

TMP1075 温度センサ、I²C および SMBus インターフェイス付き、業界標準の LM75 フォーム・ファクタおよびピン配置

1 特長

- 温度精度:
 - 55°C ~ +125°C で $\pm 0.25^\circ\text{C}$ (標準値)
 - 40°C ~ +110°C で $\pm 1^\circ\text{C}$ (最大値)
 - 55°C ~ +125°C で $\pm 2^\circ\text{C}$ (最大値)
- 低消費電力:
 - 平均消費電流 2.7 μA
 - シャットダウン時電流 0.37 μA
- 電源電圧範囲オプション: 1.62V ~ 5.5V
- 温度は電源と無関係
- デジタル・インターフェイス: SMBus、I²C
- 業界標準 LM75 および TMP75 とのソフトウェア互換性
- I³C Mixed Fast Mode バス内に共存可能
- 分解能: 12 ビット
- 最大 32 の I2C アドレスをサポート
- ALERT ピン機能
- NIST トレース可能

2 アプリケーション

- 電源温度のモニタリング
- コンピュータ・ペリフェラルの熱保護
- ノート PC
- 携帯電話
- バッテリー管理
- オフィス機器
- サーモスタット制御
- 環境監視および HVAC
- 電気機械装置の温度

3 概要

TMP1075 は、業界標準の LM75 および TMP75 デジタル温度センサの代替品として、最も高精度で低消費電力の製品です。TMP1075 は SOIC-8、VSSOP-8、WSO-8、SOT563-6 パッケージで供給され、ピン互換、ソフトウェア互換なので、既存の xx75 の設計を迅速にアップグレードできます。TMP1075 には新たに 2.0 × 2.0mm の DFN および 1.6 × 1.6mm の SOT563-6 パッケージが追加され、SOIC パッケージに比べてプリント基板 (PCB) のフットプリントをそれぞれ 82% および 89% 削減できます。

TMP1075 は、広い温度範囲にわたって $\pm 1^\circ\text{C}$ の精度であり、オンチップの 12 ビット A/D コンバータ (ADC) により 0.0625°C の温度分解能を実現します。

TMP1075 は 2 線式の SMBus および I²C インターフェイスと互換性があり、最大 32 のデバイス・アドレスをサポートし、SMBus のリセットおよびアラート機能があります。

製品情報⁽¹⁾

部品番号	パッケージ	本体サイズ (公称)
TMP1075	VSSOP / DGK (8)	3.00mm × 3.00mm
	SOIC / D (8)	4.90mm × 3.91mm
	WSO / DSG (8)	2.00mm × 2.00mm
	SOT563 / DRL (6) ⁽²⁾	1.20mm × 1.60mm

- 利用可能なすべてのパッケージについては、このデータシートの末尾にある注文情報を参照してください。
- TMP1075N を注文可能として提供しています。

4 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Changes from Revision D (October 2019) to Revision E (August 2021)	Page
• TMP1075N の特長を一覧に追加.....	1
• 「特長」の一覧に標準精度の仕様を追加.....	1
• SOT563 (TMP1075N 注文可能) パッケージを追加.....	1
• 「概要」に TMP1075N の温度範囲を追加 (続きのセクション).....	4
• Added Device Comparison Section.....	4
• Added figures for different package options.....	5
• Added column for TMP1075N pin numbers.....	5
• Added TMP1075N Specifications.....	6
• Added <i>TMP1075NDR L Temperature Error vs. Temperature</i> graph	11
• Added TMP1075N information in Overview Section.....	13
• Changed the <i>Functional Block Diagram</i> to apply to TMP1075N.....	13
• Added number of I2C addresses available on TMP1075N to Serial Bus Address Section.	15
• Added table for TMP1075N address options.	15
• Updated internal register structure figure to apply to TMP1075N.....	15
• Added typical specification for TMP1075N timeout	17
• Added clarification on timeout function to include SCL.....	17
• Removed redundant information to accurately describe all packages.....	20
• Added TMP1075N OS bit behavior.....	20
• Added TMP1075N Continuous Conversion Mode information.....	20
• Updated Conversion Rate Diagram to reflect all TMP1075 and TMP1075N.....	20
• Clarified what TM bit behavior for TMP1075 and TMP1075N	21
• Added table note to indicate Device ID register is not available on TMP1075N.....	22
• Added TMP1075N configuration register information	23
• Updated text to indicate that device ID register does not apply to TMP1075N.....	25
• Added number of I2C addresses available on TMP1075N.....	26
• Changed Typical Connections figure to apply to TMP1075N.....	26
• Removed redundant Application Curve section.....	26
• Updated text to include TMP1075N information.....	26

• Updated Migrating From the xx75 Device Family section to specify TMP1075 compatible packages	27
• Included TMP1075N information to Power Supply Recommendations.....	27
• Added figures to the <i>Layout Example</i> section for each package.....	28

Changes from Revision C (January 2019) to Revision D (October 2019)	Page
--	-------------

• 「特長」の一覧にソフトウェア互換性を追加.....	1
• Updated absolute max for Power supply V+ to 6.5V from 6V.....	6
• Updated absolute max for Input voltage on SCL, SDA, A1, A0 to 6.5V from 6V.....	6
• Updated pointer register to be part of the serial interface description.....	15
• Updated the register map table to new format.....	22
• Added access type codes for register bits.....	22
• Updated temperature register format and bit definition table.....	22
• Updated configuration register format and bit definition table	23
• Updated low limit register format and bit definition table	24
• Updated high limit register format and bit definition table	24
• Updated device ID register format and bit definition table	25

Changes from Revision B (December 2018) to Revision C (January 2019)	Page
---	-------------

• TMP1075DSG パッケージをプレビューから量産データに変更.....	1
• 「温度精度 (DGK & D)」グラフで、最小/最大限界値を 1.5°Cから 1°Cに変更.....	1
• Changed min/max limit from 1.5°C to 1°C in the <i>DGK & D Temperature Error vs. Temperature</i> graph.....	11
• Added <i>DSG Temperature Error vs. Temperature</i> graph	11

Changes from Revision A (June 2018) to Revision B (December 2018)	Page
--	-------------

• TMP1075DSG パッケージを追加.....	1
• データシートの「概要」セクションを更新し、「概要 (続き)」セクションを追加.....	1
• Added TMP1075 configuration register support for single byte read and write.....	23
• Added Software support section for migrating from xx75 to TMP1075	27

Changes from Revision * (March 2018) to Revision A (June 2018)	Page
---	-------------

• TMP1075DGK の注文ステータスを「事前情報」から「量産データ」に変更.....	1
• SOIC および DFN パッケージを追加.....	1
• Changed the <i>Functional Block Diagram</i>	13
• Changed <i>Digital Temperature Output</i> crossreference from: <i>Temperature Register (0x00)</i> to: <i>Temperature Data Format</i>	14
• Changed the <i>Temperature Data Format</i> table	14
• Changed and renamed the <i>Address Pins and Slave Addresses for the TMP1075</i> table to <i>Address Pins State</i>	15
• Changed the <i>Two-Wire Timing Diagrams</i> section	18
• Added content to the <i>Device Functional Modes</i> section	20

5 概要 (続き)

TMP1075 は事実上あらゆるテレコミュニケーション、エンタープライズ、産業用、個人用の電子機器において、高精度でコスト効率の優れた温度測定を行えるよう設計されています。

TMP1075 D、DGK、DSG パッケージは -55°C～+125°C の温度範囲で動作が規定されており、TMP1075N DRL パッケージは -40°C～+125°C の温度範囲で動作が規定されています。

TMP1075 ユニットの製造時のセットアップで 100% テスト済みであり、このテストは NIST トレース可能で、ISO/IEC 17025 で認定された基準に対して較正済みの機器により検証されています。

6 Device Comparison

表 6-1 lists the key specification and feature differences between the different TMP1075 packages.

表 6-1. Package Feature and Spec Comparison

SPEC/FEATURE	TMP1075			TMP1075N
	D	DGK	DSG	DRL
Supply Voltage	1.7 V to 5.5 V	1.7 V to 5.5 V	1.7 V to 5.5 V	1.62 V to 3.6V
Temperature Range	-55°C to +125°C	-55°C to +125°C	-55°C to +125°C	-40°C to +125°C
Body Size	4.90 mm × 3.91 mm	3.00 mm × 3.00 mm	2.00 mm × 2.00 mm	1.60 mm × 1.20 mm
Accuracy	±1.0°C: -40°C to +110°C ±2.0°C: -55°C to +125°C	±1.0°C: -40°C to +110°C ±2.0°C: -55°C to +125°C	±1.0°C: -40°C to +75°C ±2.0°C: -55°C to +125°C	±1.0°C: -10°C to +60°C ±2.0°C: -40°C to +125°C
I2C Addresses	32	32	32	4
Conversion Rate Settings	Yes	Yes	Yes	No
Device ID	Yes	Yes	Yes	No

7 Pin Configuration and Functions

7-1. D Package 8-Pin SOIC Top View

7-2. DGK Package 8-Pin VSSOP Top View

7-3. DSG Package 8-Pin WSON Top View

7-4. DRL Package 6-Pin SOT563 Top View

表 7-1. Pin Functions

NAME	PIN		I/O	DESCRIPTION
	SOIC / VSSOP / WSON	SOT563		
A0	7	4	I	Address select A0: Connect to GND, V+, SDA, or SCL
A1	6	—	I	Address select A1: Connect to GND, V+, SDA, or SCL
A2	5	—	I	Address select A2: Connect to GND or V+
ALERT	3	3	O	Overtemperature alert; Open-drain output that requires a pullup resistor
GND	4	2	—	Ground
SCL	2	1	I	Serial clock
SDA	1	6	I/O	Serial data. Open-drain output that requires a pullup resistor
V+	8	5	I	Supply voltage, 1.7 V to 5.5 V (TMP1075); 1.62 V to 3.6 V (TMP1075N)

8 Specifications

8.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Power supply, V+	TMP1075		6.5	V
	TMP1075N		4	
Input voltage SCL, SDA, A1, A0	TMP1075	−0.3	6.5	V
Input voltage SCL, SDA, A0	TMP1075N	−0.3	4	V
Input voltage ALERT	TMP1075N		(V+)+0.3 and ≤4	V
Input voltage A2 pin	TMP1075	−0.3	(V+) + 0.3	V
Operating temperature		−55	150	°C
Junction temperature, T _J			150	°C
Storage temperature, T _{stg}		−60	130	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

8.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Supply voltage	TMP1075	1.7		5.5	V
	TMP1075N	1.62	3.3	3.6	V
Operating free-air temperature, T _A	TMP1075	−55		125	°C
	TMP1075N	−40		125	°C

8.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TMP1075	TMP1075	TMP1075	TMP1075N	UNIT
		DGK (VSSOP)	D (SOIC)	DSG (WSON)	DRL (SOT)	
		8 PINS	8 PINS	8 PINS	6 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	202.5	130.4	87.4	210.3	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	82	76.9	111.1	105.0	°C/W
R _{θJB}	Junction-to-board thermal resistance	124.4	72.3	54	87.5	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	17.9	32	9.8	6.1	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	122.6	71.9	54.4	87.0	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	—	—	28.1	—	°C/W
M _T	Thermal mass	16.6	64.2	5.0	—	mJ/°C

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

8.5 Electrical Characteristics:TMP1075

at T_A = –55°C to +125°C and V₊ = 1.7 V to 5.5 V (unless noted); typical specification are at T_A = 25°C and V₊ = 3.3 V

PARAMETER			TEST CONDITIONS		MIN	TYP	MAX	UNIT
TEMPERATURE INPUT								
	Range				–55		125	°C
	Accuracy (temperature error)	DGK, D	–40°C to +110°C			±0.25	±1	°C
			–55°C to +125°C			±0.25	±2	
		DSG	–40°C to +75°C			±0.25	±1	°C
			–55°C to +125°C			±0.25	±2	°C
	Accuracy (temperature error) vs. supply		PSRR				±0.03	°C/V
	Resolution		1 LSB (12 bit)			0.0625		°C
	Repeatability ⁽¹⁾		25°C, V+= 3.3 V ⁽²⁾			0.0625		°C
	Long-term drift ⁽³⁾		500 hours at 150°C, 5.5V			0.0625		°C

	Conversion Rate Variation				–10	0	10	%
POWER SUPPLY								
	Operating voltage range				1.7	3.3	5.5	V

TMP1075

JAJSF26E – MARCH 2018 – REVISED AUGUST 2021

 at $T_A = -55^{\circ}\text{C}$ to $+125^{\circ}\text{C}$ and $V+ = 1.7\text{ V}$ to 5.5 V (unless noted); typical specification are at $T_A = 25^{\circ}\text{C}$ and $V+ = 3.3\text{ V}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_Q	Quiescent current (serial bus inactive)	$R1 = 0, R0 = 0$ (default)		10	20	μA
		$R1 = 0, R0 = 1$		5.5	9	μA
		$R1 = 1, R0 = 0$		4	6	
		$R1 = 1, R0 = 1$		2.7	4	
		During 5.5 ms active conversion		52	85	μA
I_{SD}	Shutdown current	Serial bus active, SCL frequency = 400 kHz, $A0=A1=A2=GND$		13		μA
		Serial bus inactive, $A0=A1=A2=SCL=SDA=V+$, 25°C		0.37	0.65	μA
		Serial bus inactive, $A0=A1=A2=SCL=SDA=V+$		0.37	3.5	μA
	Power supply thresholds	Supply rising, Power-on Reset		1.22		V
		Supply failing, Brown-out Detect		1.1		

- (1) Repeatability is the ability to reproduce a reading when the measured temperature is applied consecutively, under the same conditions.
- (2) One-shot mode setup, 1 sample per minute for 24 hours.
- (3) Long-term drift is determined using accelerated operational life testing at a junction temperature of 150°C .

8.6 Electrical Characteristics: TMP1075N

 At $T_A = 25^{\circ}\text{C}$ and $V+ = 1.62$ to 3.6 V (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
TEMPERATURE SENSOR						
	Temperature Operating Range		-40		125	$^{\circ}\text{C}$
T_{ERR}	Temperature accuracy	-10°C to 60°C		0.25	± 1	$^{\circ}\text{C}$
		-40°C to 125°C		0.5	± 2	
PSR	DC power supply rejection			0.2	0.5	$^{\circ}\text{C}/\text{V}$
T_{RES}	Temperature resolution	Including sign bit		12		Bits
		LSB		62.5		m°C
t_{CONV}	Conversion time			26	35	ms
DIGITAL INPUT/OUTPUT						
C_{IN}	Input capacitance			3		pF
V_{IH}	Input logic high level		$0.7 \times V+$		3.6	V
V_{IL}	Input logic low level			$0.3 \times V+$		V
I_{IN}	Input leakage current	$0\text{ V} < V+ < 3.6\text{ V}$			1	μA
V_{OL}	Output low level	SDA, ALERT ($V+ > 2\text{ V}$, $I_{OL} = 3\text{ mA}$)	0		0.4	V
V_{OL}	Output low level	SDA, ALERT ($V+ < 2\text{ V}$, $I_{OL} = 3\text{ mA}$)	0		$0.2 \times V+$	V
POWER SUPPLY						
$V+$	Operating supply range		1.62		3.6	V
I_{DD_AVG}	Average current consumption	Serial bus inactive		7	10	μA
		Serial bus active, SCL frequency = 400 kHz		15		
		Serial bus active, SCL frequency = 2.85 MHz		85		
I_{DD_SD}	Shutdown current	Serial bus inactive		0.5	1	μA
		Serial bus active, SCL frequency = 400 kHz		10		μA
		Serial bus active, SCL frequency = 2.85 MHz		80		μA

8.7 Timing Requirements:TMP1075

minimum and maximum specifications are over -55°C to 125°C and $V+ = 1.7\text{ V}$ to 5.5 V (unless otherwise noted)⁽¹⁾

		FAST MODE		HIGH-SPEED MODE		UNIT
		MIN	MAX	MIN	MAX	
f_{SCL}	SCL operating frequency	0.001	0.4	0.001	2.56	MHz
t_{BUF}	Bus-free time between STOP and START conditions	1300		160		ns
t_{HDSTA}	Hold time after repeated START condition. After this period, the first clock is generated.	600		160		ns
t_{SUSTA}	Repeated START condition setup time	600		160		ns
t_{SUSTO}	STOP condition setup time	600		160		ns
t_{HDDAT}	Data hold time ⁽²⁾	0		0	130	ns
t_{SUDAT}	Data setup time	100		20		ns
t_{LOW}	SCL clock low period	1300		250		ns
t_{HIGH}	SCL clock high period	600		60		ns
t_{VDAT}	Data valid time (data response time) ⁽³⁾		900		130	ns
t_{FDA}	Data fall time		300		100	ns
t_{R}	Clock rise time		300		40	ns
t_{F}	Clock fall time		300		40	ns
t_{timeout}	Timeout (SCL = SDA = GND)	20	30	20	30	ms
t_{RC}	Clock/ data rise time for SCL = 100 kHz		1000			ns

(1) The host and device have the same $V+$ value. Values are based on statistical analysis of samples tested during initial release.

(2) The maximum t_{HDDAT} can be $0.9\text{ }\mu\text{s}$ for fast mode, and is less than the maximum t_{VDAT} by a transition time.

(3) t_{VDAT} = time for data signal from SCL LOW to SDA output (HIGH to LOW, depending on which is worse). = time for data signal from SCL LOW to SDA output (HIGH to LOW, depending on which is worse).

8.8 Timing Requirements: TMP1075N

minimum and maximum specifications are over -40°C to 125°C and $V+ = 1.62\text{ V}$ to 3.6 V (unless otherwise noted)⁽¹⁾

			FAST MODE		HIGH-SPEED MODE		UNIT
			MIN	MAX	MIN	MAX	
f_{SCL}	SCL operating frequency		0.001	0.4	0.001	2.85	MHz
t_{BUF}	Bus-free time between STOP and START conditions		600		160		ns
t_{HDSTA}	Hold time after repeated START condition. After this period, the first clock is generated.		600		160		ns
t_{SUSTA}	Repeated START condition setup time		600		160		ns
t_{SUSTO}	STOP condition setup time		600		160		ns
t_{HDDAT}	Data hold time ⁽²⁾		100	900	25	105	ns
t_{SUDAT}	Data setup time		100		25		ns
t_{LOW}	SCL clock low period		1300		210		ns
t_{HIGH}	SCL clock high period		600		60		ns
t_{FD}	Data fall time			300		80	ns
t_{RD}	Data rise time			300			
		SCLK $\leq 100\text{ kHz}$		1000			
t_{RC}	Clock rise time			300		40	ns
t_{FC}	Clock fall time			300		40	ns
t_{timeout}	Timeout (SCL = SDA = GND)		30	40	30	40	ms

(1) The host and device have the same $V+$ value. Values are based on statistical analysis of samples tested during initial release.

(2) The maximum t_{HDDAT} can be $0.9\text{ }\mu\text{s}$ for fast mode, and is less than the maximum t_{VDAT} by a transition time.

8.9 Switching Characteristics

over operating free-air temperature range (unless otherwise noted)

			MIN	TYP	MAX	UNIT
t_{LPF}	Spike filter for I ² C compatibility	SCL = 12.5 MHz		50		ns

8.10 Typical Characteristics

at $T_A = 25^\circ\text{C}$, $V_+ = 3.3\text{ V}$, and apply to D, DGK, and DSG packages (unless otherwise noted)

8-1. DGK & D Temperature Error vs. Temperature

8-2. DSG Temperature Error vs. Temperature

8-8. ALERT Pin Output Voltage vs. Sink Current

8-9. Sampling Period Change vs. Temperature (1.7 V to 5.5 V)

9 Detailed Description

9.1 Overview

The TMP1075 device is a digital temperature sensor that is optimal for thermal management and thermal protection applications. The TMP1075 is a SMBus and is I²C interface-compatible. It is also capable of coexisting in an I³C bus when in Mixed Fast Mode. The TMP1075 non-N orderables are specified over a temperature range of -55°C to +125°C and the TMP1075N orderable is specified over the -40°C to +125°C temperature range. The [Figure 9-1](#) section shows an internal block diagram of TMP1075 device.

The temperature sensor thermal path runs through the package leads as well as the plastic package. The leads provide the primary thermal path due to the lower thermal resistance of the metal.

9.2 Functional Block Diagram

*Pin is not available on TMP1075N

** ESD Diode only in TMP1075N

Figure 9-1. Functional Block Diagram

9.3 Feature Description

9.3.1 Digital Temperature Output

The digital output from each temperature measurement conversion is stored in the read-only temperature register. Which is a 12-bit, read-only register that stores the output of the most recent conversion. Two bytes must be read to obtain data. However, only the first 12 MSBs are used to indicate temperature while the remaining 4 LSB are set to zero. 表 9-1 lists the data format for the temperature. Negative numbers are represented in binary two's-complement format. After power-up or reset, the temperature register reads 0°C until the first conversion is complete.

表 9-1. Temperature Data Format

TEMPERATURE (°C)	DIGITAL OUTPUT

9.3.2 I²C and SMBus Serial Interface

The TMP1075 operates as a target device on the two-wire, SMBus and I²C interface-compatible bus. Connections to the bus are made through the open-drain I/O line SDA and SCL input pin. The SDA and SCL pins feature integrated spike suppression filters and Schmitt triggers to minimize the effects of input spikes and bus noise. The TMP1075 supports the transmission protocol for fast mode up to 400 kHz and high-speed mode up to 2.56 MHz. All data bytes are transmitted MSB first.

9.3.2.1 Bus Overview

The device that initiates the data transfer is called a host, and the devices controlled by the host are the target. The bus must be controlled by a host device that generates the SCL that controls the bus access and generates the START and STOP conditions.

To address a specific device, a START condition is initiated. This is indicated by the host pulling the data line SDA from a high to low logic level when SCL is high. All target devices on the bus shift in the device address byte on the rising edge of the clock with the last bit indicating whether a read or write operation is intended. During the ninth clock pulse, the device being addressed responds to the host by generating an Acknowledge and pulling SDA low.

Data transfer is then initiated and sent over eight clock pulses followed by an Acknowledge bit. During data transfer, SDA must remain stable when SCL is high because any change in SDA when SCL is high is interpreted as a control signal.

When all data are transferred, the host generates a STOP condition indicated by pulling SDA from low to high logic level when SCL is high.

9.3.2.2 Serial Bus Address

To communicate with the TMP1075, the host must first address devices through an address byte. The device address byte consists of seven address bits and a direction bit indicating the intent of executing a read or write operation.

The TMP1075 features three address pins to allow up to 32 devices (TMP1075N: 4) to be addressed on a single bus interface. 表 9-2 and 表 9-3 describe the pin logic levels used to configure the TMP1075 I2C address. The state of pins A0, A1, and A2 is sampled on every bus communication and must be set prior to any activity on the interface.

表 9-2. TMP1075 Address Pins State

A2	A1	A0	7-BIT ADDRESS	A2	A1	A0	7-BIT ADDRESS
0	0	SDA	1000000	0	SDA	SDA	1010000
0	0	SCL	1000001	0	SDA	SCL	1010001
0	1	SDA	1000010	0	SCL	SDA	1010010

表 9-4. Pointer Register Byte

P7	P6	P5	P4	P3	P2	P1	P0
0	0	0	0	Register Bits			

9.3.2.4 Writing and Reading to the TMP1075

Accessing a particular register on the TMP1075 device is accomplished by writing the appropriate value to the pointer register. After Reset, the register value is set to zero. The value for the pointer register is the first byte transferred after the device address byte with the R/W bit low. Every write operation to the TMP1075 requires a value for the pointer register (see 图 9-3).

When reading from the TMP1075 device, the last value stored in the pointer register by a write operation is used to determine which register is read by a read operation. To change the register pointer for a read operation, a new value must be written to the pointer register. This action is accomplished by issuing a device address byte with the R/ $\overline{W}$ bit low, followed by the pointer register byte. No additional data are required. The host can then generate a START condition and send the device address byte with the R/ $\overline{W}$ bit high to initiate the read command. See 图 9-5 for details of this sequence. If repeated reads from the same register are desired, the pointer register bytes do not have to be continually sent because the TMP1075 remembers the pointer register value until the value is changed by the next write operation.

Register bytes are sent MSB first.

9.3.2.5 Operation Mode

The TMP1075 can operate as a receiver or transmitter. As a target device, the TMP1075 never drives the SCL line.

9.3.2.5.1 Receiver Mode

The first byte transmitted by the host is the device address with the R/ $\overline{W}$ bit low. The TMP1075 then acknowledges reception of a valid address. The next byte transmitted by the host is the pointer register. The TMP1075 then acknowledges reception of the pointer register byte. The next byte or bytes are written to the register addressed by the pointer register. The TMP1075 acknowledges reception of each data byte. The host can terminate data transfer by generating a START or STOP condition.

9.3.2.5.2 Transmitter Mode

The first byte is transmitted by the host and is the device address, with the $R/\overline{W}$ bit high. The target device acknowledges reception of a valid device address. The next byte is transmitted by the device and is the most significant byte of the register indicated by the Pointer register. The host acknowledges reception of the data byte. The next byte transmitted by the device is the least significant byte. The host acknowledges reception of the data byte. The host can terminate data transfer by generating a Not-Acknowledge on reception of any data byte, or generating a START or STOP condition.

9.3.2.6 SMBus Alert Function

The TMP1075 supports the SMBus Alert function. When the TMP1075 is operating in interrupt mode ($TM = 1$), the ALERT pin of the TMP1075 can be connected as an SMBus Alert signal. When a host senses that an alert condition is present on the ALERT line, the host sends an SMBus Alert command (00011001) on the bus. If the ALERT pin of the TMP1075 is active, the devices acknowledge the SMBus Alert command and respond by returning the device address on the SDA line. The eighth bit (LSB) of the device address byte indicates if the temperature exceeding T_{HIGH} or falling below T_{LOW} caused the alert condition. This bit is equal to POL if the temperature is greater than or equal to T_{HIGH} . This bit is equal to $\overline{POL}$ if the temperature is less than T_{LOW} . See [Figure 9-8](#) for details of this sequence.

If multiple devices on the bus respond to the SMBus Alert command, arbitration during the device address portion of the SMBus Alert command determines which device clears the alert status. If the TMP1075 wins the arbitration, the ALERT pin becomes inactive at the completion of the SMBus Alert command. If the TMP1075 loses the arbitration, the ALERT pin remains active.

9.3.2.7 General Call- Reset Function

The TMP1075 responds to the two-wire general call address (0000 000) if the eighth bit is 0. The device acknowledges the general call address and responds to commands in the second byte. If the second byte is 00000 110, the TMP1075 resets the internal registers to the power-up reset values.

9.3.2.8 High-Speed Mode (HS)

For the two-wire bus to operate at frequencies above 400 kHz, the host device must issue an HS mode host code (00001XXX) as the first byte after a START condition to switch the bus to high-speed operation. The TMP1075 device does not acknowledge this byte, but it does switch the input filters on the SDA and SCL and the output filters on the SDA to operate in HS mode. After the HS mode host code is issued, the host transmits a two-wire device address to initiate a data transfer operation. The bus continues to operate in HS mode until a STOP condition occurs on the bus. Upon receiving the STOP condition, the TMP1075 switches the input and output filters back to fast-mode operation.

9.3.2.9 Coexists in I³C Mixed Fast Mode

A bus with both I³C and I²C interfaces is referred to as a mixed fast mode with clock speeds up to 12.5 MHz. In order for the TMP1075, which is an I²C device, to coexist in the same bus, the device incorporated a spike suppression filter of 50 ns on the SDA and SCL pins to avoid any interference to the bus when communicating with I³C devices.

9.3.2.10 Time-Out Function

The TMP1075 resets the serial interface if SCL is held low by the host or SDA is held low by the TMP1075 for 25 ms (TMP1075N: 30 ms) (typical) between a START and STOP condition. The TMP1075 releases the SDA bus and waits for a START condition. To avoid activating the time-out function, a communication speed of at least 1 kHz must be maintained.

9.3.3 Timing Diagrams

The TMP1075 is two-wire SMBus and I²C interface-compatible. [Figure 9-3](#) to [Figure 9-8](#) describe the various operations on the TMP1075. The following list provides bus definitions.

Bus Idle: Both SDA and SCL lines remain high.

Start Data Transfer: A change in the state of the SDA line from high to low when the SCL line is high defines a START condition. Each data transfer is initiated with a START condition.

Stop Data Transfer: A change in the state of the SDA line from low to high when the SCL line is high defines a STOP condition. Each data transfer is terminated with a repeated START or STOP condition.

Data Transfer: The number of data bytes transferred between a START and a STOP condition is not limited and is determined by the host device. The receiver acknowledges the transfer of data.

Acknowledge: Each receiving device, when addressed, is obliged to generate an Acknowledge bit. A device that acknowledges must pull down the SDA line during the Acknowledge clock pulse in such a way that the SDA line is stable low during the high period of the Acknowledge clock pulse. Setup and hold times must be taken into account. On a host receive, the termination of the data transfer can be signaled by the host generating a Not-Acknowledge on the last byte that is transmitted by the target device.

9.4 Device Functional Modes

9.4.1 Shutdown Mode (SD)

Shutdown mode (SD) of the TMP1075 device allows the user to conserve power by shutting down all device circuitry except the serial interface, which significantly reduces the current consumption. SD is initiated when the SD bit in the configuration register is set to 1. When SD is equal to 0, the device stays in continuous conversion mode.

9.4.2 One-Shot Mode (OS)

The TMP1075 features a one-shot mode (OS) temperature measurement. When the device is in shutdown mode, writing 1 to the OS bit starts a single temperature conversion. The device returns to the shutdown state at the completion of the single conversion. This feature is useful to reduce power consumption in the TMP1075 when continuous temperature monitoring is not required.

When the configuration register is read, the OS bit always reads 0 on TMP1075 non-N orderables. On the TMP1075N orderable, the OS bit reads back 0 during the one-shot conversion and 1 after the conversion cycle.

9.4.3 Continuous Conversion Mode (CC)

When the device is operating in continuous conversion mode (SD=0), every conversion cycle consists of an active conversion, followed by a standby (see 9-9). The device consumes a higher current during an active conversion, and lower current during standby. Active conversion time is 5.5 ms (TMP1075N: 23 ms) before the part goes in standby. 表 9-8 shows the list of conversion cycle configured using [R1:R0] bits in the configuration register.

9-9. Conversion Rate Diagram

9.4.4 Thermostat Mode (TM)

The thermostat mode bit indicates whether ALERT pin operates in comparator mode (TM = 0) or interrupt mode (TM = 1). ALERT pin mode is controlled by TM (bit 9) of the configuration register. Any write to the TM bit changes the ALERT pin to a none active condition, clears the faults count, and clears the alert interrupt history on the TMP1075 non-N orderables. The ALERT pin can be disabled in both comparator and interrupt modes if both limit registers are set to the rail values $T_{LOW} = -128^{\circ}\text{C}$ and $T_{HIGH} = +127.9375^{\circ}\text{C}$ on the TMP1075 non-N orderables.

9.4.4.1 Comparator Mode (TM = 0)

In comparator mode (TM = 0), the ALERT pin becomes active when the temperature equals or exceeds the value in T_{HIGH} for a consecutive number of Fault Queue bits [F1:F0]. The ALERT pin remains active until the temperature falls below the indicated T_{LOW} value for the same number of faults.

The difference between the two limits acts as a hysteresis on the comparator output, and a fault counter prevents false alerts as a result of system noise. The SMBus Alert response function is ignored in the comparator mode.

9.4.4.2 Interrupt Mode (TM = 1)

In interrupt mode (TM = 1), the device starts to compare temperature readings with the high limit register value. The ALERT pin becomes active when the temperature equals or exceeds T_{HIGH} for a consecutive number of conversions as set by the Fault Queue bits [F1:F0]. The ALERT pin remains active until it is cleared by one of three events: a read of any register, a successful SMBus Alert response, or a shutdown command. After the ALERT pin is cleared, the device starts to compare temperature readings with the T_{LOW} . The ALERT pin becomes active again only when the temperature drops below T_{LOW} for a consecutive number of conversions as set by the Fault Queue bits. The ALERT pin remains active until cleared by any of the same three clearing events. After the ALERT pin is cleared by one of the events, the cycle repeats and the device resumes to compare the temperature to T_{HIGH} . The interrupt mode history is cleared by a change in the TM=0 bit, setting the device to SD mode, or resetting the device on the TMP1075 non-N orderables.

9.4.4.3 Polarity Mode (POL)

The polarity bit allows the user to adjust the polarity of the ALERT pin output. If the POL bit is set to 0 (default), the ALERT pin becomes active low. When POL bit is set to 1, the ALERT pin becomes active high and the state of the ALERT pin is inverted. [Figure 9-10](#) shows the operation of the ALERT pin in various modes.

9.5.1.1 Temperature Register (address = 00h) [default reset = 0000h]

The temperature register of the TMP1075 is a 12-bit, read-only register that stores the result of the most recent conversion (see [Figure 9-11](#)). Data is represented in binary two's complement format. The first 12 bits are used to indicate temperature, with all remaining bits equal to zero. The least significant byte does not have to be read if that information is not needed. Following power-up or reset, the temperature register value is 0°C until the first conversion is complete.

9.5.1.2 Configuration Register (address = 01h) [default reset = 00FFh (60A0h TMP1075N)]

The configuration register is an 16-bit read/write register used to store bits that control the operational modes of the temperature sensor. Read and write operations are performed MSB first. [Figure 9-12](#) shows the format of the configuration register for the TMP1075, followed by a breakdown of the register bits. The power-up or reset value of the configuration register are all bits equal to 00FFh (TMP1075N: 60A0h). Only single byte writes and reads must be used when pointing to the configuration register for proper operation on the TMP1075N orderable.

7:0	—	R/W	FFh A0h (TMP1075N)	Not used Reserved on TMP1075N package

Note

The configuration register supports single-byte read and write over I²C bus to ensure software compatibility with other xx75 standard temperature sensors like TMP75 and LM75. When a single byte write is performed, the data byte on the I²C bus updates the register bits 15-8. Similarly when a single byte read is performed, the data bits 15-8 is transferred over the I²C bus.

9.5.1.3 Low Limit Register (address = 02h) [default reset = 4B00h]

The register is configured as a 12-bit, read/write register and data is represented in two's complement format. [Figure 9-14](#) shows the layout for T_{LOW} is the same as the temperature register. The default reset value is 4B00h and corresponds to 75°C.

10 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

10.1 Application Information

The TMP1075 can measure the PCB temperature of the location where the user mounts the device. The TMP1075 features two-wire SMBus and I²C interface compatibility, with the TMP1075 allowing up to 32 (TMP1075N: 4) devices on one bus. The TMP1075 requires a pullup resistor on the SDA pin, and if needed, on the SCL and ALERT pins. A 0.01-μF bypass capacitor is also required (see [Figure 10-1](#)).

10.2 Typical Application

Figure 10-1. Typical Connections

10.2.1 Design Requirements

The recommended value for the pullup resistor is 5 kΩ. In some applications, the pullup resistor can be lower or higher than 5 kΩ, but the maximum current through the pullup current is recommended to not exceed 3 mA on the SCL and SDA pins. The SCL, SDA, A0, and A1, lines can be pulled up to a supply that is higher than V+. The ALERT line can be pulled up to a supply higher than V+ on the TMP1075 non-N orderables. The A2 pin can only be connected to GND or V+. When the ALERT pin is not used, it can either be connected GND or left floating.

10.2.2 Detailed Design Procedure

Place the TMP1075 device in close proximity to the heat source that must be monitored with a proper layout for good thermal coupling. This placement ensures that temperature changes are captured within the shortest possible time interval. To maintain accuracy in applications that require air or surface temperature measurement, take care to isolate the package and leads from ambient air temperature. A thermally-conductive adhesive is helpful in achieving accurate surface temperature measurement.

10.2.2.1 Migrating From the xx75 Device Family

The TMP1075 is designed specifically to be a pin-to-pin compatible replacement with xx75 family of devices. This includes considerations for software compatibility. The two byte registers of the TMP1075 dynamically support single byte read or write, meaning that replacing older xx75 standard temperature sensors should not require any updates to existing code.

10.2.3 Application Curve

For application curves, see [表 10-1](#):

表 10-1. Table of Graphs

FIGURE	TITLE
 8-9	Sampling Period Change vs. Temperature (1.7 V to 5.5 V)

11 Power Supply Recommendations

The TMP1075 D, DGK, and DSG packages operate with a power supply in the range of 1.7 V to 5.5 V (TMP1075N DRL package operates from 1.62 V to 3.6 V). A power-supply bypass capacitor is required for precision and stability. Place this power-supply bypass capacitor as close to the supply and ground pins of the device as possible. A typical value for this supply bypass capacitor is 0.01 μ F. Applications with noisy or high-impedance power supplies can require a bigger bypass capacitor to reject power-supply noise.

To minimize device self-heating and improve temperature precision, it is recommended to:

- Use the minimum supply voltage rail available
- Avoid communication over I²C bus during ADC conversion
- Use one-shot mode to minimize power consumption
- Set I²C signal levels V_{IL} close to ground and V_{IH} above 90% of V+
- Maintain the I2C bus signals positive edge less than 1 μ s by using a pull-up resistor < 10 k Ω
- Connect the address pins A₀ and A₁ to either ground or V+

12 Layout

12.1 Layout Guidelines

Place the power-supply bypass capacitor as close to the supply and ground pins as possible. The recommended value of this bypass capacitor is 0.01 μF . Pullup the open-drain output pins SDA and ALERT through 5-k Ω pullup resistors. The SCL requires a pullup resistor only if the microprocessor output is open drain.

13 Device and Documentation Support

13.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](https://www.ti.com). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

13.2 サポート・リソース

[TI E2E™ サポート・フォーラム](#)は、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

リンクされているコンテンツは、該当する貢献者により、現状のまま提供されるものです。これらは TI の仕様を構成するものではなく、必ずしも TI の見解を反映したものではありません。TI の[使用条件](#)を参照してください。

13.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

すべての商標は、それぞれの所有者に帰属します。

13.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

13.5 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TMP1075DGKR	ACTIVE	VSSOP	DGK	8	2500	RoHS & Green	NIPDAUAG SN	Level-2-260C-1 YEAR	-55 to 125	1075	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
