

TPS53311 3A スイッチャ内蔵降圧型レギュレータ

1 特長

- 最高95.5%の効率
- 3Aの連続出力電流
- すべてのMLCC出力コンデンサをサポート
- SmoothPWM™自動スキップ Eco-mode™によって軽負荷時の効率を向上
- 電圧モード制御
- マスタ/スレーブのインターリーブ動作をサポート
- 公称周波数の±20%まで同期
- 2.9V～6Vの電圧変換範囲
- ディセーブル時のソフトストップ出力放電
- 可変出力電圧範囲:
0.6V～0.84V×V_{IN}
- 過電流、過電圧、過熱保護
- 小型の3mm×3mm、16ピンVQFNパッケージ
- オープン・ドレインのパワー・グッド・インジケータ
- 内部ブートストラップ・スイッチ
- 低いR_{DS(on)}、3.3V入力で24mΩ、5V入力で19mΩ
- プリバイアス・スタートアップ機能をサポート

2 アプリケーション

- 5V降圧レール
- 3.3V降圧レール

3 概要

TPS53311を使用すると、完全に統合された3V～5V V_{IN}の統合同期FETコンバータ・ソリューションを実現でき、200mm²のPCB領域に合計16個の部品を搭載できます。低いR_{DS(on)}とTI独自のSmoothPWM™スキップ・モード動作により、95.5%のピーク効率、100mAの軽負荷で90%超の効率が得られます。22μFセラミック出力コンデンサを2つ使用するだけで、電力密度の高い3Aソリューションを構築できます。

TPS53311は、1.1MHzのスイッチング周波数、SKIPモード動作のサポート、プリバイアスのスタートアップ、内部ソフトスタート、出力ソフト放電、内部VBSTスイッチ、パワー・グッド、EN/入力UVLO、過電流、過電圧、低電圧、過熱保護の機能があり、すべてのセラミック出力コンデンサをサポートしています。2.9V～3.5Vの電源電圧と、2.9V～6Vの変換電圧に対応し、出力電圧は0.6V～0.84V×V_{IN}の範囲で調整可能です。

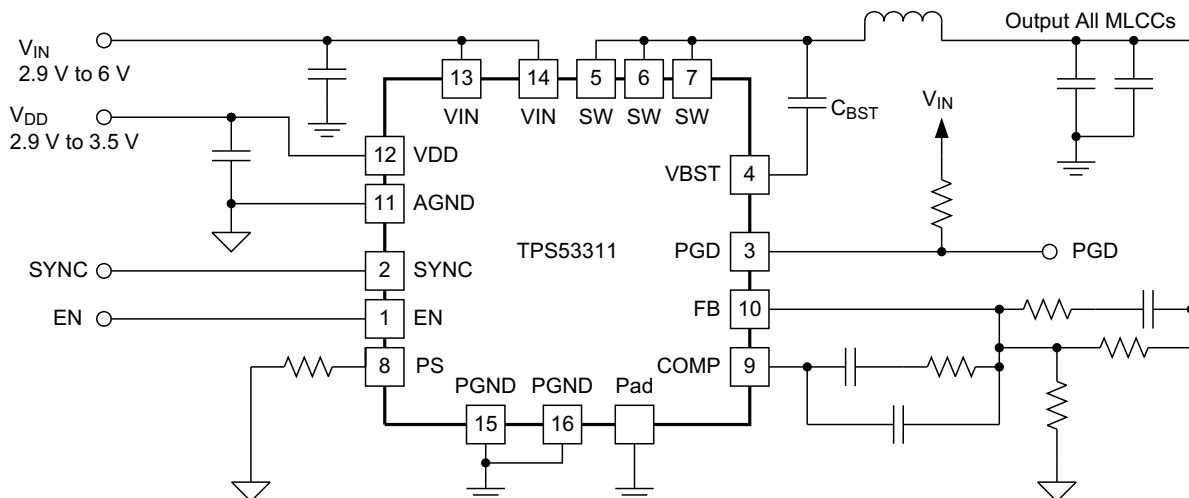

TPS53311は3mm×3mmの16ピンVQFNパッケージ (Green RoHs準拠、鉛フリー)で供給され、-40℃～85℃で動作します。

5 Pin Configuration and Functions

Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NO.	NAME		
1	EN	I	Enable. Internally pulled up to VDD with a 1.35-MΩ resistor.
2	SYNC	B	Synchronization signal for input interleaving. Master SYNC pin sends out 180° out-of-phase signal to slave SYNC. SYNC frequency must be within ±20% of slave nominal frequency.
3	PGD	O	Power good output flag. Open drain output. Pull up to an external rail through a resistor.
4	VBST	P	Supply input for high-side MOSFET (bootstrap terminal). Connect capacitor from this pin to SW terminal.
5	SW	B	Output inductor connection to integrated power devices.
6	SW	B	Output inductor connection to integrated power devices.
7	SW	B	Output inductor connection to integrated power devices.
8	PS	I	Mode configuration pin (with 10 μA current): Connecting to ground: Forced CCM slave. Pulled high or floating (internal pulled high): Forced CCM master. Connect with 24.3 kΩ to GND: DE slave. Connect with 57.6 kΩ to GND: HEF mode. Connect with 105 kΩ to GND: reserved mode. Connect with 174 kΩ to GND: DE master.
9	COMP	O	Error amplifier compensation terminal. Type III compensation method is recommended for stability.
10	FB	I	Voltage feedback. Also used for OVP, UVP, and PGD determination.
11	AGND	G	Device analog ground terminal.
12	VDD	P	Input bias supply for analog functions.
13	VIN	P	Gate driver supply and power conversion voltage.
14	VIN	P	Gate driver supply and power conversion voltage.
15	PGND	P	IC power GND terminal.
16	PGND	P	IC power GND terminal.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

			MIN	MAX	UNIT
Input voltage	VIN, EN		−0.3	7	V
	VBST		−0.3	17	
	VBST(with respect to SW)		−0.3	7	
	FB, PS, VDD		−0.3	3.7	
Output voltage	SW	DC	−1	7	V
		Pulse < 20 ns, E = 5 μJ	−3	10	
	PGD		−0.3	7	
	COMP, SYNC		−0.3	3.7	
	PGND		−0.3	0.3	
Operating temperature, T _A			−40	85	°C
Junction temperature, T _J			−40	150	°C
Storage temperature, T _{stg}			−55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾		±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾		±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT

7 Detailed Description

7.1 Overview

The TPS53311 is a high-efficiency switching regulator with two integrated N-channel MOSFETs and is capable of delivering up to 3 A of load current. The TPS53311 provides output voltage between 0.6 V and $0.84 \times V_{IN}$ from 2.9-V to 6-V wide input voltage range.

This device employs five operation modes to fit various application requirements. The *master and slave* mode enables a two-phase interleaved operation to reduce input ripple. The *skip* mode operation provides reduced power loss and increases the efficiency at light load. The unique, patented PWM modulator enables smooth light load to heavy load transition while maintaining fast load transient.

7.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

7.3 Feature Description

7.3.1 Soft Start

The soft-start function reduces the inrush current during the start-up sequence. A slow-rising reference voltage is generated by the soft-start circuitry and sent to the input of the error amplifier. When the soft-start ramp voltage is less than 600 mV, the error amplifier uses this ramp voltage as the reference. When the ramp voltage reaches 600 mV, the error amplifier switches to a fixed 600-mV reference. The typical soft-start time is 400 μ s.

Feature Description (continued)

7.3.2 Power Good

The TPS53311 monitors the voltage on the FB pin. If the FB voltage is between 83% and 117% of the reference voltage, the power good signal remains high. If the FB voltage falls outside of these limits, the internal open-drain output pulls the power good pin (PGD) low.

During start-up, the input voltage must be higher than 1 V to have valid power good logic, and the power good signal is delayed for 400 μ s after the FB voltage falls to within the power good limits. There is also 10- μ s delay during the shutdown sequence.

7.3.3 Undervoltage Lockout (UVLO) Function

The TPS53311 provides undervoltage lockout (UVLO) protection for both power input (V_{IN}) and bias input (V_{DD}) voltage. If either of them is lower than the UVLO threshold voltage minus the hysteresis, the device shuts off. When the voltage rises above the threshold voltage, the device restarts. The typical UVLO rising threshold is 2.8 V for both V_{IN} and V_{DD} . A hysteresis voltage of 130 mV for V_{IN} and 75 mV for V_{DD} is also provided to prevent glitch.

7.3.4 Overcurrent Protection

The TPS53311 continuously monitors the current flowing through the high-side and the low-side MOSFETs. If the current through the high-side FET exceeds 4.5 A, the high-side FET turns off and the low-side FET turns on until the next PWM cycle. An overcurrent (OC) counter starts to increment each occurrence of an overcurrent event. The converter shuts down immediately when the OC counter reaches four. The OC counter resets if the detected current is less 4.5 A after an OC event.

Another set of overcurrent circuitry monitors the current flowing through low-side FET. If the current through the low-side FET exceeds 5.1 A, the overcurrent protection is enabled and immediately turns off both the high-side and the low-side FETs and shuts down the converter. The device is fully protected against overcurrent during both on-time and off-time. This protection is latched. See TPS53310 data sheet, [3-A Step-Down Regulator with Integrated Switcher](#) (SLUSA68), for information on hiccup overcurrent protection.

7.3.5 Overvoltage Protection

The TPS53311 monitors the voltage divided feedback voltage to detect overvoltage and undervoltage conditions. When the feedback voltage is greater than 117% of the reference, the high-side MOSFET turns off and the low-side MOSFET turns on. The output voltage then drops until it reaches the undervoltage threshold. At that point the low-side MOSFET turns off and the device enters a high-impedance state.

7.3.6 Undervoltage Protection

When the feedback voltage is lower than 83% of the reference voltage, the undervoltage protection timer starts. If the feedback voltage remains lower than the undervoltage threshold voltage after 10 μ s, the device turns off both the high-side and the low-side MOSFETs and goes into a high-impedance state. This protection is latched.

7.3.7 Overtemperature Protection

The TPS53311 continuously monitors the die temperature. If the die temperature exceeds the threshold value (140°C typical), the device shuts off. When the device temperature falls to 40°C below the overtemperature threshold, it restarts and returns to normal operation.

7.3.8 Output Discharge

When the enable pin is low, the TPS53311 discharges the output capacitors through an internal MOSFET switch between SW and PGND while high-side and low-side MOSFETs remain off. The typical discharge switch-on resistance is 60 Ω . This function is disabled when V_{IN} is less than 1 V.

Feature Description (continued)

7.3.9 Master and Slave Operation and Synchronization

Two TPS53311 can operate interleaved when configured as master and slave. The SYNC pins of the two devices are connected together for synchronization. In CCM, the master device sends the 180° out-of-phase pulse to the slave device through the SYNC pin, which determines the leading edge of the PWM pulse. If the slave device does not receive the SYNC pulse from the master device or if the SYNC connection is broken during operation, the slave device continues to operate using its own internal clock.

In DE mode, the master and slave switching node does not synchronize to each other if either one of them is operating in DCM. When both master and slave enters CCM, the switching nodes of master and slave synchronize to each other.

The SYNC pin of the slave device can also connect to external clock source within $\pm 20\%$ of the 1.1-MHz switching frequency. The falling edge of the SYNC triggers the rising edge of the PWM signal.

7.4 Device Functional Modes

7.4.1 Operation Mode

The TPS53311 offers five operation modes determined by the PS pin connections listed in [Table 1](#).

Table 1. Operation Mode Selection

PS PIN CONNECTION	OPERATION MODE	AUTO-SKIP AT LIGHT LOAD	MASTER AND SLAVE SUPPORT
GND	FCCM Slave	—	Slave
24.3 k Ω to GND	DE Slave	Yes	Slave
57.6 k Ω to GND	HEF Mode	Yes	—
174 k Ω to GND	DE Master	Yes	Master
Floating or pulled to VDD	FCCM Master	—	Master

In *forced continuous conduction mode* (FCCM), the high-side FET is ON during the on-time and the low-side FET is ON during the off-time. The switching is synchronized to the internal clock thus the switching frequency is fixed.

In *diode emulation* mode (DE), the high-side FET is ON during the on-time and low-side FET is ON during the off-time until the inductor current reaches zero. An internal zero-crossing comparator detects the zero crossing of inductor current from positive to negative. When the inductor current reaches zero, the comparator sends a signal to the logic control and turns off the low-side FET.

When the load is increased, the inductor current is always positive and the zero-crossing comparator does not send a zero-crossing signal. The converter enters into *continuous conduction mode* (CCM) when no zero-crossing is detected for two consecutive PWM pulses. The switching synchronizes to the internal clock and the switching frequency is fixed.

In *high-efficiency* mode (HEF), the operation is the same as diode emulation mode at light load. However, the converter does not synchronize to the internal clock during CCM. Instead, the PWM modulator determines the switching frequency.

7.4.2 Light Load Operation

In skip modes (DE and HEF) when the load current is less than one-half of the inductor peak current, the inductor current becomes negative by the end of off-time. During light load operation, the low-side MOSFET is turned off when the inductor current reaches zero. The energy delivered to the load per switching cycle is increased compared to the normal PWM mode operation and the switching frequency is reduced. The switching loss is reduced, thereby improving efficiency.

In both DE and HEF mode, the switching frequency is reduced in discontinuous conduction mode (DCM). When the load current is 0 A, the minimum switching frequency is reached. The difference between V_{VBST} and V_{SW} must be maintained at a value higher than 2.4 V.

7.4.3 Forced Continuous Conduction Mode

When the PS pin is grounded or greater than 2.2 V, the TPS53311 is operating in *forced continuous conduction mode* in both light-load and heavy-load conditions. In this mode, the switching frequency remains constant over the entire load range, making it suitable for applications that need tight control of switching frequency at a cost of lower efficiency at light load.

8 Application and Implementation

NOTE

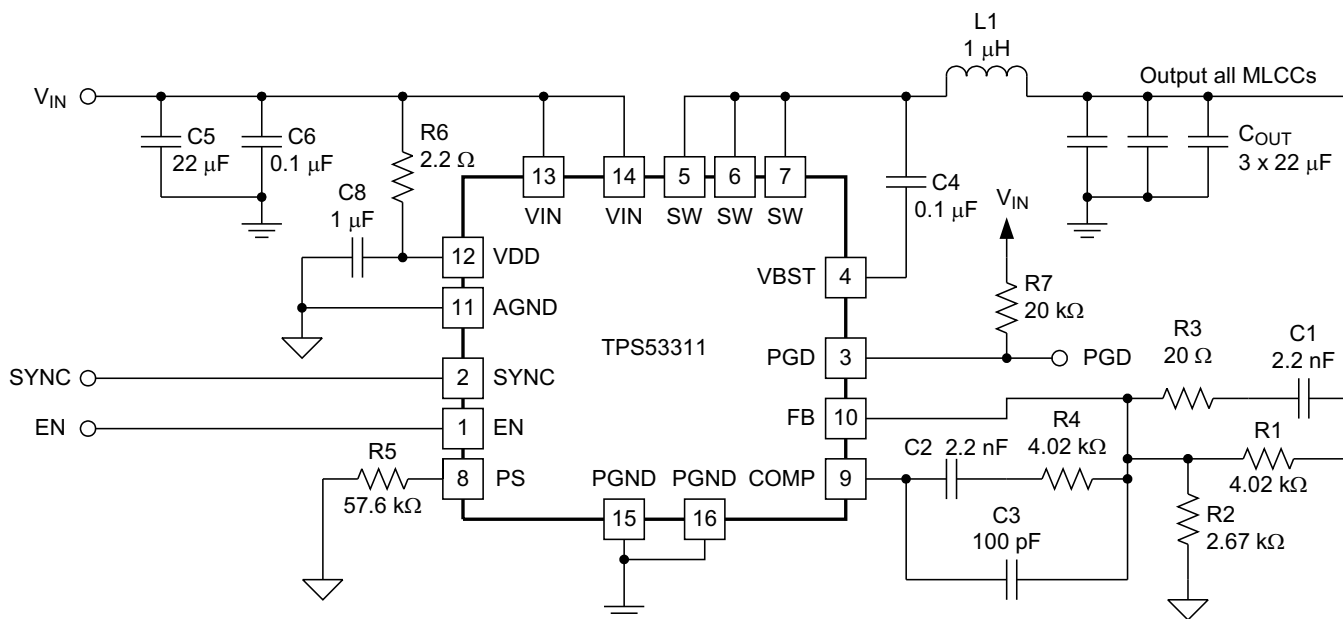

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The TPS53311 device is a high-efficiency synchronous-buck converter. The device suits low-output voltage point-of-load applications with 3-A or lower output current in computing and similar digital consumer applications.

8.2 Typical Application

This design example describes a voltage-mode, 3-A synchronous buck converter with integrated MOSFETs. The TPS53311 device provides a fixed 1.5-V output at up to 3 A from a 3.3-V input bus.

Copyright © 2016, Texas Instruments Incorporated

Figure 13. Typical 3.3-V Input Application Circuit Diagram

8.2.1 Design Requirements

Table 2 lists the parameters for this design example.

Table 2. TPS53311 Design Example Specifications

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
INPUT CHARACTERISTICS					
Input voltage, V_{IN}	V_{IN}	2.9	3.3	6	V
Maximum input current	$V_{IN} = 3.3\text{ V}, 1.5\text{ V or }3\text{ A}$			2.82	A
No load input current	$V_{IN} = 3.3\text{ V}, 1.5\text{ V or }0\text{ A}$			40	mA
OUTPUT CHARACTERISTICS					
Output voltage, V_O		1.485	1.5	1.515	V
Output voltage regulation	Line regulation		0.1%		
	Load regulation		1%		

Typical Application (continued)

Table 2. TPS53311 Design Example Specifications (continued)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Output voltage ripple	$V_{IN} = 3.3\text{ V}, 1.5\text{ V}$ or 0 A to 3 A			20	mVpp
Output load current		0		3	A
Output over current			4.5		A
SYSTEMS CHARACTERISTICS					
Switching frequency	Fixed		1.1		MHz
1.5-V full load efficiency	$V_{IN} = 3.3\text{ V}, 1.5\text{ V}$ or 3 A		88.82%		
	$V_{IN} = 5\text{ V}, 1.5\text{ V}$ or 3 A		89.5%		
Operating temperature			25		°C

8.2.2 Detailed Design Procedure

Select the external components using the following steps.

8.2.2.1 Determine the Value of R1 and R2

The output voltage is programmed by the voltage-divider resistor, R1 and R2 shown in [Figure 13](#). R1 is connected between the FB pin and the output, and R2 is connected between the FB pin and GND. The recommended value for R1 is from 1 kΩ to 5 kΩ. Determine R2 using equation in [Equation 1](#).

$$R2 = \frac{0.6}{V_{OUT} - 0.6} \times R1 \quad (1)$$

8.2.2.2 Choose the Inductor

The inductance value must be determined to give the ripple current of approximately 20% to 40% of maximum output current. The inductor ripple current is determined by [Equation 2](#).

$$I_{L(\text{ripple})} = \frac{1}{L \times f_{SW}} \times \frac{(V_{IN} - V_{OUT}) \times V_{OUT}}{V_{IN}} \quad (2)$$

The inductor also needs to have low DCR to achieve good efficiency, as well as enough room above peak inductor current before saturation.

8.2.2.3 Choose the Output Capacitor(s)

The output capacitor selection is determined by output ripple and transient requirement. When operating in CCM, the output ripple has three components calculated with [Equation 3](#) through [Equation 6](#).

$$V_{RIPPLE} = V_{RIPPLE(C)} + V_{RIPPLE(ESR)} + V_{RIPPLE(ESL)} \quad (3)$$

$$V_{RIPPLE(C)} = \frac{I_{L(\text{ripple})}}{8 \times C_{OUT} \times f_{SW}} \quad (4)$$

$$V_{RIPPLE(ESR)} = I_{L(\text{ripple})} \times ESR \quad (5)$$

$$V_{RIPPLE(ESL)} = \frac{V_{IN} \times ESL}{L} \quad (6)$$

When ceramic output capacitors are used, the ESL component is usually negligible. In the case when multiple output capacitors are used, ESR and ESL must be the equivalent of ESR and ESL of all the output capacitor in parallel.

When operating in DCM, the output ripple is dominated by the component determined by capacitance. It also varies with load current and can be expressed as shown in [Equation 7](#).

$$V_{\text{RIPPLE(DCM)}} = \frac{(\alpha \times I_{L(\text{ripple})} - I_{\text{OUT}})^2}{2 \times C_{\text{OUT}} \times f_{\text{SW}} \times I_{L(\text{ripple})}}$$

where

- α is the DCM on-time coefficient and can be expressed in Equation 8 (typical value 1.25) (7)

$$\alpha = \frac{t_{\text{ON(DCM)}}}{t_{\text{ON(CCM)}}} \quad (8)$$

Figure 14. DCM V_{OUT} Ripple Calculation

8.2.2.4 Choose the Input Capacitor

The selection of input capacitor must be determined by the ripple current requirement. The ripple current generated by the converter needs to be absorbed by the input capacitors as well as the input source. The RMS ripple current from the converter can be expressed in Equation 9.

$$I_{\text{IN(ripple)}} = I_{\text{OUT}} \times \sqrt{D \times (1-D)}$$

where

- D is the duty cycle and can be expressed as shown in Equation 10 (9)

$$D = \frac{V_{\text{OUT}}}{V_{\text{IN}}} \quad (10)$$

To minimize the ripple current drawn from the input source, sufficient input decoupling capacitors must be placed close to the device. TI recommends the ceramic capacitor because it provides low ESR and low ESL. The input voltage ripple can be calculated as shown in Equation 11 when the total input capacitance is determined.

$$V_{\text{IN(ripple)}} = \frac{I_{\text{OUT}} \times D}{f_{\text{SW}} \times C_{\text{IN}}} \quad (11)$$

8.2.2.5 Compensation Design

The TPS53311 uses voltage mode control. To effectively compensate the power stage and ensure fast transient response, Type III compensation is typically used.

The control to output transfer function can be described in Equation 12.

$$G_{CO} = 4 \times \frac{1 + s \times C_{OUT} \times ESR}{1 + s \times \left(\frac{L}{DCR + R_{LOAD}} + C_{OUT} \times (ESR + DCR) \right) + s^2 \times L \times C_{OUT}} \quad (12)$$

The output L-C filter introduces a double pole which can be calculated as shown in Equation 13.

$$f_{DP} = \frac{1}{2 \times \pi \times \sqrt{L \times C_{OUT}}} \quad (13)$$

The ESR zero can be calculated as shown in Equation 14.

$$f_{ESR} = \frac{1}{2 \times \pi \times ESR \times C_{OUT}} \quad (14)$$

Figure 15 and Figure 16 show the configuration of Type III compensation and typical pole and zero locations. Equation 16 through Equation 20 describe the compensator transfer function and poles and zeros of the Type III network.

UGD-10058

UDG-10057

Figure 15. Type III Compensation Network Configuration Schematic

Figure 16. Type III Compensation Gain Plot and Zero/Pole Placement

$$G_{EA} = \frac{(1 + s \times C_1 \times (R_1 + R_3))(1 + s \times R_4 \times C_2)}{(s \times R_1 \times (C_2 + C_3)) \times (1 + s \times C_1 \times R_3) \times \left(1 + s \times R_4 \times \frac{C_2 \times C_3}{C_2 + C_3} \right)} \quad (15)$$

$$f_{Z1} = \frac{1}{2 \times \pi \times R_4 \times C_2} \quad (16)$$

$$f_{Z2} = \frac{1}{2 \times \pi \times (R_1 + R_3) \times C_1} \cong \frac{1}{2 \times \pi \times R_1 \times C_1} \quad (17)$$

$$f_{P1} = 0 \quad (18)$$

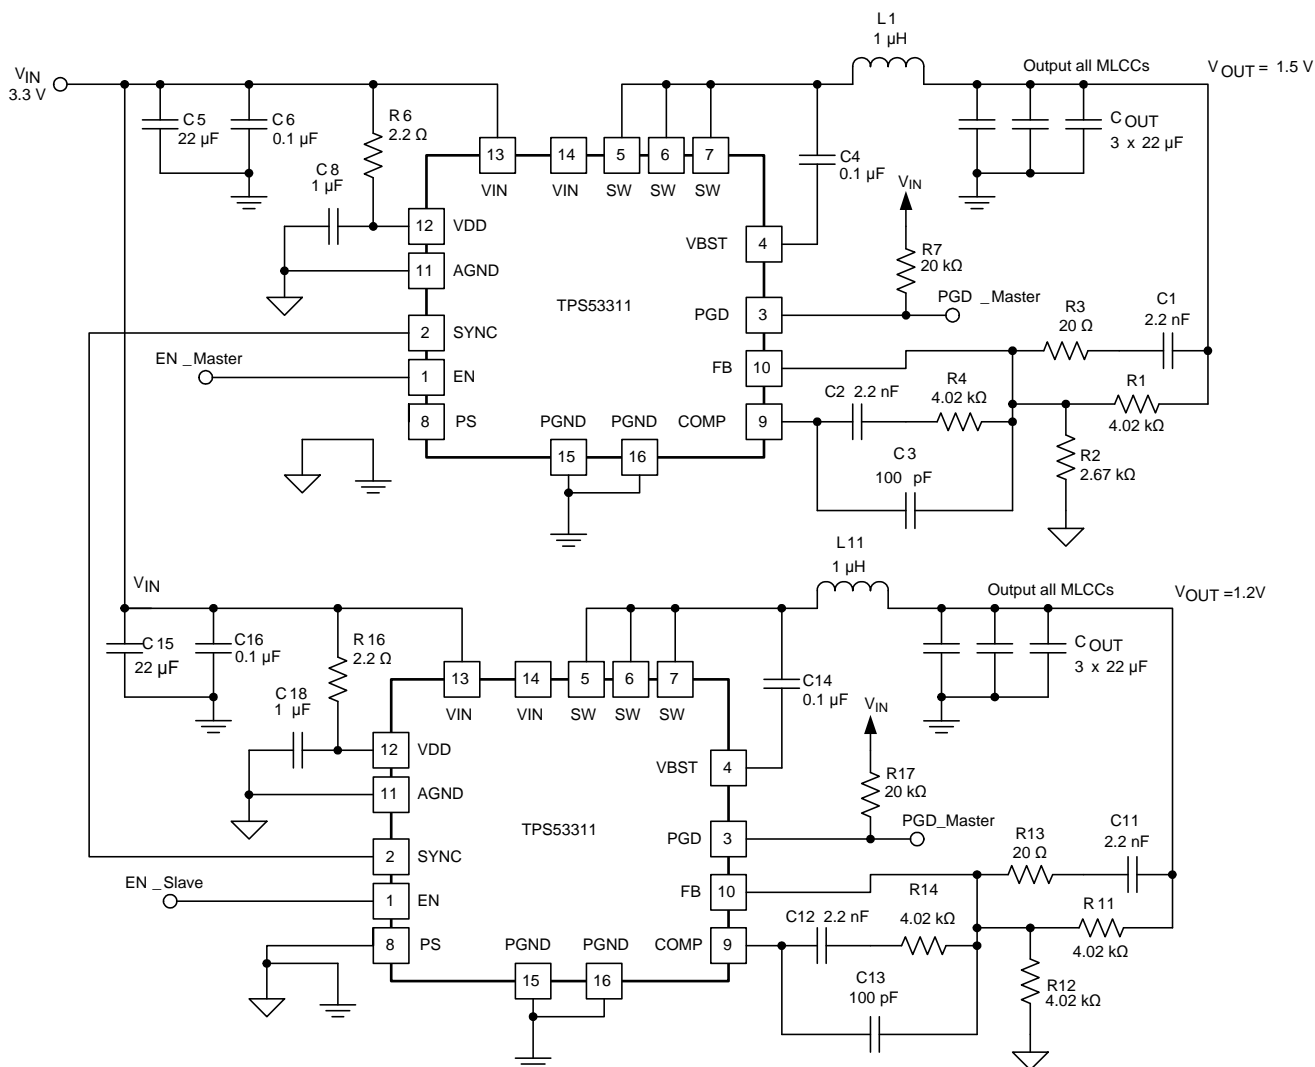

$$f_{P2} = \frac{1}{2 \times \pi \times R_3 \times C_1} \quad (19)$$

$$f_{P3} = \frac{1}{2 \times \pi \times R_4 \times \left(\frac{C_2 \times C_3}{C_2 + C_3} \right)} \cong \frac{1}{2 \times \pi \times R_4 \times C_3} \quad (20)$$

The two zeros can be placed near the double pole frequency to cancel the response from the double pole. One pole can be used to cancel ESR zero, and the other non-zero pole can be placed at half switching frequency to attenuate the high frequency noise and switching ripple. Suitable values can be selected to achieve a compromise between high phase margin and fast response. A phase margin higher than 45 degrees is required for stable operation.

For DCM operation, a C3 between 56 pF and 150 pF is recommended for output capacitance between 20 μ F to 200 μ F.

9 Power Supply Recommendations

The TPS53311 device is designed to operate from an input voltage supply range from 2.9 V to 6 V (2.9 V to 3.5 V biased). This input supply must be well regulated. Proper bypassing of input supplies and internal regulators is also critical for noise performance, as is PCB layout and grounding scheme. See the recommendations in [Layout](#).

10 Layout

10.1 Layout Guidelines

Good layout is essential for stable power supply operation. Follow these guidelines for a clean PCB layout:

- Separate the power ground and analog ground planes. Connect them together at one location.
- Use four vias to connect the thermal pad to power ground.
- Place V_{IN} and V_{DD} decoupling capacitors as close to the device as possible.
- Use wide traces for V_{IN} , V_{OUT} , PGND and SW. These nodes carry high current and also serve as heat sinks.
- Place feedback and compensation components as close to the device as possible.
- Keep analog signals (FB, COMP) away from noisy signals (SW, SYNC, VBST).
- See [Using the TPS53311EVM-561, a 3-A Eco-mode™ Integrated Switcher With Master Slave](#) (SLUU428) for a layout example.

10.2 Layout Example

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS53311RGTR	ACTIVE	VQFN	RGT	16	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	3311	Samples
TPS53311RGTT	ACTIVE	VQFN	RGT	16	250	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	3311	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

RGT (S-PVQFN-N16)

PLASTIC QUAD FLATPACK NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.
