

PCA9554 割り込み出力および構成レジスタ付き、リモート 8 ビット I²C/SMBus I/O エクспанダ

1 特長

- I²C からパラレル・ポートへのエクспанダ
- オープン・ドレインのアクティブ LOW 割り込み出力
- 2.3V～5.5V の動作電源電圧範囲
- 5V 対応の I/O
- 400kHz の高速 I²C バス
- 3 本のアドレス・ピンにより、最大 8 個のデバイスを I²C/SMBus バスに接続可能
- 入力 / 出力構成レジスタ
- 極性反転レジスタ
- パワー・オン・リセット機能を内蔵
- 電源投入時はすべてのチャンネルが入力に構成された状態
- 電源投入時のグリッチなし
- 大電流の最大駆動能力を持つラッチ付き出力により、LED を直接駆動
- JESD 78、Class II 準拠で 100mA 超のラッチアップ性能
- JESD 22 を超える ESD 保護
 - 2000V、人体モデル (A114-A)
 - 200V、マシン・モデル (A115-A)
 - 1000V、荷電デバイス・モデル (C101)

2 概要

この 2 線式双方向バス (I²C) 用 8 ビット I/O エクспанダは、2.3V～5.5V の V_{CC} で動作するように設計されています。I²C インターフェイス [シリアル・クロック (SCL)、シリアル・データ (SDA)] により、ほとんどのマイクロコントローラ・ファミリの汎用リモート I/O 拡張に使用できます。

PCA9554 は、構成 (入力 / 出力選択)、入力、出力、極性反転 (アクティブ HIGH またはアクティブ LOW) 用の 8 ビット・レジスタをそれぞれ 1 個ずつ搭載しています。電源オン時、I/O は V_{CC} への弱いプルアップを備えた入力として構成されます。しかし、システム・マスタは、I/O 構成ビットに書き込むことで、I/O を入力または出力として有効にできます。それぞれの入力または出力のデータは、対応する入力または出力レジスタに保持されます。入力ポート・レジスタの極性は、極性反転レジスタで反転できます。すべてのレジスタをシステム・マスタで読み出すことができます。

タイムアウトまたはその他の不適切な動作が発生した場合、システム・マスタはパワー・オン・リセット機能を利用して PCA9554 をリセットできます。これにより、レジスタはデフォルト状態になり、I²C/SMBus ステート・マシンは初期化されます。

PCA9554 のオープン・ドレイン割り込み ($\overline{\text{INT}}$) 出力は、いずれかの入力の状態が、対応する入力ポート・レジスタの状態と異なっている場合にアクティブになるため、入力状態が変化したことをシステム・マスタに示すために使用されます。

4 概要 (続き)

$\overline{\text{INT}}$ はマイクロコントローラの割り込み入力に接続できます。この配線で割り込み信号を送ることでリモート I/O は、I²C バス経由で通信しなくてもポート上に受信データが存在するかどうかをマイクロコントローラに通知できます。そのため、PCA9554 はシンプル・スレーブ・デバイスとして機能できます。

本デバイスの出力 (ラッチ付き) は大電流駆動能力を備えているため LED を直接駆動でき、低消費電流です。

3 本のハードウェア・ピン (A0、A1、A2) を使って固定 I²C アドレスをプログラムおよび変更することで、最大 8 つのデバイスが同じ I²C バスまたは SMBus を共有できます。

PCA9554 は PCF8574 とピン互換、I²C アドレス互換です。しかし PCA9554 では、PCF8574 に対して機能が拡張されているため、ソフトウェアを変更する必要があります。

PCA9554 と PCA9554A は、固定 I²C アドレスを除くと同じです。そのため、これらのデバイス最大 16 個 (各 8 個) を同じ I²C/SMBus に接続できます。

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.

6.2 ESD Ratings

			MIN	MAX	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	0	2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	0	1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8-2. Simplified Schematic Of P0 To P7

8.2 Device Functional Modes

8.2.1 Power-On Reset

When power (from 0 V) is applied to V_{CC}, an internal power-on reset holds the PCA9554 in a reset condition until V_{CC} has reached V_{POR}. At that point, the reset condition is released and the PCA9554 registers and I²C/SMBus state machine initialize to their default states. After that, V_{CC} must be lowered to below 0.2 V and then back up to the operating voltage for a power-reset cycle.

8.2.2 I/O Port

When an I/O is configured as an input, FETs Q1 and Q2 (in [Figure 8-2](#)) are off, which creates a high-impedance input with a weak pullup (100 k Ω typ) to V_{CC} . The input voltage may be raised above V_{CC} to a maximum of 5.5 V.

If the I/O is configured as an output, Q1 or Q2 is enabled, depending on the state of the output port register. In this case, there are low-impedance paths between the I/O pin and either V_{CC} or GND. The external voltage applied to this I/O pin should not exceed the recommended levels for proper operation.

8.2.3 Interrupt Output ($\overline{\text{INT}}$)

An interrupt is generated by any rising or falling edge of the port inputs in the input mode. After time, t_{iv} , the signal $\overline{\text{INT}}$ is valid. Resetting the interrupt circuit is achieved when data on the port is changed to the original setting, data is read from the port that generated the interrupt. Resetting occurs in the read mode at the acknowledge (ACK) or not acknowledge (NACK) bit after the rising edge of the SCL signal.

Interrupts that occur during the ACK or NACK clock pulse can be lost (or be very short) due to the resetting of the interrupt during this pulse. Each change of the I/Os after resetting is detected and is transmitted as $\overline{\text{INT}}$. Writing to another device does not affect the interrupt circuit, and a pin configured as an output cannot cause an interrupt. Changing an I/O from an output to an input may cause a false interrupt to occur, if the state of the pin does not match the contents of the Input Port register. Because each 8-pin port is read independently, the interrupt caused by port 0 is not cleared by a read of port 1 or vice versa.

The $\overline{\text{INT}}$ output has an open-drain structure and requires pullup resistor to V_{CC} .

8.2.3.1 Interrupt Errata

Description

The INT will be improperly de-asserted if the following two conditions occur:

1. The last I²C command byte (register pointer) written to the device was 00h.

Note

This generally means the last operation with the device was a Read of the input register. However, the command byte may have been written with 00h without ever going on to read the input register. After reading from the device, if no other command byte written, it will remain 00h.

2. Any other slave device on the I²C bus acknowledges an address byte with the R/W bit set high

8.2.3.1.1

System Impact

Can cause improper interrupt handling as the Master will see the interrupt as being cleared.

8.2.3.1.2

System Workaround

Minor software change: User must change command byte to something besides 00h after a Read operation to the PCA9554 device or before reading from another slave device.

Note

Software change will be compatible with other versions (competition and TI redesigns) of this device.

8.3 Programming

8.3.1 I²C Interface

The bidirectional I²C bus consists of the serial clock (SCL) and serial data (SDA) lines. Both lines must be connected to a positive supply through a pullup resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

I²C communication with this device is initiated by a master sending a start condition, a high-to-low transition on the SDA input/output while the SCL input is high (see [Figure 8-3](#)). After the start condition, the device address byte is sent, MSB first, including the data direction bit (R/ $\overline{\text{W}}$).

After receiving the valid address byte, this device responds with an acknowledge (ACK), a low on the SDA input/output during the high of the ACK-related clock pulse. The address inputs (A0–A2) of the slave device must not be changed between the start and the stop conditions.

On the I²C bus, only one data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the high pulse of the clock period, as changes in the data line at this time are interpreted as control commands (start or stop) (see [Figure 8-4](#)).

A Stop condition, a low-to-high transition on the SDA input/output while the SCL input is high, is sent by the master (see [Figure 8-3](#)).

Any number of data bytes can be transferred from the transmitter to the receiver between the start and the stop conditions. Each byte of eight bits is followed by one ACK bit. The transmitter must release the SDA line before the receiver can send an ACK bit. The device that acknowledges must pull down the SDA line during the ACK clock pulse so that the SDA line is stable low during the high pulse of the ACK-related clock period (see [Figure 8-5](#)). When a slave receiver is addressed, it must generate an ACK after each byte is received. Similarly, the master must generate an ACK after each byte that it receives from the slave transmitter. Setup and hold times must be met to ensure proper operation.

A master receiver will signal an end of data to the slave transmitter by not generating an acknowledge (NACK) after the last byte has been clocked out of the slave. This is done by the master receiver by holding the SDA line high. In this event, the transmitter must release the data line to enable the master to generate a Stop condition.

The last bit of the slave address defines the operation (read or write) to be performed. When it is high (1), a read is selected, while a low (0) selects a write operation.

8.3.2.2 Control Register And Command Byte

Following the successful acknowledgment of the address byte, the bus master sends a command byte that is stored in the control register in the PCA9554. Two bits of this command byte state the operation (read or write) and the internal register (input, output, polarity inversion or configuration) that will be affected. This register can be written or read through the I²C bus. The command byte is sent only during a write transmission.

Once a command byte has been sent, the register that was addressed continues to be accessed by reads until a new command byte has been sent.

图 8-7. Control Register Bits

表 8-3. Command Byte

CONTROL REGISTER BITS		COMMAND BYTE (HEX)	REGISTER	PROTOCOL	POWER-UP DEFAULT

8.3.2.3 Register Descriptions

The Input Port register (register 0) reflects the incoming logic levels of the pins, regardless of whether the pin is defined as an input or an output by the Configuration register. It only acts on read operation. Writes to these registers have no effect. The default value, X, is determined by the externally applied logic level.

Before a read operation, a write transmission is sent with the command byte to indicate to the I²C device that the Input Port register will be accessed next.

表 8-4. Register 0 (Input Port Register) Table

BIT	I7	I6	I5	I4	I3	I2	I1	I0
DEFAULT	X	X	X	X	X	X	X	X

The Output Port register (register 1) shows the outgoing logic levels of the pins defined as outputs by the Configuration register. Bit values in this register have no effect on pins defined as inputs. In turn, reads from this register reflect the value that is in the flip-flop controlling the output selection, not the actual pin value.

表 8-5. Register 1 (Output Port Register) Table

BIT	O7	O6	O5	O4	O3	O2	O1	O0
DEFAULT	1	1	1	1	1	1	1	1

The Polarity Inversion register (register 2) allows polarity inversion of pins defined as inputs by the Configuration register. If a bit in this register is set (written with 1), the corresponding port pin polarity is inverted. If a bit in this register is cleared (written with a 0), the corresponding port pin's original polarity is retained.

表 8-6. Register 2 (Polarity Inversion Register) Table

BIT	N7	N6	N5	N4	N3	N2	N1	N0
DEFAULT	0	0	0	0	0	0	0	0

The Configuration register (register 3) configures the directions of the I/O pins. If a bit in this register is set to 1, the corresponding port pin is enabled as an input with high impedance output driver. If a bit in this register is cleared to 0, the corresponding port pin is enabled as an output.

8.3.2.4 Bus Transactions

Data is exchanged between the master and PCA9554 through write and read commands.

8.3.2.4.1 Writes

Data is transmitted to the PCA9554 by sending the device address and setting the least-significant bit to a logic 0 (see [Figure 8-6](#) for device address). The command byte is sent after the address and determines which register receives the data that follows the command byte. There is no limitation on the number of data bytes sent in one write transmission.

**Figure 8-8. Write To Output Port Register****Figure 8-9. Write To Configuration Or Polarity Inversion Registers**

8.3.2.4.2 Reads

The bus master first must send the PCA9554 address with the least-significant bit set to a logic 0 (see [Figure 8-6](#) for device address). The command byte is sent after the address and determines which register is accessed. After a restart, the device address is sent again but, this time, the least-significant bit is set to a logic 1. Data from the register defined by the command byte then is sent by the PCA9554 (see [Figure 8-10](#) and [Figure 8-11](#)). After a restart, the value of the register defined by the command byte matches the register being accessed when the restart occurred. Data is clocked into the register on the rising edge of the ACK clock pulse. There is no limitation on the number of data bytes received in one read transmission, but when the final byte is received, the bus master must not acknowledge the data

8-10. Read From Register

- A. This figure assumes the command byte has previously been programmed with 00h.
- B. Transfer of data can be stopped at any moment by a Stop condition.
- C. This figure eliminates the command byte transfer, a restart, and slave address call between the initial slave address call and actual data transfer from P port. See 8-10 for these details.

9 Application Information Disclaimer

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

9.1.1 Typical Application

Figure 9-1 shows an application in which the PCA9554 can be used.

- A. Device address is configured as 0100000 for this example.
- B. P0, P2, and P3 are configured as outputs.
- C. P1, P4, and P5 are configured as inputs.
- D. P6 and P7 are not used and have internal 100-kΩ pullup resistors to protect them from floating.

Figure 9-1. Typical Application

9.1.1.1 Design Requirements

9.1.1.1.1 Minimizing I_{CC} When I/Os Control Leds

When the I/Os are used to control LEDs, they are normally connected to V_{CC} through a resistor as shown in [Figure 9-1](#). The LED acts as a diode, so when the LED is off, the I/O V_{IN} is about 1.2 V less than V_{CC} . ΔI_{CC} in *Electrical Characteristics* shows how I_{CC} increases as V_{IN} becomes lower than V_{CC} .

For battery-powered applications, it is essential that the voltage of I/O pins is greater than or equal to V_{CC} when the LED is off to minimize current consumption. [Figure 9-2](#) shows a high-value resistor in parallel with the LED. [Figure 9-3](#) shows V_{CC} less than the LED supply voltage by at least 1.2 V. Both of these methods maintain the I/O V_{IN} at or above V_{CC} and prevent additional supply-current consumption when the LED is off.

10 Power Supply Recommendations

10.1 Power-On Reset Requirements

In the event of a glitch or data corruption, PCA9554 can be reset to its default conditions by using the power-on reset feature. Power-on reset requires that the device go through a power cycle to be completely reset. This reset also happens when the device is powered on for the first time in an application.

The two types of power-on reset are shown in [Figure 10-1](#) and [Figure 10-2](#).

Figure 10-1. V_{CC} Is Lowered Below 0.2 V Or 0 V And Then Ramped Up To V_{CC}

Figure 10-2. V_{CC} Is Lowered Below The Por Threshold, Then Ramped Back Up To V_{CC}

[Table 10-1](#) specifies the performance of the power-on reset feature for PCA9554 for both types of power-on reset.

Table 10-1. Recommended Supply Sequencing And Ramp Rates⁽¹⁾

PARAMETER			MIN	TYP	MAX	UNIT
V _{CC_FT}	Fall rate	See Figure 10-1	1		100	ms
V _{CC_RT}	Rise rate	See Figure 10-1	0.01		100	ms
V _{CC_TRR_GND}	Time to re-ramp (when V _{CC} drops to GND)	See Figure 10-1	0.001			ms
V _{CC_TRR_POR50}	Time to re-ramp (when V _{CC} drops to V _{POR_MIN} – 50 mV)	See Figure 10-2	0.001			ms
V _{CC_GH}	Level that V _{CCP} can glitch down to, but not cause a functional disruption when V _{CCX_GW} = 1 μs	See Figure 10-3			1.2	V
V _{CC_GW}	Glitch width that will not cause a functional disruption when V _{CCX_GH} = 0.5 × V _{CCX}	See Figure 10-3				μs
V _{PORF}	Voltage trip point of POR on falling V _{CC}		0.767		1.144	V
V _{PORR}	Voltage trip point of POR on rising V _{CC}		1.033		1.428	V

(1) T_A = –40°C to 85°C (unless otherwise noted)

Glitches in the power supply can also affect the power-on reset performance of this device. The glitch width (V_{CC_GW}) and height (V_{CC_GH}) are dependent on each other. The bypass capacitance, source impedance, and the device impedance are factors that affect power-on reset performance. [Figure 10-3](#) and [Table 10-1](#) provide more information on how to measure these specifications.

FIG 10-3. Glitch Width And Glitch Height

V_{POR} is critical to the power-on reset. V_{POR} is the voltage level at which the reset condition is released and all the registers and the I²C/SMBus state machine are initialized to their default states. The value of V_{POR} differs based on the V_{CC} being lowered to or from 0. FIG 10-4 and Table 10-1 provide more details on this specification.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
