### 1.3 概要

MSP430F67xx1A多相メータリングSoCは、少ない外付け部品で高精度と低システム・コストを実現する、高度に統合された強力なソリューションです。MSP430F67xx1Aマイクロコントローラ(MCU)ファミリはMSP430™計量・監視MCUに属する製品で、スマート・グリッドやビル・オートメーションなどの電力量測定/電力監視システムに最適です。

MSP430F67xx1A MCUは、最大7つの独立した24ビット・シグマ・デルタADCを搭載し、誤差0.1%未満の高精度を実現しています。MSP430F67xx1Aは32ビット乗算器を搭載した高性能MSP430 CPUにより、あらゆる計量計算を実行できます。このファミリの製品は最大512KBのフラッシュ、32KBのRAM、最大320セグメントに対応するLCDコントローラを内蔵しています。

超低消費電力のMSP430F67xx1Aでは、システム消費電力を最小限に抑えて全体的なコストを削減できます。また、スタンバイ時の消費電力が極めて低いいため、バックアップ用電源容量を最小限に抑えることができ、主電源障害時にも長時間にわたって重要なデータを保持できます。

MSP430F67xx1A MCUファミリは、ソフトウェアおよびハードウェアの大規模なエコシステムによってサポートされています。テキサス・インスツルメンツのエネルギー測定デザイン・センター(EMDC)では、エネルギー測定ソフトウェア・ライブラリを素早く構成し、コードを自動的に生成して、校正を行い、結果を確認できるため、簡単に開発し、短時間で設計できます。MSP430F67xx1A MCUでは、エネルギー測定ソフトウェア・ライブラリを実行して、関連するすべての電力量/電力の結果を計算します。開発キットには、EVM430-F6779 3相電力量計評価モジュールとMSP-TS430PEU128 128ピン・ターゲット開発ボードがあります。業界標準の開発ツールとハードウェア・プラットフォームを利用して、すべてのANSI/IEC規格に適合したメータを世界中で短期間に開発できます。

モジュールの完全な説明については、『MSP430FR5xxおよびMSP430FR6xxファミリ ユーザー・ガイド』を参照してください。

- (3) Each number in the sequence represents an instantiation of Timer\_A with its associated number of capture/compare registers and PWM output generators available. For example, a number sequence of 3, 5 would represent two instantiations of Timer\_A, the first instantiation having 3 and the second instantiation having 5 capture/compare registers and PWM output generators, respectively.

## 4 Terminal Configuration and Functions

### 4.1 Pin Diagrams

Figure 4-1 shows the pinout for the 128-pin PEU package. Table 4-1 summarizes the differences in the pinout among the device variants.

- The secondary digital functions on Ports P2, P3, and P4 are fully mappable. This pinout shows only the default mapping. See Section 6.11.6 for details.
- The pair of pins VDSYS1 and VDSYS2, VASYS1 and VASYS2 must be connected externally on board for proper device operation.
- CAUTION:** The LCDCAP/R33 pin must be connected to DVSS if it is not used.

### 4.3 Pin Multiplexing

Pin multiplexing for these devices is controlled by both register settings and operating modes (for example, if the device is in test mode). For details of the settings for each pin and schematics of the multiplexed ports, see [Section 6.12](#).

### 4.4 Connection of Unused Pins

[Table 4-5](#) lists the correct termination of unused pins.

**Table 4-5. Connection of Unused Pins<sup>(1)</sup>**

| PIN  | POTENTIAL                           | COMMENT   |
|--|-------------------------------------|---|
| AVCC   | DV <sub>CC</sub>                    |   |
| AVSS   | DV <sub>SS</sub>                    |   |
| Px.y   | Open                                | Switched to port function, output direction (PxDIR.n = 1). Px.y represents port x and bit y of port x (for example, P1.0, P1.1, P2.2, PJ.0, PJ.1)   |
| XIN  | DV <sub>SS</sub>                    | For dedicated XIN pins only. XIN pins with shared GPIO functions should be programmed to GPIO and follow Px.y recommendations.  |
| XOUT   | Open                                | For dedicated XOUT pins only. XOUT pins with shared GPIO functions should be programmed to GPIO and follow Px.y recommendations.  |

| $\overline{\text{RST}}$ /NMI                 | DV <sub>CC</sub> or V <sub>CC</sub> | 47-k $\Omega$ pullup or internal pullup selected with 10-nF (2.2 nF) pulldown <sup>(2)</sup>  |
| PJ.0/TDO<br>PJ.1/TDI<br>PJ.2/TMS<br>PJ.3/TCK | Open                                | The JTAG pins are shared with general-purpose I/O function (PJ.x). If not being used, these should be switched to port function, output direction (PJDIR.n = 1). When used as JTAG pins, these pins should remain open. |
| TEST   | Open                                | This pin always has an internal pulldown enabled.   |

- (1) Any unused pin with a secondary function that is shared with general-purpose I/O should follow the Px.y unused pin connection guidelines.
- (2) The pulldown capacitor should not exceed 2.2 nF when using devices with Spy-Bi-Wire interface in Spy-Bi-Wire mode or in 4-wire JTAG mode with TI tools such as FET interfaces or GANG programmers.

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages referenced to  $V_{SS} = V_{DVSS} = V_{AVSS}$ .
- (3) V<sub>CORE</sub> is for internal device use only. No external DC loading or voltage should be applied.
- (4) See [Table 5-39](#) for SD24\_B specifications.
- (5) See [Table 5-18](#) for AUX specifications.
- (6) A protection diode is connected to  $V_{CC}$  for the SD24\_B input pins. No protection diode is connected to  $V_{SS}$ .
- (7) Higher temperature may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

### 5.2 ESD Ratings

|  |  | VALUE | UNIT |
|--|--|-------|------|
| V <sub>(ESD)</sub> Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>              | ±1000 | V    |
|  | Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup> | ±250  |      |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±1000 V may actually have higher performance.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as ±250 V may actually have higher performance.

| T <sub>J</sub>                            | Operating junction temperature   | I version              | -40 | 85  | °C   |
| C <sub>VCORE</sub>                        | Recommended capacitor at V <sub>CORE</sub>   |                        | 470 |     | nF   |

- (3) The MSP430 CPU is clocked directly with MCLK. Both the high and low phase of MCLK must not exceed the pulse duration of the specified maximum frequency.
- (4) Modules may have a different maximum input clock specification. See the specification of the respective module in this data sheet.

The numbers within the fields denote the supported PMMCOREVx settings.

- (1) To improve EMI on the XT1 oscillator, the following guidelines should be observed.
  - Keep the trace between the device and the crystal as short as possible.
  - Design a good ground plane around the oscillator pins.
  - Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
  - Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
  - Use assembly materials and processes that avoid any parasitic load on the oscillator XIN and XOUT pins.
  - If conformal coating is used, make sure that it does not induce capacitive or resistive leakage between the oscillator pins.
- (2) When XT1BYPASS is set, XT1 circuits are automatically powered down. Input signal is a digital square wave with parametrics defined in the Schmitt-trigger Inputs section of this data sheet.
- (3) Maximum frequency of operation of the entire device cannot be exceeded.
- (4) Oscillation allowance is based on a safety factor of 5 for recommended crystals. The oscillation allowance is a function of the XT1DRIVE<sub>x</sub> settings and the effective load. In general, comparable oscillator allowance can be achieved based on the following guidelines, but should be evaluated based on the actual crystal selected for the application:
  - For XT1DRIVE<sub>x</sub> = 0, C<sub>L,eff</sub> ≤ 6 pF.
  - For XT1DRIVE<sub>x</sub> = 1, 6 pF ≤ C<sub>L,eff</sub> ≤ 9 pF.
  - For XT1DRIVE<sub>x</sub> = 2, 6 pF ≤ C<sub>L,eff</sub> ≤ 10 pF.
  - For XT1DRIVE<sub>x</sub> = 3, C<sub>L,eff</sub> ≥ 6 pF.
- (5) Includes parasitic bond and package capacitance (approximately 2 pF per pin). Because the PCB adds additional capacitance, verify the correct load by measuring the ACLK frequency. For a correct setup, the effective load capacitance should always match the specification of the used crystal.
- (6) Requires external capacitors at both terminals. Values are specified by crystal manufacturers.
- (7) Frequencies below the MIN specification set the fault flag. Frequencies above the MAX specification do not set the fault flag. Frequencies in between might set the flag.
- (8) Measured with logic-level input frequency but also applies to operation with crystals.

(1) When selecting the proper DCO frequency range (DCORSELx), the target DCO frequency,  $f_{DCO}$ , should be set to reside within the range of  $f_{DCO(n,0),MAX} \leq f_{DCO} \leq f_{DCO(n,31),MIN}$ , where  $f_{DCO(n,0),MAX}$  represents the maximum frequency specified for the DCO frequency, range n, tap 0 (DCOx = 0) and  $f_{DCO(n,31),MIN}$  represents the minimum frequency specified for the DCO frequency, range n, tap 31 (DCOx = 31). This ensures that the target DCO frequency resides within the range selected. It should also be noted that if the actual  $f_{DCO}$  frequency for the selected range causes the FLL or the application to select tap 0 or 31, the DCO fault flag is set to report that the selected range is at its minimum or maximum tap setting.

- (1) The full-scale range (FSR) is defined by  $V_{FS+} = +V_{REF}/GAIN$  and  $V_{FS-} = -V_{REF}/GAIN$ ;  $FSR = V_{FS+} - V_{FS-} = 2 \times V_{REF}/GAIN$ . If  $V_{REF}$  is sourced externally, the analog input range should not exceed 80% of  $V_{FS+}$  or  $V_{FS-}$ , that is,  $V_{ID} = 0.8 V_{FS-}$  to  $0.8 V_{FS+}$ . If  $V_{REF}$  is sourced internally, the given  $V_{ID}$  ranges apply. MIN values are calculated based on a  $V_{REF}$  of 1.125 V. TYP values are calculated based on a  $V_{REF}$  of 1.16 V.
- (2) There is no capacitance required on VREF. However, TI recommends using a capacitance of 100 nF to reduce any reference voltage noise.

- The gain error E<sub>G</sub> specifies the deviation of the actual gain G<sub>act</sub> from the nominal gain G<sub>nom</sub>:  $E_G = (G_{act} - G_{nom})/G_{nom}$ . It covers process, temperature, and supply voltage variations.
- The gain error temperature coefficient ΔE<sub>G</sub>/ΔT specifies the variation of the gain error E<sub>G</sub> over temperature ( $E_G(T) = (G_{act}(T) - G_{nom})/G_{nom}$ ) using the box method (that is, minimum and maximum values):  
 $\Delta E_G / \Delta T = (\text{MAX}(E_G(T)) - \text{MIN}(E_G(T))) / (\text{MAX}(T) - \text{MIN}(T)) = (\text{MAX}(G_{act}(T)) - \text{MIN}(G_{act}(T))) / G_{nom} / (\text{MAX}(T) - \text{MIN}(T))$   
with T ranging from -40°C to 85°C.
- The gain error vs V<sub>CC</sub> coefficient ΔE<sub>G</sub>/ΔV<sub>CC</sub> specifies the variation of the gain error E<sub>G</sub> over supply voltage ( $E_G(V_{CC}) = (G_{act}(V_{CC}) - G_{nom})/G_{nom}$ ) using the box method (that is, minimum and maximum values):

with V<sub>CC</sub> ranging from 2.4 V to 3.6 V.
- The offset error E<sub>OS</sub> is measured with shorted inputs in 2s-complement mode with +100% FS = V<sub>REF</sub>/G and -100% FS = -V<sub>REF</sub>/G. Conversion between E<sub>OS</sub> [FS] and E<sub>OS</sub> [V] is as follows: E<sub>OS</sub> [FS] = E<sub>OS</sub> [V] × G/V<sub>REF</sub>, E<sub>OS</sub> [V] = E<sub>OS</sub> [FS] × V<sub>REF</sub>/G.
- The offset error temperature coefficient ΔE<sub>OS</sub>/ΔT specifies the variation of the offset error E<sub>OS</sub> over temperature using the box method (that is, minimum and maximum values):  
 $\Delta E_{OS} / \Delta T = (\text{MAX}(E_{OS}(T)) - \text{MIN}(E_{OS}(T))) / (\text{MAX}(T) - \text{MIN}(T))$

- (6) The offset error vs V<sub>CC</sub>  $\Delta E_{OS}/\Delta V_{CC}$  specifies the variation of the offset error E<sub>OS</sub> over supply voltage using the box method (that is, minimum and maximum values):  

$$\Delta E_{OS}/\Delta V_{CC} = (\text{MAX}(E_{OS}(V_{CC})) - \text{MIN}(E_{OS}(V_{CC})) / (\text{MAX}(V_{CC}) - \text{MIN}(V_{CC}))$$
with V<sub>CC</sub> ranging from 2.4 V to 3.6 V.
- (7) The DC CMRR specifies the change in the measured differential input voltage value when the common-mode voltage varies:  
DC CMRR =  $-20\log(\Delta_{MAX}/FSR)$  with  $\Delta_{MAX}$  being the difference between the minimum value and the maximum value measured when sweeping the common-mode voltage.  
The DC CMRR is measured with both inputs connected to the common-mode voltage (that is, no differential input signal is applied), and the common-mode voltage is swept from -1 V to V<sub>CC</sub>.
- (8) The AC CMRR is the difference between a hypothetical signal with the amplitude and frequency of the applied common-mode ripple applied to the inputs of the ADC and the actual common-mode signal spur visible in the FFT spectrum:  
AC CMRR = Error Spur [dBFS] -  $20\log(V_{CM} / 1.2 \text{ V} / G)$  [dBFS] with a common-mode signal of  $V_{CM} \times \sin(2\pi \times f_{CM} \times t)$  applied to the analog inputs.  
The AC CMRR is measured with the both inputs connected to the common-mode signal; that is, no differential input signal is applied. With the specified typical values the error spur is within the noise floor (as specified by the SINAD values).
- (9) The AC PSRR is the difference between a hypothetical signal with the amplitude and frequency of the applied supply voltage ripple applied to the inputs of the ADC and the actual supply ripple spur visible in the FFT spectrum:  
AC PSRR = Error Spur [dBFS] -  $20\log(50 \text{ mV} / 1.2 \text{ V} / G)$  [dBFS] with a signal of  $50 \text{ mV} \times \sin(2\pi \times f_{VCC} \times t)$  added to V<sub>CC</sub>.  
The AC PSRR is measured with the inputs grounded; that is, no analog input signal is applied. With the specified typical values the error spur is within the noise floor (as specified by the SINAD values).  
SD24GAIN: 1 → Hypothetical signal:  $20\log(50 \text{ mV} / 1.2 \text{ V} / 1) = -27.6 \text{ dBFS}$   
SD24GAIN: 8 → Hypothetical signal:  $20\log(50 \text{ mV} / 1.2 \text{ V} / 8) = -9.5 \text{ dBFS}$   
SD24GAIN: 32 → Hypothetical signal:  $20\log(50 \text{ mV} / 1.2 \text{ V} / 32) = 2.5 \text{ dBFS}$
- (10) The crosstalk XT is specified as the tone level of the signal applied to the crosstalk source seen in the spectrum of the converter under test. It is measured with the inputs of the converter under test being grounded.

(1) The analog input voltage range must be within the selected reference voltage range V<sub>R+</sub> to V<sub>R-</sub> for valid conversion results. The external reference voltage requires decoupling capacitors. Connect two decoupling capacitors, 10 μF and 100 nF, to VREF to decouple the dynamic current required for an external reference source if it is used for the ADC10\_A. - (1) The external reference is used during ADC conversion to charge and discharge the capacitance array. The input capacitance, C<sub>I</sub>, is also the dynamic load for an external reference during conversion. The dynamic impedance of the reference supply should follow the recommendations on analog-source impedance to allow the charge to settle for 10-bit accuracy.
- (2) The accuracy limits the minimum positive external reference voltage. Lower reference voltage levels may be applied with reduced accuracy requirements.
- (3) The accuracy limits the maximum negative external reference voltage. Higher reference voltage levels may be applied with reduced accuracy requirements.

(1) The internal reference current is supplied from the AV<sub>CC</sub> terminal. Consumption is independent of the ADC10ON control bit, unless a conversion is active. The REFON bit enables to settle the built-in reference before starting an analog-to-digital conversion.

(2) Calculated using the box method: (MAX(−40°C to 85°C) – MIN(−40°C to 85°C)) / MIN(−40°C to 85°C)/(85°C – (−40°C)).

(3) The sensor current I<sub>SENSOR</sub> is consumed if (ADC10ON = 1 and REFON = 1) or (ADC10ON = 1 and INCH = 0Ah and sample signal is high). When REFON = 1, I<sub>SENSOR</sub> is already included in I<sub>REF+</sub>.

(4) The temperature sensor offset can be significant. TI recommends a single-point calibration to minimize the offset error of the built-in temperature sensor.

(5) The typical equivalent impedance of the sensor is 51 kΩ. The sample time required includes the sensor-on time t<sub>SENSOR(on)</sub>.

(6) The on-time t<sub>VMID(on)</sub> is included in the sampling time t<sub>VMID(sample)</sub>; no additional on time is needed.

(7) The condition is that the error in a conversion started after t<sub>REFON</sub> is less than ±0.5 LSB.

## 6 Detailed Description

### 6.1 Overview

The TI MSP430F67xx1A family of polyphase metering SoCs are powerful highly-integrated solutions for revenue meters that offer accuracy and low system cost with few external components. The MSP430F67xx1A uses the low-power MSP430 CPU with a 32-bit multiplier to perform all energy calculations, metering applications such as tariff rate management, and communications with AMR and AMI modules.

### 6.3 CPU ([Link to User's Guide](#))

The MSP430 CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock. Four of the registers, R0 to R3, are dedicated as program counter, stack pointer, status register, and constant generator, respectively. The remaining registers are general-purpose registers (see [Figure 6-3](#)).

Peripherals are connected to the CPU using data, address, and control buses. Peripherals can be managed with all instructions.

## 6.4 Instruction Set

The instruction set consists of the original 51 instructions with three formats and seven address modes and additional instructions for the expanded address range. Each instruction can operate on word and byte data. [Table 6-1](#) lists examples of the three types of instruction formats. [Table 6-2](#) lists the address modes.

**Table 6-1. Instruction Word Formats**

| INSTRUCTION WORD FORMAT                     | EXAMPLE   | OPERATION             |
|---|-----------|-----------------------|

(1) Multiple source flags

(2) A reset is generated if the CPU tries to fetch instructions from within peripheral space or vacant memory space.

(3) (Non)maskable: the individual interrupt enable bit can disable an interrupt event, but the general interrupt enable bit cannot disable it.

(4) Interrupt flags are in the module.

(5) Reserved interrupt vectors at addresses are not used in this device and can be used for regular program code if necessary. To maintain compatibility with other devices, TI recommends reserving these locations.

## 6.7 Special Function Registers (SFRs)

The SFRs are in the lowest address space and can be accessed in word or byte formats.

## 6.8 Bootloader (BSL)

The BSL enables users to program the flash memory or RAM using various serial interfaces. Table 6-6 lists the BSL interface pin requirements. Access to the device memory by the BSL is protected by a user-defined password. BSL entry requires a specific entry sequence on the  $\overline{\text{RST}}/\text{NMI}/\text{SBWTDIO}$  and  $\text{TEST}/\text{SBWTCK}$  pins. For a complete description of the features of the BSL and its implementation, see the *MSP430™ Flash Device Bootloader (BSL) User's Guide*.

| DEVICE SIGNAL                                     | BSL FUNCTION          |
|---|-----------------------|
| $\overline{\text{RST}}/\text{NMI}/\text{SBWTDIO}$ | Entry sequence signal |
| $\text{TEST}/\text{SBWTCK}$                       | Entry sequence signal |

## 6.9 JTAG Operation

### 6.9.1 JTAG Standard Interface

The MSP430 family supports the standard JTAG interface which requires four signals for sending and receiving data. The JTAG signals are shared with general-purpose I/O. The TEST/SBWTCK pin is used to enable the JTAG signals. In addition to these signals, the  $\overline{\text{RST}}/\text{NMI}/\text{SBWTDIO}$  is required to interface with MSP430 development tools and device programmers. [Table 6-7](#) lists the JTAG interface pin requirements. For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#). For a complete description of the features of the JTAG interface and its implementation, see [MSP430 Programming With the JTAG Interface](#).

**Table 6-7. JTAG Pin Requirements and Functions**

| DEVICE SIGNAL                                     | DIRECTION | FUNCTION                    |

### 6.9.2 Spy-Bi-Wire Interface

In addition to the standard JTAG interface, the MSP430 family supports the 2-wire Spy-Bi-Wire interface. Spy-Bi-Wire can be used to interface with MSP430 development tools and device programmers. [Table 6-8](#) lists the Spy-Bi-Wire interface pin requirements. For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#). For a complete description of the features of the JTAG interface and its implementation, see [MSP430 Programming With the JTAG Interface](#).

### 6.10.2 Flash Memory ([Link to User's Guide](#))

The flash memory can be programmed through the JTAG port, Spy-Bi-Wire (SBW), the BSL, or in-system by the CPU. The CPU can perform single-byte, single-word, and long-word writes to the flash memory. Features of the flash memory include:

- Flash memory has n segments of main memory and four segments of information memory (A to D) of 128 bytes each. Each segment in main memory is 512 bytes in size.
- Segments 0 to n may be erased in one step, or each segment may be individually erased.
- Segments A to D can be erased individually, or as a group with segments 0 to n. Segments A to D are also called *information memory*.
- Segment A can be locked separately.

### 6.10.3 RAM ([Link to User's Guide](#))

The RAM is made up of n sectors. Each sector can be completely powered down to save leakage; however, all data are lost in the sector that is powered down. Features of the RAM include:

- RAM has n sectors of 4KB each.
- Each sector 0 to n can be completely disabled; however, data retention is lost in the disabled sector.
- Each sector 0 to n automatically enters low-power retention mode when possible.

### 6.10.4 Backup RAM ([Link to User's Guide](#))

The backup RAM provides a limited number of bytes of RAM that are retained during LPM3.5. This backup RAM is part of the backup subsystem that operates on dedicated power supply AUXVCC3. Eight bytes of backup RAM are available in this device. The backup RAM can be word-wise accessed using the registers BAKMEM0, BAKMEM1, BAKMEM2, and BAKMEM3. The backup RAM registers cannot be accessed by CPU when the high-side SVS is disabled by the user application.

## 6.11 Peripherals

Peripherals are connected to the CPU through data, address, and control buses. Peripherals can be controlled using all instructions. For complete module descriptions, see the [MSP430x5xx and MSP430x6xx Family User's Guide](#).

### 6.11.1 Oscillator and System Clock ([Link to User's Guide](#))

The Unified Clock System (UCS) module includes support for a 32768-Hz watch crystal oscillator, an internal very-low-power low-frequency oscillator (VLO), an internal trimmed low-frequency oscillator (REFO), and an integrated internal digitally controlled oscillator (DCO). The UCS module is designed to meet the requirements of both low system cost and low power consumption. The UCS module features digital frequency-locked loop (FLL) hardware that, in conjunction with a digital modulator, stabilizes the DCO frequency to a programmable multiple of the selected FLL reference frequency. The internal DCO provides a fast turnon clock source and stabilizes in less than 5  $\mu$ s. The UCS module provides the following clock signals:

- Auxiliary clock (ACLK), sourced from a 32768-Hz watch crystal, the internal low-frequency oscillator (VLO), or the trimmed low-frequency oscillator (REFO).
- Main clock (MCLK), the system clock used by the CPU. MCLK can be sourced by same sources made available to ACLK.
- Sub-Main clock (SMCLK), the subsystem clock used by the peripheral modules. SMCLK can be sourced by same sources made available to ACLK.
- ACLK/n, the buffered output of ACLK, ACLK/2, ACLK/4, ACLK/8, ACLK/16, ACLK/32.

### 6.11.2 Power-Management Module (PMM) ([Link to User's Guide](#))

The PMM includes an integrated voltage regulator that supplies the core voltage to the device and contains programmable output levels to provide for power optimization. The PMM also includes supply voltage supervisor (SVS) and supply voltage monitoring (SVM) circuitry, as well as brownout protection. The brownout circuit is implemented to provide the proper internal reset signal to the device during power on and power off. The SVS and SVM circuitry detects if the supply voltage drops below a user-selectable level and supports both supply voltage supervision (the device is automatically reset) and supply voltage monitoring (the device is not automatically reset). SVS and SVM circuitry is available on the primary supply and core supply.

### 6.11.3 Auxiliary-Supply System ([Link to User's Guide](#))

The auxiliary supply system provides the option to operate the device from auxiliary supplies when the primary supply fails. There are two auxiliary supplies (AUXVCC1 and AUXVCC2) supported in MSP430F67xx. This module supports automatic and manual switching from primary supply to auxiliary supplies while maintaining full functionality. The auxiliary supply system allows threshold-based monitoring of primary and auxiliary supplies. The device can be started from primary supply or AUXVCC1, whichever is higher. Auxiliary supply system enables internal monitoring of voltage levels on primary and auxiliary supplies using ADC10\_A. This module also implements a simple charger for backup capacitors.

### 6.11.4 Backup Subsystem

The backup subsystem operates on a dedicated power supply AUXVCC3. This subsystem includes low-frequency oscillator, real-time clock module, and backup RAM. The functionality of the backup subsystem is retained during LPM3.5. The backup subsystem module registers cannot be accessed by CPU when the high-side SVS is disabled by user.

### 6.11.5 Digital I/O ([Link to User's Guide](#))

Up to eleven 8-bit I/O ports are implemented. For 128-pin options, ports P1 to P10 are complete, and port P11 is 6 bits wide. For 100-pin options, ports P1 to P7 are complete, port P8 is 2 bits wide, and ports P9, P10, and P11 are completely removed. Port PJ contains four individual I/O pins, common to all devices. All I/O bits are individually programmable.

- Any combination of input, output, and interrupt conditions is possible.
- Programmable pullup or pulldown on all ports.
- Programmable drive strength on all ports.
- Edge-selectable interrupt and LPM3.5, LPM4.5 wake-up input capability available for all bits of ports P1 and P2.
- Read-write access to port-control registers is supported by all instructions.
- Ports can be accessed byte-wise (P1 to P11) or word-wise in pairs (PA to PF).

### 6.11.6 Port Mapping Controller ([Link to User's Guide](#))

The port mapping controller allows flexible and reconfigurable mapping of digital functions to ports P2, P3, and P4 (see [Table 6-11](#)). [Table 6-12](#) lists the default settings for all pins that support port mapping.

### 6.11.7 System Module (SYS) [\(Link to User's Guide\)](#)

The SYS module handles many of the system functions within the device. These include power-on reset (POR) and power-up clear (PUC) handling, NMI source selection and management, reset interrupt vector generators, bootloader entry mechanisms, and configuration management (device descriptors). The SYS module also includes a data exchange mechanism using JTAG called a JTAG mailbox that can be used in the application. [Table 6-13](#) lists the SYS module interrupt vector registers.

### 6.11.8 Watchdog Timer (WDT\_A) [\(Link to User's Guide\)](#)

The primary function of the WDT\_A is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the timer can be configured as an interval timer and can generate interrupts at selected time intervals.

### 6.11.9 DMA Controller [\(Link to User's Guide\)](#)

The DMA controller allows movement of data from one memory address to another without CPU intervention. For example, the DMA controller can be used to move data from the ADC10\_A conversion memory to RAM. Using the DMA controller can increase the throughput of peripheral modules. The DMA controller reduces system power consumption by allowing the CPU to remain in sleep mode, without having to awaken to move data to or from a peripheral. [Table 6-14](#) lists the available DMA triggers.

#### 6.11.10 CRC16 ([Link to User's Guide](#))

The CRC16 module produces a signature based on a sequence of entered data values and can be used for data checking purposes. The CRC16 module signature is based on the CRC-CCITT standard.

#### 6.11.11 Hardware Multiplier ([Link to User's Guide](#))

The multiplication operation is supported by a dedicated peripheral module. The module performs operations with 32-, 24-, 16-, and 8-bit operands. The module supports signed and unsigned multiplication as well as signed and unsigned multiply-and-accumulate operations.

#### 6.11.12 Enhanced Universal Serial Communication Interface (eUSCI) ([Links to User's](#)

### **Guide: [UART Mode](#), [SPI Mode](#), [I<sup>2</sup>C Mode](#))**

The eUSCI module is used for serial data communication. The eUSCI module supports synchronous communication protocols such as SPI (3- or 4-pin) and I<sup>2</sup>C, and asynchronous communication protocols such as UART, enhanced UART with automatic baud-rate detection, and IrDA.

The eUSCI\_An module provides support for SPI (3- or 4-pin), UART, enhanced UART, and IrDA.

The eUSCI\_Bn module provides support for SPI (3- or 4-pin) and I<sup>2</sup>C.

Four eUSCI\_A and two eUSCI\_B module are implemented in the MSP430F67xx1A MCUs.

#### **6.11.13 [ADC10\\_A \(Link to User's Guide\)](#)**

The ADC10\_A module supports fast, 10-bit analog-to-digital conversions. The module implements a 10-bit SAR core, sample select control, reference generator and a conversion results buffer. A window comparator with a lower and upper limit allows CPU independent result monitoring with three window comparator interrupt flags.

#### **6.11.14 [SD24\\_B \(Link to User's Guide\)](#)**

The SD24\_B module integrates up to seven independent 24-bit sigma-delta ADCs. Each converter is designed with a fully differential analog input pair and programmable gain amplifier input stage. Also the converters are based on second-order oversampling sigma-delta modulators and digital decimation filters. The decimation filters are comb filters with selectable oversampling ratios of up to 1024.

### 6.11.15 TA0 [\(Link to User's Guide\)](#)

TA0 is a 16-bit timer/counter (Timer\_A type) with three capture/compare registers. TA0 can support multiple capture/compares, PWM outputs, and interval timing (see [Table 6-15](#)). TA0 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

### 6.11.21 Real-Time Clock (RTC\_C) ([Link to User's Guide](#))

The RTC\_C module can be configured for calendar mode providing seconds, hours, day of week, day of month, month, and year. The RTC\_C control and configuration registers are password protected to ensure clock integrity against runaway code. Calendar mode integrates an internal calendar that compensates for months with less than 31 days and includes leap year correction. The RTC\_C also supports flexible alarm functions, offset calibration, temperature compensation, and time capture on two external events. The RTC\_C on this device operates on dedicated AUXVCC3 supply and supports operation in LPM3.5.

### 6.11.22 Reference (REF) Module Voltage Reference ([Link to User's Guide](#))

The REF module generates all of the critical reference voltages that can be used by the various analog peripherals in the device. The analog peripherals include the ADC10\_A, LCD\_C, and SD24\_B modules.

### 6.11.23 LCD\_C ([Link to User's Guide](#))

The LCD\_C driver generates the segment and common signals required to drive a liquid crystal display (LCD). The LCD\_C controller has dedicated data memories to hold segment drive information. Common and segment signals are generated as defined by the mode. Static, 2-mux, 3-mux, 4-mux, up to 8-mux LCDs are supported. The module can provide a LCD voltage independent of the supply voltage with its integrated charge pump. It is possible to control the level of the LCD voltage, and thus contrast, by software. The module also provides an automatic blinking capability for individual segments in static, 2-mux, 3-mux, and 4-mux modes.

### 6.11.24 Comparator\_B ([Link to User's Guide](#))

The primary function of the Comparator\_B module is to support precision slope analog-to-digital conversions, battery voltage supervision, and monitoring of external analog signals.

### 6.11.25 Embedded Emulation Module (EEM) [\(Link to User's Guide\)](#)

The EEM supports real-time in-system debugging. The L version of the EEM has the following features:

- Eight hardware triggers or breakpoints on memory access
- Two hardware triggers or breakpoints on CPU register write access
- Up to 10 hardware triggers that can be combined to form complex triggers or breakpoints
- Two cycle counters
- Sequencer
- State storage
- Clock control on module level

### 6.11.26 Peripheral File Map

Table 6-21 shows the base address for the registers of each supported peripheral. Table 6-22 through Table 6-63 show the offset addresses for each register. For complete description of these registers, see the [MSP430x5xx and MSP430x6xx Family User's Guide](#).

#### ***Implementation of a 3-Phase Electronic Watt-Hour Meter Using the MSP430F677x(A)***

This application report describes the implementation of a 3-phase electronic electricity meter using the TI MSP430F677x(A) metering processors. This application report includes the necessary information with regard to metrology software and hardware procedures for this single-chip implementation.

#### ***High-Accuracy 3-Phase Electricity Meter With Tamper Detection***

The design implements a highly accurate 3-phase electric meter system using the MSP430F6779 smart meter SoC. It exceeds all of the requirements for ANSI C12.20 and IEC-62053 Class 0.2 meters. ### 8.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MSP MCU devices. Each MSP MCU commercial family member has one of two prefixes: MSP or XMS. These prefixes represent evolutionary stages of product development from engineering prototypes (XMS) through fully qualified production devices (MSP).

**XMS** – Experimental device that is not necessarily representative of the final device's electrical specifications

**MSP** – Fully qualified production device

XMS devices are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

MSP devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (XMS) have a greater failure rate than the standard production devices. TI recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the temperature range, package type, and distribution format. [☒ 8-1](#) provides a legend for reading the complete device name.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

---

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of  $\leq 1000$ ppm threshold. Antimony trioxide based flame retardants must also meet the  $\leq 1000$ ppm threshold requirement.

<sup>(3)</sup> **MSL, Peak Temp.** - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> **Lead finish/Ball material** - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
