About This Manual

Describes the operation of the software-programmable 64-bit timer in the TMS320DM644x Digital Media System-on-Chip (DMSoC). Timer 0 and Timer 1 (controlled by the ARM or the DSP) are used as general-purpose (GP) timers and can be programmed in 64-bit mode, dual 32-bit unchained mode, or dual 32-bit chained mode; Timer 2 (controller by the ARM only) is used only as a watchdog timer. The GP timer modes can be used to generate periodic interrupts or enhanced direct access (EDMA) synchronization events. The watchdog timer mode is used to provide a recovery mechanism for the device in the event of a fault condition, such as a non-exiting code loop.

Notational Conventions

This document uses the following conventions.

• Hexadecimal numbers are shown with the suffix h. For example, the following number is 40 hexadecimal (decimal 64): 40h.

• Registers in this document are shown in figures and described in tables.
  – Each register figure shows a rectangle divided into fields that represent the fields of the register. Each field is labeled with its bit name, its beginning and ending bit numbers above, and its read/write properties below. A legend explains the notation used for the properties.
  – Reserved bits in a register figure designate a bit that is used for future device expansion.

Related Documentation From Texas Instruments

SPRU732 — TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide. Describes the CPU architecture, pipeline, instruction set, and interrupts for the TMS320C64x and TMS320C64x+ digital signal processors (DSPs) of the TMS320C6000 DSP family. The C64x/C64x+ DSP generation comprises fixed-point devices in the C6000 DSP platform. The C64x+ DSP is an enhancement of the C64x DSP with added functionality and an expanded instruction set.

SPRU871 — TMS320C64x+ DSP Megamodule Reference Guide. Describes the TMS320C64x+ digital signal processor (DSP) megamodule. Included is a discussion on the internal direct memory access (IDMA) controller, the interrupt controller, the power-down controller, memory protection, bandwidth management, and the memory and cache.

SPRAAA6 — EDMA v3.0 (EDMA3) Migration Guide for TMS320DM644x DMSoC. Describes migrating from the Texas Instruments TMS320C64x digital signal processor (DSP) enhanced direct memory access (EDMA2) to the TMS320DM644x Digital Media System-on-Chip (DMSoC) EDMA3. This document summarizes the key differences between the EDMA3 and the EDMA2 and provides guidance for migrating from EDMA2 to EDMA3.
1 Introduction

This document describes the operation of the software-programmable 64-bit timer in the TMS320DM644x Digital Media System-on-Chip (DMSoC). The DM644x DMSoC processor contains three software-programmable timers. Timer 0 and Timer 1 (general-purpose timers) can be controlled by the ARM or the DSP. Timer 0 and Timer 1 can be programmed in 64-bit mode, dual 32-bit unchained mode, or dual 32-bit chained mode. Timer 2 is used as a watchdog timer and can be controlled by the ARM only.

1.1 Purpose of the Peripheral

The timers support four modes of operation: a 64-bit general-purpose (GP) timer, dual unchained 32-bit GP timers, dual chained 32-bit timers, or a watchdog timer. The GP timer modes can be used to generate periodic interrupts or EDMA synchronization events. The watchdog timer mode is used to provide a recovery mechanism for the device in the event of a fault condition, such as a non-exiting code loop. The capabilities of each of the timers are summarized in Table 1.

1.2 Features

The 64-bit timer consists of the following features.

- 64-bit count-up counter
- Timer modes:
  - 64-bit general-purpose timer mode
  - Dual 32-bit general-purpose timer mode
  - Watchdog timer mode
- 2 possible clock sources:
  - Internal clock
  - External clock input via timer input pin TIN0 (Timer 0 only)
- 2 possible operation modes:
  - One-time operation (timer runs for one period then stops)
  - Continuous operation (timer automatically resets after each period)
- Generates interrupts to both the DSP and the ARM CPUs
- Generates sync event to EDMA
1.3 Functional Block Diagram

A block diagram of the timer is shown in Figure 1. Detailed information about the architecture and operation of the timers is in Section 2 and Section 3.

![Figure 1. Timer Block Diagram](image)

1.4 Industry Standard Compatibility Statement

This peripheral is not intended to conform to any specific industry standard.

2 Architecture – General-Purpose Timer Mode

This section describes the timer in the general-purpose (GP) timer mode. Timer 0 and Timer 1 can be used in GP timer mode. Timer 2 can only be used as a watchdog timer. To use timer 2 as a watchdog timer, see Section 3.

2.1 Clock Control

The timer can use an internal or external clock source for the counter period. The following sections explain how to select the clock source. Table 2 shows which clock sources are supported on each timer.

<table>
<thead>
<tr>
<th>Clock Source</th>
<th>Timer 0</th>
<th>Timer 1</th>
<th>Timer 2</th>

<td>√</td>
<td>√</td>
<td>√</td>
</tr>
<tr>
<td>External clock input (TIN0 pin)</td>
<td>√</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

As shown in Table 3 and Figure 2, the timer clock source is selected using the clock source (CLKSRC12) bit in the timer control register (TCR). Two clock sources are available to drive the timer clock:

- internal clock, by setting CLKSRC12 = 0.
- external clock on timer 0 input pin (TIN0), by setting CLKSRC12 = 1. This input signal is synchronized internally.

At reset, the clock source is the internal clock. Details on each of the clock source configuration options are included in the following sections.
### Table 3. Timer Clock Source Selection

#### 2.1.1 Using the Internal Clock Source to the Timer

The internal clock source to the timer is a fixed on-chip 27 MHz clock. This clock source determines the speed of the timer since the timer counts up based on each cycle of the clock source. When determining the period and prescalers settings for the timer, choose the desired period in terms of number of cycles of the 27 MHz clock. For details on the generation of the on-chip clocks, see the *TMS320DM644x DMSoC ARM Subsystem Reference Guide (SPRUE14)*.

The CLKSRC12 parameter in the timer control register (TCR) controls whether the internal or external clock is used as the clock source for the timer. If the timer is configured in 64-bit mode or 32-bit chained mode, CLKSRC12 controls the clock source for the entire timer. If the timer is configured in dual 32-bit unchained mode (TIMMODE = 01 in TGCR), CLKSRC12 controls the timer 1:2 side of the timer. The timer 3:4 side must use the internal clock.

To select the internal clock as the clock source for the timer, CLKSRC12 in TCR must be cleared to 0. If the timer being used does not support an external clock source, CLKSRC12 must always be 0.

#### 2.1.2 Using the External Clock Source to the Timer (Timer 0 only)

An external clock source can be provided to clock the timer via the TIN0 pin.

The CLKSRC12 parameter in the timer control register (TCR) controls whether the internal or external clock is used as the clock source for the timer. If the timer is configured in 64-bit mode or 32-bit chained mode, CLKSRC12 controls the clock source for the entire timer. If the timer is configured in dual 32-bit unchained mode (TIMMODE = 01 in TGCR), CLKSRC12 controls the timer 1:2 side of the timer. The timer 3:4 side must use the internal clock.

To select the external clock as the clock source for the timer, CLKSRC12 in TCR must be set to 1.

#### 2.2 Signal Descriptions

The timer module provides only one input signal for the timer 0 instantiation. The timer 0 input TIN0 is connected to the input clock circuit to allow timer synchronization to audio streams. The external timer input clock frequency must be no greater than CLK/4, where CLK = the 27 MHz timer peripheral clock.
2.3 Timer Modes

The following section describes the general-purpose (GP) timer modes. To use the timer as a watchdog timer (timer 2 only), see Section 3.

2.3.1 64-Bit Timer Mode (Timer 0 and Timer 1)

The general-purpose timers can each be configured as a 64-bit timer by clearing the TIMMODE bit in the timer global control register (TGCR) to 0. At reset, 0 is the default setting for the TIMMODE bit.

In this mode, the timer operates as a single 64-bit up-counter (Figure 3). The counter registers (TIM12 and TIM34) form a 64-bit timer counter register and the period registers (PRD12 and PRD34) form a 64-bit timer period register. When the timer is enabled, the timer counter starts incrementing by 1 at every timer input clock cycle. When the timer counter matches the timer period, a maskable timer interrupt (TINTn) and a timer EDMA (TEVT) are generated. When the timer is configured in continuous mode, the timer counter is reset to 0 on the cycle after the timer counter reaches the timer period. The timer can be stopped, restarted, reset, or disabled using control bits in TGCR.

Figure 3. 64-Bit Timer Mode Block Diagram

2.3.1.1 Enabling the 64-Bit Timer

The TIM12RS and TIM34RS bits in TGCR control whether the timer is in reset or capable of operating. For the timer to operate in 64-bit timer mode, the TIM12RS and TIM34RS bits must be set to 1.

The ENAMODE12 bit in the timer control register (TCR) controls whether the timer is disabled, enabled to run once, or enabled to run continuously; the ENAMODE34 bit has no effect in 64-bit timer mode. When the timer is disabled (ENAMODE12 = 0), the timer does not run and maintains its current count value. When the timer is enabled for one time operation (ENAMODE12 = 1), it counts up until the counter value equals the period value and then stops. When the timer is enabled for continuous operation (ENAMODE12 = 2h), the counter counts up until it reaches the period value, then resets itself to zero and begins counting again.

Table 4 shows the bit values in TGCR to configure the 64-bit timer.
Table 4. 64-Bit Timer Configurations

<table>
<thead>
<tr>
<th>64-Bit Timer Configuration</th>
<th>TGCR Bit</th>

<td>1h</td>
<td>1h</td>
<td>2h</td>
</tr>
</tbody>
</table>

Once the timer stops, if an external clock is used as the timer clock, the timer must remain disabled for at least one external clock period or the timer will not start counting again. When using the external clock, the count value is synchronized to the internal clock.

Note that when both the timer counter and timer period are cleared to 0, the timer can be enabled but the timer counter does not increment because the timer period is 0.

2.3.1.2 Reading the Counter Registers

When reading the timer count in 64-bit timer mode, the CPU must first read TIM12 followed by TIM34. When TIM12 is read, the timer copies TIM34 into a shadow register. When reading TIM34, the hardware logic forces the reads to read from the shadow register. This ensures that the values read from the registers are not affected by the fact that the timer may continue to run as the registers are read. When reading the timers in 32-bit mode, TIM12 and TIM34 may be read in either order.

2.3.1.3 64-Bit Timer Configuration Procedure

To configure the GP timer to operate as a 64-bit timer, follow the steps below:
1. Select 64-bit mode (TIMMODE in TGCR).
2. Remove the timer from reset (TIM12RS and TIM34RS in TGCR).
3. Select the desired timer period (PRD12 and PRD34).
4. Enable the timer (ENAMODE12 in TCR).

2.3.2 Dual 32-Bit Timer Modes (Timer 0 and Timer 1)

Each of the general-purpose timers can be configured as dual 32-bit timers by configuring the TIMMODE bit in the timer global control register (TGCR). In dual 32-bit timer mode, the two 32-bit timers can be operated independently (unchained mode) or in conjunction with each other (chained mode).

2.3.2.1 Chained Mode

The general-purpose timers can each be configured as a dual 32-bit chained timer by setting the TIMMODE bit to 3h in TGCR.

In the chained mode (Figure 4), one 32-bit timer (timer 3:4) is used as a 32-bit prescaler and the other 32-bit timer (timer 1:2) is used as a 32-bit timer. The 32-bit prescaler is used to clock the 32-bit timer. The 32-bit prescaler uses one counter register (TIM34) to form a 32-bit prescale counter register and one period register (PRD34) to form a 32-bit prescale period register.

When the timer is enabled, the prescale counter starts incrementing by 1 at every timer input clock cycle. One cycle after the prescale counter matches the prescale period, a clock signal is generated and the prescale counter register is reset to 0 (see the example in Figure 5).

The other 32-bit timer (timer 1:2) uses one counter register (TIM12) to form a 32-bit timer counter register and one period register (PRD12) to form a 32-bit timer period register. This timer is clocked by the output clock from the prescaler. The timer counter increments by 1 at every prescaler output clock cycle. When the timer counter matches the timer period, a maskable timer interrupt (TINT) and a timer EDMA event (TEVT) are generated. When the timer is configured in continuous mode, the timer counter is reset to 0 on the cycle after the timer counter reaches the timer period. The timer can be stopped, restarted, reset, or disabled using the TIM12RS and TIM34RS bits in TGCR. In the chained mode, the upper 16-bits of the timer control register (TCR) are not used.
Figure 4. Dual 32-Bit Timers Chained Mode Block Diagram

Figure 5. Dual 32-Bit Timers Chained Mode Example

32-bit prescaler settings: count = TIM34 = 200; period = PRD34 = 202
32-bit timer settings: count = TIM12 = 3; period = PRD12 = 4
2.3.2.1.1 Enabling the 32-Bit Timer Chained Mode

The TIM12RS and TIM34RS bits in TGCR control whether the timer is in reset or capable of operating. The TIM12RS bit controls the reset of the timer 1:2 side of the timer and the TIM34RS bits control the reset of the timer 3:4 side of the timer. For the timer to operate, the TIM12RS and TIM34RS bits must be set to 1.

The ENAMODE12 bit in the timer control register (TCR) controls whether the timer is disabled, enabled to run once, or enabled to run continuously; the ENAMODE34 bit has no effect in 32-bit timer chained mode. When the timer is disabled (ENAMODE12 = 0), the timer does not run and maintains its current count value. When the timer is enabled for one time operation (ENAMODE12 = 1), it counts up until the counter value equals the period value and then stops. When the timer is enabled for continuous operation (ENAMODE12 = 2h), the counter counts up until it reaches the period value, then resets itself to zero and begins counting again.

Table 5 shows the bit values in TGCR to configure the 32-bit timer in chained mode.

<table>
<thead>
<tr>
<th>32-Bit Timer Configuration</th>
<th>TGCR Bit</th>
<th>TCR Bit</th>
</tr>
</thead>
<tbody>
<tr>
<td>To place the 32-bit timer chained mode in reset</td>

<td>2h</td>
</tr>
</tbody>
</table>

Once the timer stops, if an external clock is used as the timer clock, the timer must remain disabled for at least one external clock period or the timer will not start counting again. When using the external clock, the count value is synchronized to the internal clock.

Note that when both the timer counter and timer period are cleared to 0, the timer can be enabled but the timer counter does not increment because the timer period is 0.

2.3.2.1.2 32-Bit Timer Chained Mode Configuration Procedure

To configure the GP timer to operate as a dual 32-bit chained mode timer, follow the steps below:

1. Select 32-bit chained mode (TIMMODE in TGCR).
2. Remove the timer from reset (TIM12RS and TIM34RS in TGCR).
3. Select the desired timer period (PRD12).
4. Select the desired timer prescaler value (PRD34).
5. Enable the timer (ENAMODE12 in TCR).
2.3.2.2 Unchained Mode

The general-purpose timers can each be configured as a dual 32-bit unchained timers by setting the TIMMODE bit to 1 in TGCR.

In the unchained mode (Figure 6), the timer operates as two independent 32-bit timers. One 32-bit timer (timer 3:4) operates as a 32-bit timer being clocked by a 4-bit prescaler. The other 32-bit timer (timer 1:2) operates as a 32-bit timer with no prescaler.

Figure 6. Dual 32-Bit Timers Unchained Mode Block Diagram

2.3.2.2.1 32-Bit Timer With a 4-Bit Prescaler

In the unchained mode, the 4-bit prescaler must be clocked by the internal clock; an external clock source cannot be used for timer 3:4. The 4-bit prescaler uses the timer divide-down ratio (TDDR34) bit in TGCR to form a 4-bit prescale counter register and the prescale counter bits (PSC34) to form a 4-bit prescale period register (see Figure 6). When the timer is enabled, the prescale counter starts incrementing by 1 at every timer input clock cycle. One cycle after the prescale counter matches the prescale period, a clock signal is generated for the 32-bit timer.

The 32-bit timer uses TIM34 as a 32-bit timer counter register and PRD34 as a 32-bit timer period register. The 32-bit timer is clocked by the output clock from the 4-bit prescaler (see the example in Figure 7). The timer counter increments by 1 at every prescaler output clock cycle. When the timer counter matches the timer period, a maskable timer interrupt (TINTn) and a timer EDMA event (TEVT) are generated. When the timer is configured in continuous mode, the timer counter is reset to 0 on the cycle after the timer counter reaches the timer period. The timer can be stopped, restarted, reset, or disabled using the TIM34RS bit in TGCR. For timer 3:4, the lower 16 bits of the timer control register (TCR) have no control.
2.3.2.2.2 32-Bit Timer with No Prescaler

The other 32-bit timer (timer 1:2) uses TIM12 as the 32-bit counter register and PRD12 as a 32-bit timer period register (see Figure 6). When the timer is enabled, the timer counter increments by 1 at every timer input clock cycle. When the timer counter matches the timer period, a maskable timer interrupt (TINTn) and a timer EDMA event (TEVT) are generated. When the timer is configured in continuous mode, the timer counter is reset to 0 on the cycle after the timer counter reaches the timer period. The timer can be stopped, restarted, reset, or disabled using the TIM12RS bit in TGCR. For timer 1:2, the upper 16 bit of the timer control register (TCR) have no control.

2.3.2.2.3 Enabling the 32-Bit Unchained Mode Timer

The TIM12RS and TIM34RS bits in TGCR control whether the timer is in reset or capable of operating. The TIM12RS bit controls the reset of the timer 1:2 side of the timer and the TIM34RS bit controls the reset of the timer 3:4 side of the timer. For the timer to operate, the TIM12RS and/or TIM34RS bits must be set to 1.

The ENAMODEn bit in the timer control register (TCR) controls whether the timer is disabled, enabled to run once or enabled to run continuously. When the timer is disabled (ENAMODEn = 0), the timer does not run and maintains its current count value. When the timer is enabled for one time operation (ENAMODEn = 1), it counts up until he counter value equals the period value and then stops. When the timer is enabled for continuous operation (ENAMODEn = 2h), the counter counts up until it reaches the period value, then resets itself to zero and begins counting again.

Table 6 shows the bit values in TGCR to configure the 32-bit timer in unchained mode.

Once the timer stops, if an external clock is used as the timer clock, the timer must remain disabled for at least one external clock period or the timer will not start counting again. When using the external clock, the count value is synchronized to the internal clock. External clock is only available on the timer 1:2 side in unchained mode.

Note that when both the timer counter and timer period are cleared to 0, the timer can be enabled but the timer counter does not increment because the timer period is 0.

2.3.2.2.4 32-Bit Timer Unchained Mode Configuration Procedure

To configure timer 1:2, follow the steps below:
1. Select 32-bit unchained mode (TIMMODE in TGCR).
2. Remove the timer 1:2 from reset (TIM12RS in TGCR).
3. Select the desired timer period for timer 1:2 (PRD12).
4. Select the desired clock source for timer 1:2 (CLKSRC12 in TCR).
5. Enable timer 1:2 (ENAMODE12 in TCR).

To configure timer 3:4, follow the steps below:
1. Select 32-bit unchained mode (TIMMODE in TGCR).
2. Remove the timer 3:4 from reset (TIM34RS in TGCR).
3. Select the desired timer period for timer 3:4 (PRD34).
4. Select the desired prescaler value for timer 3:4 (PSC34 in TGCR).
5. Enable timer 3:4 (ENAMODE34 in TCR).

2.3.3 Counter and Period Registers Used in GP Timer Modes

Table 7 summarizes how the counter registers (TIMn) and period registers (PRDn) are used in each GP timer mode.

2.4 Timer Operation Boundary Conditions

The following boundary conditions affect the timer operation.

2.4.1 Timer Counter Overflow

Timer counter overflow can happen when the timer counter register is set to a value greater than the value in the timer period register. The counter reaches its maximum value (FFFF FFFFh or FFFF FFFF FFFF FFFFh), rolls over to 0, and continues counting until it reaches the timer period. An example is in Figure 8.

![Figure 8. 32-Bit Timer Counter Overflow Example](image)

2.4.2 Writing to Registers of an Active Timer

Writes to the timer registers are not allowed when the timer is active, except for stopping or resetting the timers. In the 64-bit and dual 32-bit timer modes, registers that are protected by hardware are:

- TIM12
- TIM34
- PRD12
- PRD34
- TCR (except the ENAMODE bit)
- TGCR (except the TIM12RS and TIM34RS bits)

2.5 General-Purpose Timer Power Management

The timer can be placed in reduced power modes to conserve power during periods of low activity. The power management of the peripheral is controlled by the processor Power and Sleep Controller (PSC). The PSC acts as a master controller for power management for all of the peripherals on the device. For detailed information on power management procedures using the PSC, see the *TMS320DM644x DMSoC ARM Subsystem Reference Guide* (SPRUE14). The timer can be placed in an idle mode to conserve power when it is not being used.

3 Architecture – Watchdog Timer Mode

This section describes the use of timer 2 as a watchdog timer. Timers 0 and 1 can only be used as general-purpose timers. To use timer 0 or timer 1 as general-purpose timers, see Section 2.

3.1 Watchdog Timer

Timer 2 can be configured only as a 64-bit watchdog timer. As a watchdog timer, it can be used to prevent system lockup when the software becomes trapped in loops with no controlled exit.

After a hardware reset, the watchdog timer is disabled. The timer then can be configured as a watchdog timer using the timer mode (TIMMODE) bit in the timer global control register (TGCR) and the watchdog timer enable (WDEN) bit in the watchdog timer control register (WDTCR). In the watchdog timer mode, the timer requires a special service sequence to be executed periodically. Without this periodic servicing, the timer counter increments until it matches the timer period and causes a watchdog timeout event.

When the timeout event occurs, the watchdog timer resets the entire processor.
3.2 Watchdog Timer Mode Restrictions

The watchdog timer mode has the following restrictions:
- No external clock source
- No one-time enabling

3.3 Watchdog Timer Mode Operation

The watchdog timer mode is selected and enabled when:
- TIMMODE = 2h in TGCR
- WDEN = 1 in WDTCR

Figure 9 shows the timer when it is used in the watchdog timer mode. The counter registers (TIM12 and TIM34) form a 64-bit timer counter register and the period registers (PRD12 and PRD34) form a 64-bit period register. When the timer counter matches the timer period, the timer generates a watchdog timeout event which resets the entire processor.

To activate the watchdog timer, a certain sequence of events must be followed, as shown in the state diagram of Figure 10.

Once the watchdog timer is activated, it can be disabled only by a watchdog timeout event or by a hardware reset. A special key sequence is required to prevent the watchdog timer from being accidentally serviced while the software is trapped in a loop or by some other software failure.
To prevent a watchdog timeout event, the timer has to be serviced periodically by writing A5C6h followed by DA7Eh to the watchdog timer service key (WDKEY) bits in WDTCR before the timer finishes counting up. Both A5C6h and DA7Eh are allowed to be written to the WDKEY bits, but only the correct sequence of A5C6h followed by DA7Eh to the WDKEY bits services the watchdog timer. Any other writes to the WDKEY bits triggers the watchdog timeout event immediately.

When the watchdog timer is in the Timeout state, the watchdog timer is disabled, the WDEN bit is cleared to 0, and the timer is reset. After entering the Timeout state, the watchdog timer cannot be enabled again until a hardware reset occurs.

After a hardware reset, the watchdog timer is disabled; however, reads or writes to the watchdog timer registers are allowed. Once the WDEN bit is set (enabling the watchdog timer) and A5C6h is written to the WDKEY bits, the watchdog timer enters the Pre-active state. In the Pre-active state:

- A write to WDTCR is allowed only when the write comes with the correct key (A5C6h or DA7Eh) to the WDKEY bits.
- A write of DA7Eh to the WDKEY bits when the WDEN bit is set to 1 resets the counters and activates the watchdog timer.

The watchdog timer must be configured before the watchdog timer enters the Active state. The WDEN bit must be set to 1 before writing DA7Eh to the WDKEY bits in the Pre-active state. Every time the watchdog timer is serviced by the correct WDKEY sequence, the watchdog timer counter is automatically reset.
3.4 **Watchdog Timer Register Write Protection**

Once the watchdog timer enters the Pre-active state (see Figure 10), writes to TIM12, TIM34, PRD12, PRD34, and WDTCR are write protected (except for the WDKEY field). While the watchdog timer is in the Timeout state, writing to the WDEN bit has no effect.

Once the watchdog timer enters its Initial state (see Figure 10), do not write to TGCR.

3.5 **Watchdog Timer Power Management**

The watchdog timer cannot be placed in power-down mode.

4 **Reset Considerations**

The timer has two reset sources: hardware reset and the timer reset (TIM12RS and TIM34RS) bits in the timer global control register (TGCR).

4.1 **Software Reset Considerations**

When the TIM12RS bit in the timer global control register (TGCR) is cleared to 0, the TIM12 register is held with the current value.

When the TIM34RS bit in the timer global control register (TGCR) is cleared to 0, the TIM34 register is held with the current value.

**Emulator software reset:** In the event of an emulator software reset initiated from the ARM side, the timer register values are reset to their default values. In the event of an emulator software reset initiated from the DSP side, the timer register values are unaffected.

4.2 **Hardware Reset Considerations**

When a hardware reset is asserted, all timer registers are set to their default values.

5 **Interrupt Support**

Each of the timers can send either one of two separate interrupt events (TINTn) to the ARM and/or the DSP, depending on the operating mode of the timer. The timer interrupts are generated when the count value in the counters register reaches the value specified in the period register.

**Table 8** shows the interrupts generated in each mode on each instance of the timer.

<table>

<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>
6 EDMA Event Support

Each of the timers can send either one of two separate timer events (TEVTn) to the EDMA, depending on the operating mode the timer. The timer events are generated when the count value in the counters register reaches the value specified in the period register.

Table 9 shows the EDMA events generated in each mode on each instance of the timer.

</tr>
</tbody>
</table>

7 Power Management

The general purpose timers can be placed in reduced power modes to conserve power during periods of low activity. The power management of the peripheral is controlled by the processor Power and Sleep Controller (PSC). The PSC acts as a master controller for power management for all of the peripherals on the device. For detailed information on power management procedures using the PSC, see the TMS320DM644x DMSoC ARM Subsystem Reference Guide (SPRUE14).

8 Emulation Considerations

Each timer has an emulation management register (EMUMGT). As shown in Table 10, the FREE and SOFT bits of EMUMGT determine how the timer responds to an emulation suspend event. An emulation suspend event corresponds to any type of emulator access to either the ARM or the DSP, such as a hardware or software breakpoint or a probe point.

<table>
<thead>
<tr>
<th>FREE</th>
<th>SOFT</th>
<th>Emulation Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>The timer stops immediately.</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>The timer stops when the timer counter value increments and reaches the value in the timer period register.</td>
</tr>
<tr>
<td>1</td>
<td>x</td>
<td>The timer runs free regardless of SOFT bit status.</td>
</tr>
</tbody>
</table>

Note that during emulation, the timer count values will increment once every timer peripheral clock (not CPU clock). So when single-stepping through code, the timer values will not update on every CPU clock cycle.

The timer can respond to emulation events from the ARM or the DSP CPU based on the configuration of the emulation suspend source register (SUSPSRC). See the data manual for detailed information on SUSPSRC and how it is configured.
9 Registers

Table 11 lists the memory-mapped registers for the 64-bit timer. See the device-specific data manual for the memory address of these registers. All other register offset addresses not listed in Table 11 should be considered as reserved locations and the register contents should not be modified.

9.3 Timer Counter Registers (TIM12 and TIM34)

The timer counter register is a 64-bit wide register. This 64-bit register is divided into two 32-bit registers, TIM12 and TIM34.

In the dual 32-bit timer mode, the 64-bit register is divided with TIM12 acting as one 32-bit counter and TIM34 acting as another. These two registers can be configured as chained or unchained.

9.3.1 Timer Counter Register 12 (TIM12)

The timer counter register 12 (TIM12) is shown in Figure 13 and described in Table 14.

**Table 15. Timer Counter Register 34 (TIM34) Field Descriptions**
9.4 Timer Period Registers (PRD12 and PRD34)

The timer period register is a 64-bit wide register. This 64-bit register is divided into two 32-bit registers, PRD12 and PRD34.

Similar to TIM\(n\) in the dual 32-bit timer mode, PRD\(n\) can be divided into 2 registers: for timer 1:2, PRD12 and for timer 3:4, PRD34. These two registers can be used in conjunction with the two timer counter registers TIM12 and TIM34.

9.4.1 Timer Period Register (PRD12)

The timer period register 12 (PRD12) is shown in Figure 15 and described in Table 16.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal and regulatory requirements concerning such use. TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated TI products in automotive applications, TI will not be responsible for any failure to meet such requirements.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic."

Only products designated by TI as military-grade meet military specifications. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.
