

# ISO1042-Q1 70V バス障害保護機能付き、フレキシブル・データレート対応の車載用絶縁型 CAN トランシーバ

## 1 特長

- AEC Q100: 車載アプリケーション向け認定済み
- グレード 1: 周囲温度範囲 -40°C ~ 125°C
- 機能安全対応
  - 機能安全準拠のシステム設計に役立つ資料を利用可能
- ISO 11898-2:2016 の物理層規格に適合
- 最大 1Mbps の Classic CAN、最大 5Mbps の FD (フレキシブル・データレート) に対応
- Low ループ遅延: 152ns
- 保護機能
  - DC バス障害保護電圧:  $\pm 70V$
  - バス・ピンの HBM ESD 耐性:  $\pm 16kV$
  - ドライバ優先タイムアウト (TXD DTO)
  - $V_{CC1}$  および  $V_{CC2}$  の低電圧保護機能
- 同相モード電圧範囲:  $\pm 30V$
- 無電源時の理想的なパッシブ動作、高インピーダンスのバス端子
- 高い CMTI: 100kV/ $\mu s$
- $V_{CC1}$  電圧範囲: 1.71V ~ 5.5V
  - CAN コントローラへの 1.8V、2.5V、3.3V、5.0V ロジック・インターフェイスに対応
- $V_{CC2}$  電圧範囲: 4.5V ~ 5.5V
- 堅牢な電磁環境適合性 (EMC)
  - システム・レベルでの ESD、EFT、サージ耐性
  - 低い放射
- 16-SOIC および 8-SOIC パッケージ・オプション
- 産業用バージョンを供給可能: [ISO1042](#)
- 安全関連認証:
  - DIN VDE V 0884-11:2017-01 に 準拠した 7071V<sub>PK</sub> V<sub>IOTM</sub>/1500V<sub>PK</sub> V<sub>IORM</sub> (強化絶縁型 / 基本絶縁型)
  - UL1577 に 準拠した 絶縁耐圧: 5000V<sub>RMS</sub> (1 分間)
  - CQC、TUV、CSA 認定

## 2 アプリケーション

- スタータ / 発電機
- バッテリ管理システム (BMS)
- DC/DC コンバータ
- オンボード・チャージャ (OBC) およびワイヤレス・チャージャ
- インバータおよびモーター制御

## 3 概要

ISO1042-Q1 デバイスは、ISO11898-2 (2016) 規格に準拠したガバナニク絶縁のコントローラ・エリア・ネットワーク (CAN) トランシーバです。ISO1042-Q1 デバイスは、 $\pm 70V$  の DC バス障害保護機能を搭載し、 $\pm 30V$  の同相電圧範囲に対応しています。CAN FD モードで最高 5Mbps のデータレートに対応するため、Classic CAN よりはるかに高速にペイロードを送信できます。耐圧 5000V<sub>RMS</sub> および 1060V<sub>RMS</sub> の動作電圧の二酸化ケイ素 (SiO<sub>2</sub>) 絶縁膜を採用しています。電磁環境適合性が大幅に強化されているため、システム・レベルの ESD、EFT、サージ、放射の規格に準拠できます。絶縁型電源と組み合わせて使用した場合、高電圧に対して保護し、バスからのノイズ電流がローカル・グランドに入り込むことを防止できます。ISO1042-Q1 デバイスは、基本絶縁型と強化絶縁型の両方で供給されます (「[強化絶縁型と基本絶縁型のオプション](#)」を参照)。ISO1042-Q1 デバイスは、-40°C ~ +125°C の広い周囲温度範囲をサポートしています。このデバイスは、SOIC-16 (DW) パッケージと小型の SOIC-8 (DWV) パッケージで供給されます。

### 製品情報

| 部品番号 (1)   | パッケージ     | 本体サイズ (公称)       |
|------------|-----------|------------------|
| ISO1042-Q1 | SOIC (8)  | 5.85mm × 7.50mm  |
|            | SOIC (16) | 10.30mm × 7.50mm |

(1) 利用可能なパッケージについては、このデータシートの末尾にある注文情報を参照してください。

## 6 Specifications

### 6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)<sup>(1) (2)</sup>

|                       |                                                    | MIN  | MAX                                  | UNIT |
|-----------------------|----------------------------------------------------|------|--------------------------------------|------|
| V <sub>CC1</sub>      | Supply voltage, side 1                             | -0.5 | 6                                    | V    |
| V <sub>CC2</sub>      | Supply voltage, side 2                             | -0.5 | 6                                    | V    |
| V <sub>IO</sub>       | Logic input and output voltage range (TXD and RXD) | -0.5 | V <sub>CC1</sub> +0.5 <sup>(3)</sup> | V    |
| I <sub>O</sub>        | Output current on RXD pin                          | -15  | 15                                   | mA   |
| V <sub>BUS</sub>      | Voltage on bus pins (CANH, CANL)                   | -70  | 70                                   | V    |
| V <sub>BUS_DIFF</sub> | Differential voltage on bus pins (CANH-CANL)       | -70  | 70                                   | V    |
| T <sub>J</sub>        | Junction temperature                               | -40  | 150                                  | °C   |
| T <sub>STG</sub>      | Storage temperature                                | -65  | 150                                  | °C   |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values except differential I/O bus voltages are with respect to the local ground terminal (GND1 or GND2) and are peak voltage values.
- (3) Maximum voltage must not exceed 6 V

### 6.2 ESD Ratings

|                    |                                                                                               |                                      | VALUE  | UNIT |
|--------------------|-----------------------------------------------------------------------------------------------|--------------------------------------|--------|------|
| V <sub>(ESD)</sub> | Electrostatic discharge<br>Human body model (HBM), per ANSI/<br>ESDA/JEDEC JS-001             | All pins <sup>(1)</sup>              | ±6000  | V    |
|                    |                                                                                               | CANH and CANL to GND2 <sup>(1)</sup> | ±16000 | V    |
|                    | Electrostatic discharge<br>Charged device model (CDM), per<br>JEDEC specification JESD22-C101 | All pins <sup>(2)</sup>              | ±1500  |      |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Transient Immunity

| PARAMETER          | TEST CONDITIONS                                                            | VALUE                                               | UNIT      |
|--------------------|----------------------------------------------------------------------------|-----------------------------------------------------|-----------|
| V <sub>PULSE</sub> | ISO7637-2 Transients according to GIFT - ICT<br>CAN EMC test specification | Pulse 1; CAN bus terminals (CANH, CANL) to<br>GND2  | -100<br>V |
|                    |                                                                            | Pulse 2; CAN bus terminals (CANH, CANL) to<br>GND2  | 75<br>V   |
|                    |                                                                            | Pulse 3a; CAN bus terminals (CANH, CANL) to<br>GND2 | -150<br>V |
|                    |                                                                            | Pulse 3b; CAN bus terminals (CANH, CANL) to<br>GND2 | 100<br>V  |

### 6.4 Recommended Operating Conditions

|                  |                                                          | MIN  | MAX  | UNIT |
|------------------|----------------------------------------------------------|------|------|------|
| V <sub>CC1</sub> | Supply Voltage, Side 1, 1.8-V operation                  | 1.71 | 1.89 | V    |
|                  | Supply Voltage, Side 1, 2.5-V, 3.3-V and 5.5-V operation | 2.25 | 5.5  | V    |
| V <sub>CC2</sub> | Supply Voltage, Side 2                                   | 4.5  | 5.5  | V    |
| T <sub>A</sub>   | Operating ambient temperature                            | -40  | 125  | °C   |

## 6.5 Thermal Information

- (1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves, ribs, or both on a printed circuit board are used to help increase these specifications.

- (2) ISO1042-Q1 is suitable for *safe electrical insulation* and ISO1042B-Q1 is suitable for *basic electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
- (4) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (5) All pins on each side of the barrier tied together creating a two-pin device.

## 6.9 Safety Limiting Values

Safety limiting<sup>(1)</sup> intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry.

- (1) The maximum safety temperature, T<sub>S</sub>, has the same value as the maximum junction temperature, T<sub>J</sub>, specified for the device. The I<sub>S</sub> and P<sub>S</sub> parameters represent the safety current and safety power respectively. The maximum limits of I<sub>S</sub> and P<sub>S</sub> should not be exceeded. These limits vary with the ambient temperature, T<sub>A</sub>.

The junction-to-air thermal resistance,  $R_{\theta JA}$ , in the table is that of a device installed on a high-K test board for leaded surface-mount packages. Use these equations to calculate the value for each parameter:

$T_J = T_A + R_{\theta JA} \times P$ , where  $P$  is the power dissipated in the device.

$T_{J(max)} = T_S = T_A + R_{\theta JA} \times P_S$ , where  $T_{J(max)}$  is the maximum allowed junction temperature.

$P_S = I_S \times V_I$ , where  $V_I$  is the maximum input voltage.

## 6.10 Electrical Characteristics - DC Specification

Over recommended operating conditions (unless otherwise noted)

## 8 Detailed Description

### 8.1 Overview

The ISO1042-Q1 device is a digitally isolated CAN transceiver that offers  $\pm 70$ -V DC bus fault protection and  $\pm 30$ -V common-mode voltage range. The device supports up to 5-Mbps data rate in CAN FD mode allowing much faster transfer of payload compared to classic CAN. The ISO1042-Q1 device has an isolation withstand voltage of 5000 V<sub>RMS</sub> and is available in basic and reinforced isolation with a surge test voltage of 6 kV<sub>PK</sub> and 10 kV<sub>PK</sub> respectively. The device can operate from 1.8-V, 2.5-V, 3.3-V, and 5-V supplies on side 1 and a 5-V supply on side 2. This supply range is of particular advantage for applications operating in harsh industrial environments because the low voltage on side 1 enables the connection to low-voltage microcontrollers for power conservation, whereas the 5 V on side 2 maintains a high signal-to-noise ratio of the bus signals.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

#### 8.3.1 CAN Bus States

The CAN bus has two states during operation: *dominant* and *recessive*. A dominant bus state, equivalent to logic low, is when the bus is driven differentially by a driver. A recessive bus state is when the bus is biased to a common mode of  $V_{CC} / 2$  through the high-resistance internal input resistors of the receiver, equivalent to a logic high. The host microprocessor of the CAN node uses the TXD pin to drive the bus and receives data from the bus on the RXD pin. See [Figure 8-1](#) and [Figure 8-2](#).

図 8-1. Bus States (Physical Bit Representation)

図 8-2. Simplified Recessive Common Mode Bias and Receiver

### 8.3.2 Digital Inputs and Outputs: TXD (Input) and RXD (Output)

The  $V_{CC1}$  supply for the isolated digital input and output side of the device can be supplied by 1.8-V, 2.5-V, 3.3-V, and 5-V supplies and therefore the digital inputs and outputs are 1.8-V, 2.5-V, 3.3-V, and 5-V compatible.

#### 注

The TXD pin is very weakly internally pulled up to  $V_{CC1}$ . An external pullup resistor should be used to make sure that the TXD pin is biased to recessive (high) level to avoid issues on the bus if the microprocessor does not control the pin and the TXD pin floats. The TXD pullup strength and CAN bit timing require special consideration when the device is used with an open-drain TXD output on the CAN controller of the microprocessor. An adequate external pullup resistor must be used to make sure that the TXD output of the microprocessor maintains adequate bit timing input to the input on the transceiver.

### 8.3.3 Protection Features

#### 8.3.3.1 TXD Dominant Timeout (DTO)

The TXD DTO circuit prevents the transceiver from blocking network communication in the event of a hardware or software failure where the TXD pin is held dominant longer than the timeout period,  $t_{TXD\_DTO}$ . The DTO circuit timer starts on a falling edge on the TXD pin. The DTO circuit disables the CAN bus driver if no rising edge occurs before the timeout period expires, which frees the bus for communication between other nodes on the network. The CAN driver is activated again when a recessive signal occurs on the TXD pin, clearing the TXD

DTO condition. The receiver and RXD pin still reflect activity on the CAN bus, and the bus terminals are biased to the recessive level during a TXD dominant timeout.

图 8-3. Example Timing Diagram for TXD DTO

#### 注

The minimum dominant TXD time ( $t_{TXD\_DTO}$ ) allowed by the TXD DTO circuit limits the minimum possible transmitted data rate of the device. The CAN protocol allows a maximum of eleven successive dominant bits (on TXD) for the worst case, where five successive dominant bits are followed immediately by an error frame. This, along with the  $t_{TXD\_DTO}$  minimum, limits the minimum data rate. Calculate the minimum transmitted data rate with 式 1.

$$\text{Minimum Data Rate} = 11 / t_{TXD\_DTO} \quad (1)$$

#### 8.3.3.2 Thermal Shutdown (TSD)

If the junction temperature of the device exceeds the thermal shutdown threshold ( $T_{TSD}$ ), the device turns off the CAN driver circuits, blocking the TXD-to-bus transmission path. The CAN bus terminals are biased to the recessive level during a thermal shutdown, and the receiver-to-RXD path remains operational. The shutdown condition is cleared when the junction temperature drops at least the thermal shutdown hysteresis temperature ( $T_{TSD\_HYST}$ ) below the thermal shutdown temperature ( $T_{TSD}$ ) of the device.

#### 8.3.3.3 Undervoltage Lockout and Default State

The supply pins have undervoltage detection that places the device in protected or default mode which protects the bus during an undervoltage event on the  $V_{CC1}$  or  $V_{CC2}$  supply pins. If the bus-side power supply,  $V_{CC2}$ , is less than about 4 V, the power shutdown circuits in the ISO1042-Q1 device disable the transceiver to prevent false transmissions because of an unstable supply. If the  $V_{CC1}$  supply is still active when this occurs, the receiver output (RXD) goes to a default HIGH (recessive) value. 表 8-1 summarizes the undervoltage lockout and fail-safe behavior.

表 8-1. Undervoltage Lockout and Default State

| $V_{CC1}$     | $V_{CC2}$     | DEVICE STATE | BUS OUTPUT               | RXD          |
|---------------|---------------|--------------|--------------------------|--------------|
| $> UV_{VCC1}$ | $> UV_{VCC2}$ | Functional   | Per Device State and TXD | Mirrors Bus  |
| $< UV_{VCC1}$ | $> UV_{VCC2}$ | Protected    | Recessive                | Undetermined |

**表 8-1. Undervoltage Lockout and Default State (continued)**

| V <sub>CC1</sub>    | V <sub>CC2</sub>     | DEVICE STATE | BUS OUTPUT     | RXD                      |
|---------------------|----------------------|--------------|----------------|--------------------------|
| >UV <sub>VCC1</sub> | < UV <sub>VCC2</sub> | Protected    | High Impedance | Recessive (Default High) |

注

After an undervoltage condition is cleared and the supplies have returned to valid levels, the device typically resumes normal operation in 300 μs.

### 8.3.3.4 Floating Pins

Pullup and pulldown resistors should be used on critical pins to place the device into known states if the pins float. The TXD pin should be pulled up through a resistor to the V<sub>CC1</sub> pin to force a recessive input level if the microprocessor output to the pin floats.

### 8.3.3.5 Unpowered Device

The device is designed to be *ideal passive* or *no load* to the CAN bus if it is unpowered. The bus pins (CANH, CANL) have extremely low leakage currents when the device is unpowered to avoid loading down the bus which is critical if some nodes of the network are unpowered while the rest of the of network remains in operation.

### 8.3.3.6 CAN Bus Short Circuit Current Limiting

The device has two protection features that limit the short circuit current when a CAN bus line has a short-circuit fault condition. The first protection feature is driver current limiting (both dominant and recessive states) and the second feature is TXD dominant state time out to prevent permanent higher short circuit current of the dominant state during a system fault. During CAN communication the bus switches between dominant and recessive states, therefore the short circuit current may be viewed either as the instantaneous current during each bus state or as an average current of the two states. For system current (power supply) and power considerations in the termination resistors and common-mode choke ratings, use the average short circuit current. Determine the ratio of dominant and recessive bits by the data in the CAN frame plus the following factors of the protocol and PHY that force either recessive or dominant at certain times:

- Control fields with set bits
- Bit stuffing
- Interframe space
- TXD dominant time out (fault case limiting)

These factors ensure a minimum recessive amount of time on the bus even if the data field contains a high percentage of dominant bits. The short circuit current of the bus depends on the ratio of recessive to dominant bits and their respective short circuit currents. Use 式 2 to calculate the average short circuit current.

$$I_{OS(AVG)} = \%Transmit \times [(\%REC\_Bits \times I_{OS(SS)\_REC}) + (\%DOM\_Bits \times I_{OS(SS)\_DOM})] + [\%Receive \times I_{OS(SS)\_REC}] \quad (2)$$

where

- $I_{OS(AVG)}$  is the average short circuit current
- %Transmit is the percentage the node is transmitting CAN messages
- %Receive is the percentage the node is receiving CAN messages
- %REC\_Bits is the percentage of recessive bits in the transmitted CAN messages
- %DOM\_Bits is the percentage of dominant bits in the transmitted CAN messages
- $I_{OS(SS)\_REC}$  is the recessive steady state short circuit current
- $I_{OS(SS)\_DOM}$  is the dominant steady state short circuit current

## 注

Consider the short circuit current and possible fault cases of the network when sizing the power ratings of the termination resistance and other network components.

## 8.4 Device Functional Modes

表 8-2 和 表 8-3 list the driver and receiver functions. 表 8-4 lists the functional modes for the ISO1042-Q1 device.

**表 8-2. Driver Function Table**

| INPUT<br>TXD <sup>(1)</sup> | OUTPUTS             |                     | DRIVEN BUS STATE |
|-----------------------------|---------------------|---------------------|------------------|
|                             | CANH <sup>(1)</sup> | CANL <sup>(1)</sup> |                  |
| L                           | H                   | L                   | Dominant         |
| H                           | Z                   | Z                   | Recessive        |

(1) H = high level, L = low level, Z = common mode (recessive) bias to  $V_{CC} / 2$ . See 图 8-1 and 图 8-2 for bus state and common mode bias information.

**表 8-3. Receiver Function Table**

| DEVICE MODE | CAN DIFFERENTIAL INPUTS<br>$V_{ID} = V_{CANH} - V_{CANL}$ <sup>(3)</sup> | BUS STATE | RXD PIN <sup>(1)</sup> |

(1) H = high level; L = low level; X = irrelevant; ? = indeterminate; Z = high impedance

(2) Logic low pulses to prevent dominant time-out.

(3) See Receiver Electrical Characteristics section for input thresholds.

## 9 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The ISO1042-Q1 device can be used with other components from Texas Instruments such as a microcontroller, a transformer driver, and a linear voltage regulator to form a fully isolated CAN interface.

### 9.2 Typical Application

9-1. Application Circuit With ISO1042-Q1 in 16-SOIC Package

**FIG 9-2. Application Circuit With ISO1042-Q1 in 8-SOIC Package**

### 9.2.1 Design Requirements

Unlike an optocoupler-based solution, which requires several external components to improve performance, provide bias, or limit current, the ISO1042-Q1 device only requires external bypass capacitors to operate.

### 9.2.2 Detailed Design Procedure

#### 9.2.2.1 Bus Loading, Length and Number of Nodes

The ISO 11898-2 Standard specifies a maximum bus length of 40 m and maximum stub length of 0.3 m. However, with careful design, users can have longer cables, longer stub lengths, and many more nodes to a bus. A large number of nodes requires transceivers with high input impedance such as the ISO1042-Q1 transceivers.

Many CAN organizations and standards have scaled the use of CAN for applications outside the original ISO 11898-2 Standard. These organizations and standards have made system-level trade-offs for data rate, cable length, and parasitic loading of the bus. Examples of some of these specifications are ARINC825, CANopen, DeviceNet, and NMEA2000.

The ISO1042-Q1 device is specified to meet the 1.5-V requirement with a 50-Ω load, incorporating the worst case including parallel transceivers. The differential input resistance of the ISO1042-Q1 device is a minimum of 30 kΩ. If 100 ISO1042-Q1 transceivers are in parallel on a bus, this requirement is equivalent to a 300-Ω differential load worst case. That transceiver load of 300 Ω in parallel with the 60 Ω gives an equivalent loading of 50 Ω. Therefore, the ISO1042-Q1 device theoretically supports up to 100 transceivers on a single bus segment. However, for CAN network design margin must be given for signal loss across the system and cabling, parasitic loadings, network imbalances, ground offsets and signal integrity, therefore a practical maximum number of nodes is typically much lower. Bus length may also be extended beyond the original ISO 11898 standard of 40 m by careful system design and data-rate tradeoffs. For example, CANopen network design guidelines allow the network to be up to 1 km with changes in the termination resistance, cabling, less than 64 nodes, and a significantly lowered data rate.

This flexibility in CAN network design is one of the key strengths of the various extensions and additional standards that have been built on the original ISO 11898-2 CAN standard. Using this flexibility requires the responsibility of good network design and balancing these tradeoffs.

#### 9.2.2.2 CAN Termination

The ISO11898 standard specifies the interconnect to be a single twisted pair cable (shielded or unshielded) with 120-Ω characteristic impedance ( $Z_0$ ). Resistors equal to the characteristic impedance of the line should be used

to terminate both ends of the cable to prevent signal reflections. Unterminated drop-lines (stubs) connecting nodes to the bus should be kept as short as possible to minimize signal reflections. The termination may be in a node, but if nodes are removed from the bus, the termination must be carefully placed so that it is not removed from the bus.

FIG 9-3. Typical CAN Bus

Termination may be a single 120-Ω resistor at the end of the bus, either on the cable or in a terminating node. If filtering and stabilization of the common-mode voltage of the bus is desired, then split termination can be used. (See FIG 9-4). Split termination improves the electromagnetic emissions behavior of the network by eliminating fluctuations in the bus common-mode voltages at the start and end of message transmissions.

FIG 9-4. CAN Bus Termination Concepts

### 9.2.3 Application Curve

FIG 9-5. Typical TXD, RXD, CANH and CANL Waveforms at 1 Mbps

## 10 Power Supply Recommendations

To make sure operation is reliable at all data rates and supply voltages, a 0.1- $\mu$ F bypass capacitor is recommended at the input and output supply pins ( $V_{CC1}$  and  $V_{CC2}$ ). The capacitors should be placed as close to the supply pins as possible. In addition, a bulk capacitance, typically 4.7  $\mu$ F, should be placed near the  $V_{CC2}$  supply pin. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as TI's [SN6505B](#). For such applications, detailed power supply design, and transformer selection recommendations are available in the [SN6505 Low-Noise 1-A Transformer Drivers for Isolated Power Supplies data sheet](#).

## 11 Layout

### 11.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see [セクション 11.2](#)). Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/in<sup>2</sup>.
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.

Suggested placement and routing of ISO1042-Q1 bypass capacitors and optional TVS diodes is shown in [図 11-2](#) and [図 11-3](#). In particular, place the  $V_{CC2}$  bypass capacitors on the top layer, as close to the device pins as possible, and complete the connection to the  $V_{CC2}$  and  $G_{ND2}$  pins without using vias. Note that the SOIC-16 variant needs two  $V_{CC2}$  bypass capacitor, one on each  $V_{CC2}$  pin.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

For detailed layout recommendations, refer to the [Digital Isolator Design Guide](#).

#### 11.1.1 PCB Material

For digital circuit boards operating at less than 150 Mbps, (or rise and fall times greater than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit board. This PCB is preferred over lower-cost alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and the self-extinguishing flammability-characteristics.

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm, per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm, per side.
