settle within the required accuracy, in the worst-case scenario. $t_{QT} + t_{ACQ}$ is the total time in which the output of the amplifier has to slew and settle within the required accuracy before the next conversion starts. [Figure 65](#) shows this timing sequence.

Figure 65. Timing Diagram for Input Signals

9.2.2.2 Detailed Design Procedure

An ADC input driver circuit consists of two parts: a driving amplifier and a fly-wheel RC filter. The amplifier is used for signal conditioning of the input voltage and the low output impedance provides a buffer between the signal source and the ADC input. The RC filter helps attenuate the sampling charge-injection from the switched-capacitor input stage of the ADC and acts as an antialiasing filter to band-limit the wideband noise contributed by the front-end circuit. The design of the ADC input driver involves optimizing the bandwidth of the circuit, driven by the following requirements:

- The R_{FLT} and C_{FLT} filter bandwidth must be low to band-limit the noise fed into the input of the ADC, thereby increasing the signal-to-noise ratio (SNR) of the system
- The overall system bandwidth must be large enough to accommodate optimal settling of the input signal at the ADC input before the conversion starts

C_{FLT} is chosen based upon 式 7. C_{FLT} is chosen to be 1 nF.

$$C_{FLT} \geq 15 \times C_{SH} \quad (7)$$

Connecting a 1-nF capacitor directly to the output of the OPA2626 degrades the OPA2626 phase margin and results in stability and settling time problems. To properly drive the 1-nF capacitor, a series resistor, R_{FLT} , is used to isolate the capacitor, C_{FLT} , from the OPA2626. R_{FLT} must be sized based upon several constraints. To determine a suitable value for R_{FLT} , the system designer must consider the impact upon the THD resulting from the voltage divider effect from R_{FLT} reacting with the switch resistance, R_{SW} , of the ADC input circuit as well as the impact of the output impedance upon amplifier stability. In this example 12.4-Ω resistors are selected. In this design example, 図 12 can be used to estimate a suitable value for R_{ISO} . R_{ISO} represents the total resistance in series with C_{FLT} , which in this example is equivalent to $2 \times R_{FLT}$.

For step-by-step design procedure, circuit schematics, bill of materials, printed circuit board (PCB) files, simulation results, and test results, refer to the [18-Bit Data Acquisition \(DAQ\) Block Optimized for 1-μs Full-Scale Step Response](#) reference guide.

10 Power Supply Recommendations

The OPA2626 is specified for operation from 2.7 V to 5.5 V (± 1.35 V to ± 2.75 V); many specifications apply from -40°C to $+125^{\circ}\text{C}$. Parameters that can exhibit significant variance with regard to operating voltage or temperature are presented in the [Typical Characteristics](#) section. Place bypass capacitors close to the power-supply pins to reduce errors coupling in from noisy or high-impedance power supplies. For more detailed information on bypass capacitor placement, see the [Layout](#) section.

注意

Supply voltages larger than 6 V can cause permanent damage to the device. See the [Absolute Maximum Ratings](#) section.

11 Layout

11.1 Layout Guidelines

For best operational performance of the device, use good PCB layout practices, including:

- Use bypass capacitors to reduce the noise coupled from the power supply. Connect low ESR, ceramic, bypass capacitors between the power-supply pins (V+ and V-) and the ground plane. Place the bypass capacitors as close to the device as possible with the 100-nF capacitor closest to the device, as indicated in [Figure 68](#). For single-supply applications, bypass capacitors on the V- pin are not required.
- Separate grounding for analog and digital portions of the circuitry is one of the simplest and most-effective methods of noise suppression. One or more layers on multilayer PCBs are usually devoted to ground planes. A ground plane helps distribute heat and reduces electromagnetic interference (EMI) noise pickup. Make sure to physically separate digital and analog grounds paying attention to the flow of the ground current. (For more details, see the [Circuit Board Layout Techniques chapter extract](#).)
- In order to reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If the traces cannot be kept separate, crossing the sensitive trace perpendicular is better as opposed to in parallel with the noisy trace.
- Minimize parasitic coupling between +IN and OUT for best ac performance.
- Place the external components as close to the device as possible. As illustrated in [Figure 68](#), keeping RF, CF, and RG close to the inverting input minimizes parasitic capacitance.
- Keep the length of input traces as short as possible. Always remember that the input traces are the most sensitive part of the circuit.
- Cleaning the PCB following board assembly is recommended for best performance.
- Any precision integrated circuit can experience performance shifts resulting from moisture ingress into the plastic package. Following any aqueous PCB cleaning process, bake the PCB assembly to remove moisture introduced into the device packaging during the cleaning process. A low-temperature, post-cleaning bake at 85°C for 30 minutes is sufficient for most circumstances.

OPA2626IDGKT	ACTIVE	VSSOP	DGK	8	250	RoHS & Green	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	16R6	Samples

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

- ☒ C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.
- ☐ D. Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
- E. Falls within JEDEC MO-187 variation AA, except interlead flash.

DGK (S-PDSO-G8)

PLASTIC SMALL OUTLINE PACKAGE

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

重要なお知らせと免責事項

TI は、技術データと信頼性データ(データシートを含みます)、設計リソース(リファレンス・デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、TI 製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した TI 製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションが適用される各種規格や、その他のあらゆる安全性、セキュリティ、またはその他の要件を満たしていることを確実にする責任を、お客様のみが単独で負うものとします。上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている TI 製品を使用するアプリケーションの開発の目的でのみ、TI はその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。TI や第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、TI およびその代理人を完全に補償するものとし、TI は一切の責任を拒否します。
