

# DRV8885 電流検出機能を内蔵した1.5Aステッピング・モータ・ドライバ

## 1 特長

- PWMマイクロステッピングのステッピング・モータ・ドライバ
  - 最高1/16のマイクロステッピング
  - 非循環および標準の1/2ステップ・モード
- 電流検出機能を搭載
  - 検出抵抗が不要
  - $\pm 6.25\%$ のフルスケール電流精度
- 低速および混合減衰オプション
- 8.0~37Vの電源電圧範囲で動作
- 低い $R_{DS(ON)}$ : 24V、25°Cで $0.86\Omega$  HS + LS
- 高い電流容量
  - ブリッジごとにフルスケールで1.5A
  - ブリッジごとにrms 1.0A
- 固定オフ時間のPWMチョッピング
- シンプルなSTEP/DIRインターフェイス
- 低消費電流のスリープ・モード(20 $\mu$ A)
- 小さなパッケージと占有面積
  - 24 HTSSOP PowerPAD™パッケージ
  - 28 WQFNパッケージ
- 保護機能
  - VM低電圧誤動作防止(UVLO)
  - チャージ・ポンプ低電圧(CPUV)
  - 過電流保護(OCP)
  - サーマル・シャットダウン(TSD)
  - フォルト状況表示ピン(nFAULT)

## 2 アプリケーション

- 多機能プリンタおよびスキャナ
- レーザー・ビーム・プリンタ
- 3Dプリンタ
- 現金自動預払機および金銭処理機
- 防犯カメラ
- OA機器
- ファクトリ・オートメーションおよびロボティクス

## 3 概要

DRV8885は、産業用機器アプリケーション向けのステッピング・モータ・ドライバです。このデバイスには2つのNチャネル・パワーMOSFET Hブリッジ・ドライバ、マイクロステッピング・インデクサ、および電流検出機能が組み込まれています。DRV8885は、フルスケールで1.5A、rmsで1.0Aまでの出力電流を供給できます(24Vおよび $T_A = 25^\circ\text{C}$ の場合。放熱のため適切なPCBグラウンド・プレーンが必要です)。

DRV8885には電流検出機能が組み込まれているため、2つの外部検出抵抗が必要ありません。

### 製品情報 (1)

| 型番      | パッケージ       | 本体サイズ(公称)     |
|---------|-------------|---------------|
| DRV8885 | HTSSOP (24) | 7.80mm×4.40mm |
|         | WQFN (28)   | 5.50mm×3.5mm  |

(1) 利用可能なすべてのパッケージについては、このデータシートの末尾にある注文情報を参照してください。

## 4 改訂履歴

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

| Revision B (July 2018) から Revision C に変更 | Page |
|------------------------------------------|------|
| • デバイスのステータスを「事前情報」から「量産データ」に変更 .....    | 1    |

| Revision A (April 2016) から Revision B に変更                                                                                          | Page |
|------------------------------------------------------------------------------------------------------------------------------------|------|
| • WQFNパッケージ・オプション 追加 .....                                                                                                         | 1    |
| • Deleted <i>and internal indexer</i> from the description of the ENABLE pin in the <i>Pin Functions</i> table.....                | 4    |
| • Changed <i>until ENABLE is deasserted</i> to <i>until ENABLE is asserted</i> in the <i>Device Functional Modes</i> section ..... | 27   |
| • 追加「ドキュメントの更新通知を受け取る方法」セクション .....                                                                                                | 33   |

| 2015年10月発行のものから更新                                             | Page |
|---------------------------------------------------------------|------|
| • Updated peak drive current based on OCP .....               | 5    |
| • Updated $R_{PD}$ and $R_{PU}$ values .....                  | 7    |
| • Fixed chopping current equation .....                       | 19   |
| • Added "Controlling RREF with a PWM Resource" .....          | 19   |
| • Fixed resistance values in tri-level input pin diagram..... | 25   |

## 5 概要（続き）

STEP/DIRピンは、シンプルな制御インターフェイスとして使用できます。デバイスは、フルステップから1/16ステップまでのモードに構成可能です。低消費電力のスリープ・モードが用意されており、専用のnSLEEPピンを使用することで、静止電流の非常に低いスタンバイ・モードに移行できます。

低電圧、チャージ・ポンプ障害、過電流、短絡、過熱への保護機能が内蔵されています。フォルト状況は、nFAULTピンにより示されます。

| AOUT1  | 5       | 3    | O                   | Winding A output. Connect to stepper motor winding.                                                                                 |
| AOUT2  | 7       | 5    |                     |                                                                                                                                     |
| AVDD   | 13      | 12   | PWR                 | Internal regulator. Bypass to GND with a X5R or X7R, 0.47-μF, 6.3-V ceramic capacitor.                                              |
| BOUT1  | 10      | 8    | O                   | Winding B output. Connect to stepper motor winding.                                                                                 |
| BOUT2  | 8       | 6    |                     |                                                                                                                                     |
| CPH    | 2       | 28   | PWR                 | Charge pump switching node. Connect a X5R or X7R, 0.022-μF, VM-rated ceramic capacitor from CPH to CPL.                             |
| CPL    | 1       | 27   |                     |                                                                                                                                     |
| DECAY  | 24      | 25   | I                   | Decay-mode setting. Sets the decay mode (see the <a href="#">Decay Modes</a> section). Decay mode can be adjusted during operation. |
| DIR    | 20      | 21   | I                   | Direction input. Logic level sets the direction of stepping; internal pulldown resistor.                                            |
| DVDD   | 14      | 13   | PWR                 | Internal regulator. Bypass to GND with a X5R or X7R, 0.47-μF, 6.3-V ceramic capacitor.                                              |
| ENABLE | 18      | 19   | I                   | Enable driver input. Logic high to enable device outputs; logic low to disable; internal pulldown resistor.                         |
| GND    | 12      | 10   | PWR                 | Device ground. Connect to system ground.                                                                                            |
| M0     | 21      | 22   | I                   | Microstepping mode-setting. Sets the step mode; tri-level pins; sets the step mode; internal pulldown resistor.                     |
| M1     | 22      | 23   |                     |                                                                                                                                     |
| NC     | —       | 11   | —                   | No connect. No internal connection                                                                                                  |
|        |         | 14   |                     |                                                                                                                                     |
|        |         | 15   |                     |                                                                                                                                     |
|        |         | 26   |                     |                                                                                                                                     |
| PGND   | 6       | 4    | PWR                 | Power ground. Connect to system ground.                                                                                             |
|        | 9       | 7    |                     |                                                                                                                                     |
| RREF   | 16      | 17   | I                   | Current-limit analog input. Connect a resistor to ground to set full-scale regulation current.                                      |

(1) I = input, O = output, PWR = power, OD = open-drain

## Pin Functions (continued)

| NAME   | PIN NO. |      | TYPE <sup>(1)</sup> | DESCRIPTION                                                                                                                                                |
|--------|---------|------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
|        | HTSSOP  | WQFN |                     |                                                                                                                                                            |
| STEP   | 19      | 20   | I                   | Step input. A rising edge causes the indexer to advance one step; internal pulldown resistor.                                                              |
| TRQ    | 23      | 24   | I                   | Current-scaling control. Scales the output current; tri-level pin.                                                                                         |
| VCP    | 3       | 1    | PWR                 | Charge pump output. Connect a X5R or X7R, 0.22-μF, 16-V ceramic capacitor to VM.                                                                           |
| VM     | 4       | 2    | PWR                 | Power supply. Connect to motor supply voltage and bypass to GND with two 0.01-μF ceramic capacitors (one for each pin) plus a bulk capacitor rated for VM. |
|        | 11      | 9    |                     |                                                                                                                                                            |
| nFAULT | 15      | 16   | OD                  | Fault indication. Pulled logic low with fault condition; open-drain output requires an external pullup resistor.                                           |
| nSLEEP | 17      | 18   | I                   | Sleep mode input. Logic high to enable device; logic low to enter low-power sleep mode; internal pulldown resistor.                                        |

## 7 Specifications

### 7.1 Absolute Maximum Ratings

|-----------------------------------------------------------------------------|------|----------|------|
| Power supply voltage (VM)                                                   | −0.3 | 40       | V    |
| Power supply voltage ramp rate (VM)                                         | 0    | 2        | V/μs |
| Charge pump voltage (VCP, CPH)                                              | −0.3 | VM + 7   | V    |
| Charge pump negative switching pin (CPL)                                    | −0.3 | VM       | V    |
| Internal regulator voltage (DVDD)                                           | −0.3 | 3.8      | V    |
| Internal regulator current output (DVDD)                                    | 0    | 1        | mA   |
| Internal regulator voltage (AVDD)                                           | −0.3 | 5.7      | V    |
| Control pin voltage (STEP, DIR, ENABLE, nFAULT, M0, M1, DECAY, TRQ, nSLEEP) | −0.3 | 5.7      | V    |
| Open drain output current (nFAULT)                                          | 0    | 10       | mA   |
| Current limit input pin voltage (RREF)                                      | −0.3 | 6.0      | V    |
| Continuous phase node pin voltage (AOUT1, AOUT2, BOUT1, BOUT2)              | −0.7 | VM + 0.7 | V    |
| Peak drive current (AOUT1, AOUT2, BOUT1, BOUT2)                             |      | 2.3      | A    |
| Operating junction temperature, T <sub>J</sub>                              | −40  | 150      | °C   |
| Storage temperature, T <sub>stg</sub>                                       | −65  | 150      | °C   |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 7.2 ESD Ratings

|                                            |                                                                                | VALUE | UNIT |
|--------------------------------------------|--------------------------------------------------------------------------------|-------|------|
| V <sub>(ESD)</sub> Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>              | ±2000 | V    |
|                                            | Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup> | ±500  |      |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

## 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|            |                               | MIN | MAX                | UNIT |
|------------|-------------------------------|-----|--------------------|------|
| VM         | Power supply voltage range    | 8   | 37                 | V    |
| VCC        | Logic level input voltage     | 0   | 5.3                | V    |
| $f_{PWM}$  | Applied STEP signal (STEP)    | 0   | 100 <sup>(1)</sup> | kHz  |
| $I_{DVDD}$ | DVDD external load current    | 0   | 1 <sup>(2)</sup>   | mA   |
| $I_{FS}$   | Motor full scale current      | 0   | 1.5                | A    |
| $I_{rms}$  | Motor rms current             | 0   | 1.0                | A    |
| $T_A$      | Operating ambient temperature | –40 | 125                | °C   |

(1) STEP input can operate up to 500 kHz, but system bandwidth is limited by the motor load

(2) Power dissipation and thermal limits must be observed

## 7.4 Thermal Information

| THERMAL METRIC <sup>(1)</sup> |                                              | DRV8885      |            | UNIT |
|-------------------------------|----------------------------------------------|--------------|------------|------|

## 8 Detailed Description

### 8.1 Overview

The DRV8885 is an integrated motor driver solution for bipolar stepper motors. The device integrates two NMOS H-bridges, integrated current sense and regulation circuitry, and a microstepping indexer. The DRV8885 can be powered with a supply voltage between 8 and 37 V, and is capable of providing an output current up to 2.3-A peak, 1.5-A full-scale, or 1.0-A rms. Actual full-scale and rms current will depend on ambient temperature, supply voltage, and PCB ground plane size.

The DRV8885 integrates current sense functionality, which eliminates the need for high-power external sense resistors. This integration does not dissipate the external sense resistor power, because the current sense functionality is not implemented using a resistor-based architecture. This functionality helps improve component cost, board size, PCB layout, and system power consumption.

A simple STEP/DIR interface allows easy interfacing to the controller circuit. The internal indexer is able to execute high-accuracy microstepping without requiring the processor to control the current level. The indexer is capable of full step and half step as well as microstepping to 1/4, 1/8, and 1/16. In addition to the standard half stepping mode, a non-circular 1/2-stepping mode is available for increased torque output at higher motor rpm.

The current regulation is configurable with several decay modes of operation. The decay mode can be selected as a fixed slow, slow/mixed, or mixed decay. The slow/mixed decay mode uses slow decay on increasing steps and mixed decay on decreasing steps.

An adaptive blanking time feature automatically scales the minimum drive time with output current. This helps alleviate zero-crossing distortion by limiting the drive time at low-current steps.

A torque DAC feature allows the controller to scale the output current without needing to scale the reference resistor. The torque DAC is accessed using a digital input pin. This allows the controller to save power by decreasing the current consumption when not high current is not required.

A low-power sleep mode is included which allows the system to save power when not driving the motor.

## 8.3 Feature Description

Table 1 lists the recommended external components for the DRV8885 device.

**Table 1. External Components**

| COMPONENT    | PIN 1              | PIN 2  | RECOMMENDED                                                                                                                    |
|--------------|--------------------|--------|--------------------------------------------------------------------------------------------------------------------------------|
| $C_{VM}$     | VM                 | GND    | Two 0.01- $\mu$ F ceramic capacitors rated for VM                                                                              |
| $C_{VM}$     | VM                 | GND    | Bulk electrolytic capacitor rated for VM                                                                                       |
| $C_{VCP}$    | VCP                | VM     | 16-V, 0.22- $\mu$ F ceramic capacitor                                                                                          |
| $C_{SW}$     | CPH                | CPL    | 0.022- $\mu$ F X7R capacitor rated for VM                                                                                      |
| $C_{AVDD}$   | AVDD               | GND    | 6.3-V, 0.47- $\mu$ F ceramic capacitor                                                                                         |
| $C_{DVDD}$   | DVDD               | GND    | 6.3-V, 0.47- $\mu$ F ceramic capacitor                                                                                         |
| $R_{nFAULT}$ | VCC <sup>(1)</sup> | nFAULT | >4.7 k $\Omega$                                                                                                                |
| $R_{REF}$    | RREF               | GND    | Resistor to limit chopping current must be installed. See the <a href="#">Typical Application</a> section for value selection. |

(1) VCC is not a pin on the DRV8885, but a VCC supply voltage pullup is required for open-drain output nFAULT; nFAULT may be pulled up to DVDD

### 8.3.1 Stepper Motor Driver Current Ratings

Stepper motor drivers can be classified using three different numbers to describe the output current: peak, rms, and full-scale.

#### 8.3.1.1 Peak Current Rating

The peak current in a stepper driver is limited by the overcurrent protection trip threshold  $I_{OCP}$ . The peak current describes any transient duration current pulse, for example when charging capacitance, when the overall duty cycle is very low. In general the minimum value of  $I_{OCP}$  specifies the peak current rating of the stepper motor driver. For the DRV8885, the peak current rating is 2.3 A per bridge.

#### 8.3.1.2 RMS Current Rating

The rms (average) current is determined by the thermal considerations of the IC. The rms current is calculated based on the  $R_{DS(ON)}$ , rise and fall time, PWM frequency, device quiescent current, and package thermal performance in a typical system at 25°C. The real operating rms current may be higher or lower depending on heatsinking and ambient temperature. For the DRV8885, the rms current rating is 1.0 A per bridge.

#### 8.3.1.3 Full-Scale Current Rating

The full-scale current describes the top of the sinusoid current waveform while microstepping. Since the sineusoid amplitude is related to the rms current, the full-scale current is also determined by the thermal considerations of the IC. The full-scale current rating is approximately  $\sqrt{2} \times I_{rms}$ . The full-scale current is set by VREF, the sense resistor, and Torque DAC when configuring the DRV8885, see [Current Regulation](#) for details. For the DRV8885, the full-scale current rating is 1.5 A per bridge.

**Figure 12. Full-Scale and rms Current**

### 8.3.2 PWM Motor Drivers

The DRV8885 contains drivers for two full H-bridges. [Figure 13](#) shows a block diagram of the circuitry.

**Figure 13. PWM Motor Driver Block Diagram**

### 8.3.3 Microstepping Indexer

Built-in indexer logic in the DRV8885 allows a number of different stepping configurations. The Mx pins are used to configure the stepping format as shown in [Table 2](#).

**Table 2. Microstepping Settings**

| M1 | M0 | STEP MODE                                       |
|----|----|-------------------------------------------------|
| 0  | 0  | Full step (2-phase excitation) with 71% current |
| 0  | 1  | 1/16 step                                       |
| 1  | 0  | 1/2 step                                        |
| 1  | 1  | 1/4 step                                        |
| 0  | Z  | 1/8 step                                        |
| 1  | Z  | Non-circular 1/2 step                           |

[Table 3](#) shows the relative current and step directions for full-step through 1/16-step operation. The AOUT current is the sine of the electrical angle; BOUT current is the cosine of the electrical angle. Positive current is defined as current flowing from xOUT1 to xOUT2 while driving.

At each rising edge of the STEP input the indexer travels to the next state in the table. The direction is shown with the DIR pin logic high. If the DIR pin is logic low, the sequence is reversed.

On power-up or when exiting sleep mode, keep the STEP pin logic low, otherwise the indexer will advance one step.

Note that if the step mode is changed from full,  $\frac{1}{2}$ ,  $\frac{1}{4}$ ,  $\frac{1}{8}$ , or  $\frac{1}{16}$  to full,  $\frac{1}{2}$ ,  $\frac{1}{4}$ ,  $\frac{1}{8}$ , or  $\frac{1}{16}$  while stepping, the indexer will advance to the next valid state for the new MODE setting at the rising edge of STEP. If the step mode is changed from or to non-circular  $\frac{1}{2}$  step the indexer will go immediately to the valid state for that mode.

The home state is an electrical angle of  $45^\circ$ . This state is entered after power-up, after exiting logic undervoltage lockout, or after exiting sleep mode. This is shown in the table below with cells outlined in red.

**Table 3. Microstepping Relative Current Per Step (DIR = 1)**

|           | 1        | 1        | 1        | 1         | 360.000°                         | 0%                                | 100%                              |

Non-circular 1/2–step operation is shown below. This stepping mode consumes more power than circular 1/2–step operation, but provides a higher torque at high motor rpm.

**Table 4. Non-Circular 1/2-Stepping Current**

| NON-CIRCULAR 1/2 STEP | AOUT CURRENT<br>(% FULL-SCALE) | BOUT CURRENT<br>(% FULL-SCALE) | ELECTRICAL ANGLE<br>(DEGREES) |

### 8.3.4 Current Regulation

The current through the motor windings is regulated by an adjustable fixed-off-time PWM current regulation circuit. When an H-bridge is enabled, current rises through the winding at a rate dependent on the DC voltage, inductance of the winding, and the magnitude of the back EMF present. Once the current hits the current chopping threshold, the bridge enters a decay mode for a fixed, 20  $\mu$ s, period of time to decrease the current. After the off time expires, the bridge is re-enabled, starting another PWM cycle.

**Figure 14. Current Chopping Waveform**

The PWM chopping current is set by a comparator which looks at the voltage across current sense FETs in parallel with the low-side drivers. The current sense FETs are biased with a reference current that is the output of a current-mode sine-weighted DAC whose full-scale reference current is set by the current through the RREF pin. An external resistor is placed from the RREF pin to GND in order to set the reference current. In addition, the TRQ pin can further scale the reference current.

The chopping current is calculated as follows:

$$I_{FS} (A) = \frac{A_{RREF} (kA\Omega)}{RREF (k\Omega)} \times TRQ (\%) = \frac{30 (kA\Omega)}{RREF (k\Omega)} \times TRQ (\%) \quad (1)$$

Example: If a 30-k $\Omega$  resistor is connected to the RREF pin, the chopping current will be 1 A (TRQ at 100%)

The TRQ pin is the input to a DAC used to scale the output current. The current scalar value for different inputs is shown below.

**Table 5. Torque DAC Settings**

| TRQ | CURRENT SCALAR (TRQ) |
|-----|----------------------|
| 0   | 100%                 |
| Z   | 75%                  |
| 1   | 50%                  |

### 8.3.5 Controlling RREF With an MCU

In some cases, the full-scale output current may need to be changed on the fly between many different values, depending on motor speed and loading. The RREF pin reference current can be adjusted in system by tying the RREF resistor to a DAC output instead of GND.

In this mode of operation, as the DAC voltage increases, the reference current will decrease and therefore the full-scale current will decrease as well. For proper operation, the output of the DAC should not rise above  $V_{RREF}$ .

Copyright © 2016, Texas Instruments Incorporated

**Figure 15. Controlling RREF with a DAC**

The chopping current as controlled by a DAC is calculated as follows:

$$I_{FS} (A) = \frac{A_{RREF} (k\Omega) \times [V_{RREF} (V) - V_{DAC} (V)]}{V_{RREF} (V) \times R_{REF} (k\Omega)} \times TRQ (\%) \quad (2)$$

Example: If a 20-k $\Omega$  resistor is connected from the RREF pin to the DAC, and the DAC is outputting 0.74 V, the chopping current will be 600 mA (TRQ at 100%)

RREF can also be adjusted using a PWM signal and low-pass filter.

**Figure 16. Controlling RREF with a PWM Resource**

### 8.3.6 Decay Modes

The DRV8885 decay mode is selected by setting the quad-level DECAY pin to the voltage range in [Table 6](#).

**Table 6. Decay Mode Settings**

| DECAY                           | INCREASING STEPS      | DECREASING STEPS      |
|---------------------------------|-----------------------|-----------------------|
| 100 mV<br>Can be tied to ground | Slow decay            | Mixed decay: 30% fast |
| 300 mV, 15 kΩ to GND            | Mixed decay: 30% fast | Mixed decay: 30% fast |
| 1.0 V, 45 kΩ to GND             | Mixed decay: 60% fast | Mixed decay: 60% fast |
| 2.9 V<br>Can be tied to DVDD    | Slow decay            | Slow decay            |

Increasing and decreasing current are defined in the chart below. For the Slow/Mixed decay mode, the decay mode is set as slow during increasing current steps and mixed decay during decreasing current steps. In full step mode the decreasing steps decay mode is always used.

**Figure 17. Definition of Increasing and Decreasing Steps**

### 8.3.6.1 Mode 1: Slow Decay for Increasing and Decreasing Current

**Figure 18. Slow/Slow Decay Mode**

During slow decay, both of the low side FETs of the H-bridge are turned on, allowing the current to be recirculated.

Slow decay exhibits the least current ripple of the decay modes for a given  $t_{OFF}$ . However on decreasing current steps, slow decay will take a long time to settle to the new  $I_{TRIP}$  level because the current decreases very slowly.

### 8.3.6.2 Mode 2: Slow Decay for Increasing Current, Mixed Decay for Decreasing Current

**Figure 19. Slow/Mixed Decay Mode**

Mixed decay begins as fast decay for a time, followed by slow decay for the remainder of  $t_{\text{OFF}}$ . In this mode, mixed decay only occurs during decreasing current. Slow decay is used for increasing current.

This mode exhibits the same current ripple as slow decay for increasing current, since for increasing current, only slow decay is used. For decreasing current, the ripple is larger than slow decay, but smaller than fast decay. On decreasing current steps, mixed decay will settle to the new  $I_{\text{TRIP}}$  level faster than slow decay.

### 8.3.6.3 Mode 3: Mixed Decay for Increasing and Decreasing Current

**Figure 20. Mixed/Mixed Decay Mode**

Mixed decay begins as fast decay for a time, followed by slow decay for the remainder of  $t_{OFF}$ . In this mode, mixed decay occurs for both increasing and decreasing current steps.

This mode exhibits ripple larger than slow decay, but smaller than fast decay. On decreasing current steps, mixed decay will settle to the new  $I_{TRIP}$  level faster than slow decay.

In cases where current is held for a long time (no input in the STEP pin) or at very low stepping speeds, slow decay may not properly regulate current because no back-EMF is present across the motor windings. In this state, motor current can rise very quickly, and requires an excessively large off-time. Increasing/decreasing mixed decay mode allows the current level to stay in regulation when no back-EMF is present across the motor windings.

### 8.3.7 Blanking Time

After the current is enabled in an H-bridge, the current sense comparator is ignored for a period of time ( $t_{\text{BLANK}}$ ) before enabling the current sense circuitry. Note that the blanking time also sets the minimum drive time of the PWM. [Table 7](#) shows the blanking time based on the sine table index and the torque DAC setting. Please note that the torque DAC index is not the same as one step as given in [Table 3](#).

**Table 7. Adaptive Blanking Time over Torque DAC and Microsteps**

| SINE INDEX | TORQUE DAC (TRQ) |       |       |
|------------|------------------|-------|-------|
|            | 100%             | 75%   | 50%   |
| 16         | 100%             | 75%   | 50%   |
| 15         | 98%              | 73.5  | 49%   |
| 14         | 96%              | 72%   | 48%   |
| 13         | 92%              | 69%   | 46%   |
| 12         | 88%              | 66%   | 44%   |
| 11         | 83%              | 62.3% | 41.5% |
| 10         | 77%              | 57.8% | 38.5% |
| 9          | 71%              | 53.3% | 35.5% |
| 8          | 63%              | 47.3% | 31.5% |
| 7          | 56%              | 42%   | 28%   |
| 6          | 47%              | 35.3  | 23.5% |
| 5          | 38%              | 28.5  | 19%   |
| 4          | 29%              | 21.8% | 14.5% |
| 3          | 20%              | 15%   | 10%   |
| 2          | 10%              | 7.5%  | 5%    |
| 1          | 0%               | 0%    | 0%    |

### 8.3.8 Charge Pump

A charge pump is integrated in order to supply a high-side NMOS gate drive voltage. The charge pump requires a capacitor between the VM and VCP pins. Additionally a low ESR ceramic capacitor is required between pins CPH and CPL.

Copyright © 2016, Texas Instruments Incorporated

**Figure 21. Charge Pump Diagram**

### 8.3.9 LDO Voltage Regulator

An LDO regulator is integrated into the DRV8885. DVDD can be used to provide a reference voltage. For proper operation, bypass DVDD to GND using a ceramic capacitor.

The DVDD output is nominally 3.3 V. When the DVDD LDO current load exceeds 1 mA, the output voltage will drop significantly.

The AVDD pin also requires a bypass capacitor to GND. This LDO is for DRV8885 internal use only.

Copyright © 2016, Texas Instruments Incorporated

**Figure 22. LDO Diagram**

If a digital input needs to be tied permanently high (that is, Mx, DECAY or TRQ), it is preferable to tie the input to DVDD instead of an external regulator. This will save power when VM is not applied or in sleep mode: DVDD is disabled and current will not be flowing through the input pulldown resistors. For reference, logic level inputs have a typical pulldown of 100 kΩ, and tri-level inputs have a typical pulldown of 60 kΩ.

### 8.3.10 Logic and Multi-Level Pin Diagrams

Figure 23 gives the input structure for logic-level pins STEP, DIR, ENABLE, nSLEEP, M1:

**Figure 23. Logic-level Input Pin Diagram**

Tri-level logic pins M0 and TRQ have the following structure:

**Figure 24. Tri-level Input Pin Diagram**

Quad-level logic pin DECAY has the following structure:

**Figure 25. Quad-level Input Pin Diagram**

### 8.3.11 Protection Circuits

The DRV8885 is fully protected against undervoltage, charge pump undervoltage, overcurrent, and overtemperature events.

#### 8.3.11.1 VM Undervoltage Lockout (UVLO)

If at any time the voltage on the VM pin falls below the VM undervoltage lockout threshold voltage ( $V_{UVLO}$ ), all FETs in the H-bridge will be disabled, the charge pump will be disabled, the logic will be reset, the DVDD regulator is disabled, and the nFAULT pin will be driven low. Operation will resume when VM rises above the UVLO threshold. The nFAULT pin will be released after operation has resumed. Decreasing VM below this undervoltage threshold will reset the indexer position.

#### 8.3.11.2 VCP Undervoltage Lockout (CPUV)

If at any time the voltage on the VCP pin falls below the charge pump undervoltage lockout threshold voltage, all FETs in the H-bridge will be disabled and the nFAULT pin will be driven low. Operation will resume when VCP rises above the CPUV threshold. The nFAULT pin will be released after operation has resumed.

#### 8.3.11.3 Overcurrent Protection (OCP)

An analog current limit circuit on each FET limits the current through the FET by removing the gate drive. If this analog current limit persists for longer than  $t_{OCP}$ , all FETs in the H-bridge will be disabled and nFAULT will be driven low.

The driver will be re-enabled after the OCP retry period ( $t_{RETRY}$ ) has passed. nFAULT becomes high again at after the retry time. If the fault condition is still present, the cycle repeats. If the fault is no longer present, normal operation resumes and nFAULT remains deasserted.

#### 8.3.11.4 Thermal Shutdown (TSD)

If the die temperature exceeds safe limits, all FETs in the H-bridge will be disabled and the nFAULT pin will be driven low. Once the die temperature has fallen to a safe level operation will automatically resume. The nFAULT pin will be released after operation has resumed.

**Table 8. Fault Condition Summary**

| FAULT                   | CONDITION                            | ERROR REPORT | H-BRIDGE | CHARGE PUMP | INDEXER   | DVDD      | RECOVERY                                           |

## 8.4 Device Functional Modes

The DRV8885 is active unless the nSLEEP pin is brought logic low. In sleep mode the charge pump is disabled, the H-bridge FETs are disabled Hi-Z, and the V3P3 regulator is disabled. Note that  $t_{SLEEP}$  must elapse after a falling edge on the nSLEEP pin before the device is in sleep mode. The DRV8885 is brought out of sleep mode automatically if nSLEEP is brought logic high. Note that  $t_{WAKE}$  must elapse before the outputs change state after wake-up.

TI recommends to keep the STEP pin logic low when coming out of nSLEEP or when applying power.

If the ENABLE pin is brought logic low, the H-bridge outputs are disabled, but the internal logic will still be active. A rising edge on STEP will advance the indexer, but the outputs will not change state until ENABLE is asserted.

**Table 9. Functional Modes Summary**

| CONDITION         |                                                     | H-BRIDGE  | CHARGE PUMP | INDEXER   | V3P3      |

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The DRV8885 is used in bipolar stepper control.

### 9.2 Typical Application

The following design procedure can be used to configure the DRV8885.

**Figure 26. Typical Application Schematic**

#### 9.2.1 Design Requirements

Table 10 gives design input parameters for system design.

**Table 10. Design Parameters**

| DESIGN PARAMETER           | REFERENCE              | EXAMPLE VALUE       |
|----------------------------|------------------------|---------------------|
| Supply voltage             | VM                     | 24 V                |
| Motor winding resistance   | $R_L$                  | 2.6 $\Omega$ /phase |
| Motor winding inductance   | $L_L$                  | 1.4 mH/phase        |
| Motor full step angle      | $\theta_{\text{step}}$ | 1.8°/step           |
| Target microstepping level | $n_m$                  | 1/8 step            |
| Target motor speed         | v                      | 120 rpm             |
| Target full-scale current  | $I_{FS}$               | 1.0 A               |

## 9.2.2 Detailed Design Procedure

### 9.2.2.1 Stepper Motor Speed

The first step in configuring the DRV8885 requires the desired motor speed and microstepping level. If the target application requires a constant speed, then a square wave with frequency  $f_{\text{step}}$  must be applied to the STEP pin.

If the target motor speed is too high, the motor will not spin. Make sure that the motor can support the target speed.

For a desired motor speed ( $v$ ), microstepping level ( $n_m$ ), and motor full step angle ( $\theta_{\text{step}}$ ),

$$f_{\text{step}} \text{ (steps / s)} = \frac{v \text{ (rpm)} \times 360 \text{ (}^\circ \text{ / rot)}}{\theta_{\text{step}} \text{ (}^\circ \text{ / step)} \times n_m \text{ (steps / microstep)} \times 60 \text{ (s / min)}} \quad (3)$$

$\theta_{\text{step}}$  can be found in the stepper motor data sheet, or written on the motor itself.

For the DRV8885, the microstepping level is set by the Mx pins and can be any of the settings in the table below. Higher microstepping will mean a smoother motor motion and less audible noise, but will increase switching losses and require a higher  $f_{\text{step}}$  to achieve the same motor speed.

**Table 11. Microstepping Indexer Settings**

| M1 | M0 | STEP MODE                                       |
|----|----|-------------------------------------------------|
| 0  | 0  | Full step (2-phase excitation) with 71% current |
| 0  | 1  | 1/16 step                                       |
| 1  | 0  | 1/2 step                                        |
| 1  | 1  | 1/4 step                                        |
| 0  | Z  | 1/8 step                                        |
| 1  | Z  | Non-circular 1/2 step                           |

**Example:** Target 120 rpm at 1/8 microstep mode. The motor is 1.8°/step

$$f_{\text{step}} \text{ (steps / s)} = \frac{120 \text{ rpm} \times 360^\circ \text{ / rot}}{1.8^\circ \text{ / step} \times 1/8 \text{ steps / microstep} \times 60 \text{ s / min}} = 3.2 \text{ kHz} \quad (4)$$

### 9.2.2.2 Current Regulation

In a stepper motor, the full-scale current ( $I_{\text{FS}}$ ) is the maximum current driven through either winding. This quantity will depend on the RREF resistor and the TRQ setting. During stepping,  $I_{\text{FS}}$  defines the current chopping threshold ( $I_{\text{TRIP}}$ ) for the maximum current step.

$$I_{\text{FS}} \text{ (A)} = \frac{A_{\text{RREF}} \text{ (k}\Omega\text{)}}{R_{\text{REF}} \text{ (k}\Omega\text{)}} = \frac{30 \text{ (k}\Omega\text{)} \times \text{TRQ}\%}{R_{\text{REF}} \text{ (k}\Omega\text{)}} \quad (5)$$

Note that  $I_{\text{FS}}$  must also follow [Equation 6](#) in order to avoid saturating the motor. VM is the motor supply voltage, and  $R_L$  is the motor winding resistance.

$$I_{\text{FS}} \text{ (A)} < \frac{VM \text{ (V)}}{R_L \text{ (}\Omega\text{)} + 2 \times R_{\text{DS(ON)}} \text{ (}\Omega\text{)}} \quad (6)$$

### 9.2.2.3 Decay Modes

The DRV8885 supports three different decay modes: slow decay, slow/mixed and all mixed decay. The current through the motor windings is regulated using an adjustable fixed-time-off scheme. This means that after any drive phase, when a motor winding current has hit the current chopping threshold ( $I_{\text{TRIP}}$ ), the DRV8885 will place the winding in one of the three decay modes for  $t_{\text{OFF}}$ . After  $t_{\text{OFF}}$ , a new drive phase starts.

The blanking time  $t_{\text{BLANK}}$  defines the minimum drive time for the PWM current chopping.  $I_{\text{TRIP}}$  is ignored during  $t_{\text{BLANK}}$ , so the winding current may overshoot the trip level.

## 9.2.3 Application Curves

**Figure 27. Microstepping Using Slow Decay on Increasing and Decreasing Steps; Current Loses Regulation on Falling Steps**

**Figure 28. Microstepping Using Slow Decay on Increasing Steps and Mixed 30% Fast Decay on Decreasing Steps**

**Figure 29. Microstepping Using Mixed 30% Fast Decay on Increasing and Decreasing Steps**

**Figure 30. Microstepping Using Mixed 60% Fast Decay on Increasing and Decreasing Steps**

## 10 Power Supply Recommendations

The DRV8885 is designed to operate from an input voltage supply (VM) range between 8 V and 35 V. A 0.01  $\mu\text{F}$  ceramic capacitor rated for VM must be placed at each VM pin as close to the DRV8885 as possible. In addition, a bulk capacitor must be included on VM.

### 10.1 Bulk Capacitance

Having appropriate local bulk capacitance is an important factor in motor drive system design. It is generally beneficial to have more bulk capacitance, while the disadvantages are increased cost and physical size.

The amount of local capacitance needed depends on a variety of factors, including:

- The highest current required by the motor system
- The power supply's capacitance and ability to source current
- The amount of parasitic inductance between the power supply and motor system
- The acceptable voltage ripple
- The type of motor used (brushed DC, brushless DC, stepper)
- The motor braking method

The inductance between the power supply and motor drive system will limit the rate current can change from the power supply. If the local bulk capacitance is too small, the system will respond to excessive current demands or dumps from the motor with a change in voltage. When adequate bulk capacitance is used, the motor voltage remains stable and high current can be quickly supplied.

The data sheet generally provides a recommended value, but system-level testing is required to determine the appropriate sized bulk capacitor.

The voltage rating for bulk capacitors should be higher than the operating voltage, to provide margin for cases when the motor transfers energy to the supply.

**Figure 31. Example Setup of Motor Drive System With External Power Supply**

## 11 Layout

### 11.1 Layout Guidelines

The VM terminal should be bypassed to GND using a low-ESR ceramic bypass capacitor with a recommended value of  $0.01\ \mu\text{F}$  rated for VM. This capacitor should be placed as close to the VM pin as possible with a thick trace or ground plane connection to the device GND pin.

The VM pin must be bypassed to ground using a bulk capacitor rated for VM. This component may be an electrolytic.

A low-ESR ceramic capacitor must be placed in between the CPL and CPH pins. A value of  $0.022\ \mu\text{F}$  rated for VM is recommended. Place this component as close to the pins as possible.

A low-ESR ceramic capacitor must be placed in between the VM and VCP pins. A value of  $0.22\ \mu\text{F}$  rated for 16 V is recommended. Place this component as close to the pins as possible.

Bypass AVDD and DVDD to ground with a ceramic capacitor rated 6.3 V. Place this bypassing capacitor as close to the pin as possible.

### 11.2 Layout Example

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

4210249/B

4219075/A 11/2014

## NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

# EXAMPLE BOARD LAYOUT

RHR0028A

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

LAND PATTERN EXAMPLE  
SCALE:15X

SOLDER MASK DETAILS

4219075/A 11/2014

NOTES: (continued)

- This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/sluea271](http://www.ti.com/lit/sluea271)).

# EXAMPLE STENCIL DESIGN

RHR0028A

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

**SOLDER PASTE EXAMPLE**  
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD  
75% PRINTED SOLDER COVERAGE BY AREA  
SCALE:20X

4219075/A 11/2014

NOTES: (continued)

5. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
