

SNx5DP159 6Gbps、AC結合、TMDS™からHDMI™へのレベル・シフト・リタイマ

1 特長

- AC結合のTMDSまたはDisplayPortデュアル・モード物理レイヤ入力からHDMI2.0a TMDS物理レイヤ出力へ、最高6Gbpsのデータ速度をサポート、HDMI2.0aの電気的パラメータと互換
- DisplayPortのデュアル・モード標準バージョン1.1をサポート
- 適応型レシーバ・イコライザと、最高16.5dBにプログラム可能な固定イコライザ
- 高速レーン制御、プリエンファシスと送信スイング、スルー・レート制御
- I²Cまたはピン・ストラップによりプログラム可能
- Type-2 I2C-over-AUXからDDCへのブリッジをサポート
- 統合TMDSレベル変換器とCDR
- アクティブI²C[4]バッファ
- メイン・レーンの入カスワップ
- 低消費電力
- 低消費電力
 - アクティブ時6Gbpsで-435mW、シャットダウン状態で-10mW
- 拡張商業用および工業用の両方の温度のデバイス・オプション
- 40ピン、0.4mmピッチ、5mm×5mmのWQFNパッケージ、TPD158リドライバとピン互換
- 40ピン、0.5mmピッチ、7mm×7mmのWQFNパッケージ

2 アプリケーション

- ノートPC、デスクトップ、オール・イン・ワン、タブレット、ゲームおよび産業用PC
- オーディオ/ビデオ機器
- Blu-ray™DVD
- ゲーム機
- HDMIアダプタまたはドングル
- ドッキング・ステーション

3 概要

SNx5DP159デバイスはデュアル・モード[1]のDisplayPortからTMDS (Transition-Minimized Differential Signal)へのリタイマで、DVI (Digital Video Interface) 1.0およびHDMI (High-Definition Multimedia Interface) 1.4bおよび2.0出力信号をサポートします。SNx5DP159デバイスは、DDCリンクまたはAUXチャンネルにより、デュアル・モード標準バージョン1.1 type 1およびtype 2をサポートします。SNx5DP159デバイスは、データ・レーンごとに最高6Gbpsのデータ速度をサポートし、カラーごとに8ビットの高解像度Ultra HD (4K×2K/60Hz)ビデオ、および1080p (1920×1080/60Hz)で16ビット・カラー深度のHDTVをサポートします。SNx5DP159デバイスは、データ速度が1Gbps未満のときはリドライバとして、データ速度がそれ以上の場合はリタイマとして、自動的に自己構成可能です。この機能は、I²C[4]のプログラムによりオフにできます。

製品情報⁽¹⁾

型番	パッケージ	本体サイズ(公称)
SN65DP159	VQFN (48)	7.00mm×7.00mm
SN75DP159	WQFN (40)	5.00mm×5.00mm

(1) 利用可能なすべてのパッケージについては、このデータシートの末尾にある注文情報を参照してください。

4 改訂履歴

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Revision E (April 2018) から Revision F に変更		Page
• 「概要(続き)」で「SN75DP159は-40°C～85°Cで動作が規定されています」を「SN65DP159は-40°C～85°Cで動作が規定されています」に変更.....		4
• 「概要(続き)」で「SN65DP159は0°C～85°Cで動作が規定されています」を「SN75DP159は0°C～85°Cで動作が規定されています」に変更.....		4
Revision D (June 2017) から Revision E に変更		Page
• Changed the pinout images appearance in the <i>Pin Configuration and Functions</i> section.....		5
Revision C (July 2016) から Revision D に変更		Page
• タイトルを「SNx5DP159 6Gbps、DP++からHDMI™へのリタイマ」から「SNx5DP159 6Gbps、AC結合、TMDS™からHDMI™へのレベル・シフタ・リタイマ」に変更.....		1
• 「特長」の一覧を変更.....		1
• 「アプリケーション」の一覧を変更.....		1
• V _{SADJ} : Added Note: "Best transmit eye ..", added MIN and MAX values in the <i>Recommended Operating Conditions</i> table.....		9
• Changed the description of t _{d1} in 表 1.....		27
• Changed read procedures in the <i>I²C Control Behavior</i> section.....		35
• Added paragraph: "DP159 is designed..." to the <i>Application and Implementation</i> section.....		41
• Added 2 paragraphs to the <i>Application Information</i> section.....		41

- Added line item "Adding pre-emphasis will improve..." to the *Detailed Design Procedure* section 47

Revision B (April 2016) から Revision C に変更 **Page**

- [Recommended Operating Conditions](#), Changed the CONTROL PINS section 9
- Changed the [AUX, DDC, and I²C Electrical Characteristics](#) table 13
- Added text to [図 31](#) Note: "The SCL_SRC and SDA_SRC pins must be pulled to ground." 43

Revision A (July 2015) から Revision B に変更 **Page**

- Added "Low-level input voltage at OE" to V_{IL} in the [Recommended Operating Conditions](#) table 9
- Added OE to V_{IH} "High-level input voltage" in the [Recommended Operating Conditions](#) table 9
- Changed [図 22](#) 26
- Deleted the VDD_ramp and VCC_ramp MIN values in [表 1](#) 27
- Changed text "through the I²C interface" To: "through the I²C access on the DDC interface" in [DDC Functional Description](#) 32
- Changed the HDMI and DVI value for 1Ah [表 3](#) 33
- Added Note to 11–400-kbps in [表 7](#) 37
- Changed the note in the DEV_FUNC_MODE section of [表 7](#) 37
- Changed Note in the DDC_TRAIN_SET section of [表 8](#) 38

2015年7月発行のものから更新 **Page**

- デバイスのステータスを「製品プレビュー」から「量産データ」に更新 1
- 標準的な消費電力の数値を更新 1
- スタンバイ時消費電力を削除 1
- 「プレビュー」から「量産データ」に変更 1
- Replaced SIG_EN with NC in pinout drawing and *Pin Functions* table 5
- Removed lane swap from description of SWAP/POL = H 8
- Updated swing data 9
- Changed DDC link into its pin names between SNK and SRC and updated min value 9
- Added new line for SCL_SNK, SDA_SNK 9
- Removed standby power and standby current rows and updated active power and current numbers 10
- Changed term control to no source termination 12
- Increased I_{LEAK} max value from 10 μA to 45 μA 12
- Updated redriver mode max jitter value 14
- Clarified polarity swap to input signals 28
- Added more information on compliance in redriver mode 32
- Added note to *DDC Functional Description* section describing DDC snoop function 32
- Removed bit 4 SIG_EN and made reserved 37
- Removed SIG_EN Pin and added Note 1 for DDC Snoop 43
- Updated schematic to replace SIG_EN pin with NC 44
- Updated VID swing 47
- Changed Title to better match table. Removed Standby and redundant rows 49
- Updated drawing with pin 17 changed to NC 52

5 概要 (続き)

信号の整合性のため、SNx5DP159デバイスにはいくつかの機能が実装されています。SNx5DP159レシーバは適応型と固定の両方のイコライゼーションをサポートし、シンボル間干渉(ISI)ジッタや、帯域幅の制限された基板配線やケーブルによる損失をクリーンアップできます。リタイマとして動作するとき、組み込みのクロック・データ・リカバリ(CDR)により、ビデオ・ソース入力の高周波とランダムなジッタがクリーンアップされます。トランスミッタには、コンプライアンスに適合し、ディエンファシスなどシステム・レベルの設計の問題を低減するためいくつかの機能があり、長いケーブルや損失の大きい基板配線を駆動するときの減衰を補償します。SNx5DP159デバイスには、Vsadjピンの外付け抵抗によるTMDS出力振幅設定、ソース終端の選択、および出力スルー・レート制御機能も搭載されています。デバイスの動作および構成は、ピン・ストラッピングまたはI²C[4]によりプログラム可能です。

SNx5DP159デバイスには、電力管理およびアクティブな消費電力削減のため、いくつかの手法が実装されています。

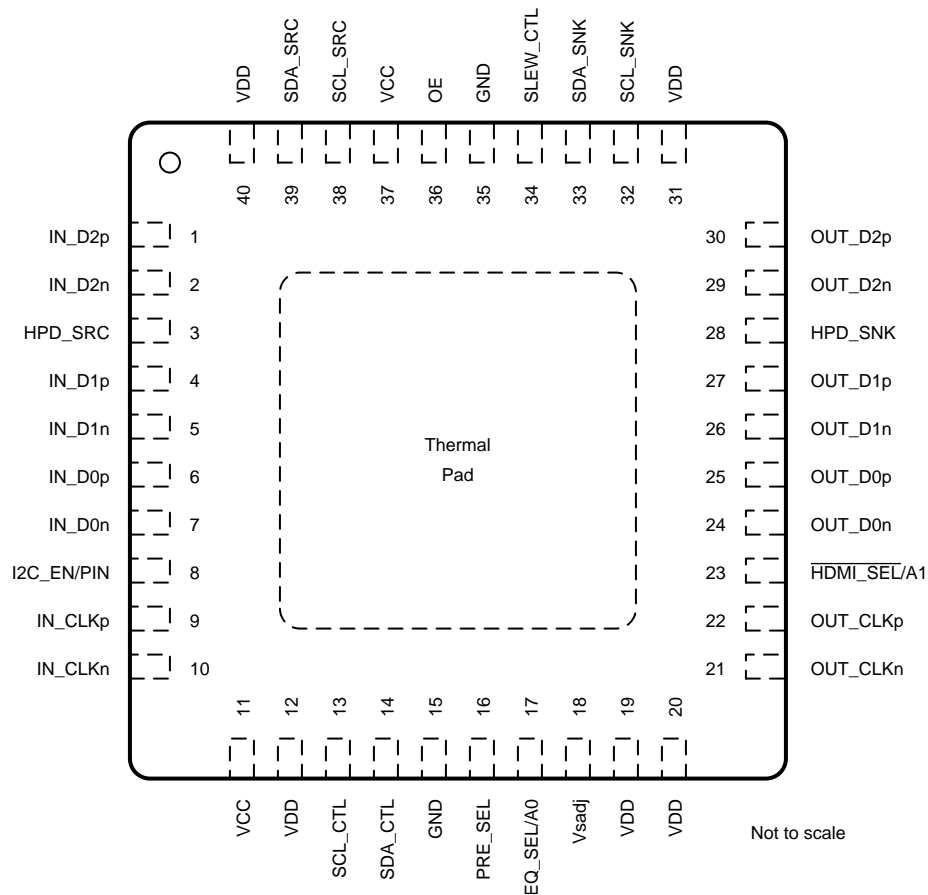

SNx5DP159レシーバはいくつかの手法を使用して、アプリケーションがHDMI1.4b[2]またはHDMI2.0[3]のデータ速度をサポートしているかどうかを判定します。SNx5DP159レシーバは、スペースに制約のあるアプリケーション向けの40ピンRSBと、ドングルなどのアプリケーションに使用するための、DisplayPortデュアル・モード標準バージョン1.1の完全な機能セットをサポートする48ピンRGZバージョンの2つのパッケージで供給されます。

SN65DP159デバイスは、工業用動作温度範囲の-40°C～85°Cで動作が規定されています。

SN75DP159デバイスは、拡張商業用動作温度範囲の0°C～85°Cで動作が規定されています。

6 Pin Configuration and Functions

Pin Functions

PIN ⁽¹⁾			I/O	DESCRIPTION ⁽²⁾
SIGNAL NAME	RGZ	RSB		
MAIN LINK INPUT PINS (FAIL SAFE)				
IN_D2p	2	1	I	Channel 2 differential input
IN_D2n	3	2		
IN_D1p	5	4	I	Channel 1 differential input
IN_D1n	6	5		
IN_D0p	8	6	I	Channel 0 differential input
IN_D0n	9	7		
IN_CLKp	11	9	I	Clock differential input
IN_CLKn	12	10		
MAIN LINK OUTPUT PINS (FAIL SAFE)				
OUT_D2n	34	29	O	TMDS data 2 differential output
OUT_D2p	35	30		
OUT_D1n	31	26	O	TMDS data 1 differential output
OUT_D1p	32	27		

(1) Blue pin names are only in the SNx5DP159 RGZ package.

(2) (H) Logic high (pin strapped to VCC through 65-kΩ resistor); (L) logic low (pin strapped to GND through 65-kΩ resistor); (for mid-level, no connect)

Pin Functions (continued)

PIN ⁽¹⁾			I/O	DESCRIPTION ⁽²⁾
SIGNAL NAME	RGZ	RSB		
OUT_D0n	28	24	O	TMDS data 0 differential output
OUT_D0p	29	25		
OUT_CLKn	25	21	O	TMDS data clock differential output
OUT_CLKp	26	22		
HOT PLUG DETECT PINS				
HPD_SRC	4	3	O	Hot plug detect output
HPD_SNK	33	28	I (Failsafe)	Hot plug detect input
AUXILIARY/DDC DATA PINS				
AUX_SRCp	45	N/A	I/O	Source side bidirectional DisplayPort auxiliary for I ² C-over-AUX (DP159RGZ only)
AUX_SRCn	44	N/A		
SDA_SRC	47	39	I/O (Failsafe)	Source side TMDS port bidirectional DDC data line
SCL_SRC	46	38		
SDA_SNK	39	33	I/O (Failsafe)	Sink side TMDS port bidirectional DDC data lines
SCL_SNK	38	32		
CONTROL PINS				
OE	42	36	I	Operation enable/reset pin OE = L: Power-down mode OE = H: Normal operation Internal weak pullup: Resets device when transitions from H to L
NC ⁽¹⁾	17	N/A	I	No connect
CEC_EN ⁽¹⁾	18	N/A	O	CEC control pin for Dongle applications
SLEW_CTL	40	34	I 3 level ⁽²⁾	Slew rate control when I ² C_EN/PIN = Low. SLEW_CTL = H, fastest data rate SLEW_CTL = L, 5 ps slow SLEW_CTL = No Connect, 10 ps slow When I ² C_EN/PIN = High Slew rate is controlled through I ² C[4]
PRE_SEL	20	16	I 3 level ⁽²⁾	De-emphasis pin strap when I ² C_EN/PIN = Low. PRE_SEL = L: - 2 dB de-emphasis PRE_SEL = No Connect: 0 dB PRE_SEL = H: Reserved
EQ_SEL/A0	21	17	I 3 level ⁽²⁾	Input Receive Equalization pin strap when I ² C_EN/PIN = Low EQ_SEL = L: Fixed EQ at 7.5 dB EQ_SEL = No Connect: Adaptive EQ EQ_SEL = H: Fixed at 14 dB When I ² C_EN/PIN = High Address bit 1 Note: (3 level for pin strap programming but 2 level when I ² C[4] address)
I ² C_EN/PIN	10	8	I	I ² C_EN/PIN = High; puts device into I ² C control mode I ² C_EN/PIN = Low; puts device into pin strap mode
SCL_CTL	15	13	I	I ² C clock signal Note: When I ² C_EN/PIN = Low Pin strapping take priority and those functions cannot be changed by I ² C
SDA_CTL	16	14	I/O	I ² C data signal Note: When I ² C_EN/PIN = Low Pin strapping take priority and those functions cannot be changed by I ² C
Vsadj	22	18	I	TMDS-compliant voltage swing control nominal resistor to GND
HDMI_SEL/A1	27	23	I	HDMI_SEL when I ² C_EN/PIN = Low HDMI_SEL = High: Device configured for DVI HDMI_SEL = Low: Device configured for HDMI (Adaptor ID block is readable through I ² C[4] or I ² C-over-AUX. When I ² C_EN/PIN = High Address bit 2 Note: Weak internal pull down
TX_TERM_CTL ⁽¹⁾	36	N/A	I 3 level ⁽²⁾	Transmit Termination Control when I ² C_EN/PIN = Low TX_TERM_CTL = H, No transmit termination TX_TERM_CTL = L, Transmit termination impedance in 75 to about 150 Ω TX_TERM_CTL = No Connect, automatically selects the termination impedance Data rate (DR) > 3.4 Gbps – 75- to 150-Ω differential near end termination 2 Gbps < DR < 3.4 Gbps – 150- to 300-Ω differential near end termination DR < 2 Gbps – no termination Note: If left floating will be in automatic select mode.

Pin Functions (continued)

PIN ⁽¹⁾			I/O	DESCRIPTION ⁽²⁾
SIGNAL NAME	RGZ	RSB		
SWAP/POL ⁽¹⁾	1	N/A	I 3 level ⁽²⁾	Input lane SWAP and polarity control pin when I2C_EN/PIN = Low SWAP/POL = H receive lane polarity swap (retimer mode only) SWAP/POL = L receive lanes swap (retimer and redriver mode) SWAP/POL = No Connect normal working
SUPPLY AND GROUND PINS				
V _{CC}	13, 43	11, 37	P	3.3-V power supply
V _{DD}	14, 23, 24, 37, 48	12, 19, 20, 31, 40	P	1.1-V power supply
GND	7, 19, 41, 30,	15, 35	G	Ground
Thermal Pad				Connected to ground

7 Specifications

7.1 Absolute Maximum Ratings

 over operating free-air temperature (unless otherwise noted)⁽¹⁾⁽²⁾

		MIN	MAX	UNIT
Supply voltage ⁽³⁾	V _{CC}	-0.3	4	V
	V _{DD}	-0.3	1.4	V
Voltage	Main link input (IN_Dx AC-coupled mode), AUX_SRCp, AUX_SRCn differential voltage		1.56	V
	TMDS outputs (OUT_Dx)	-0.3	4	V
	HPD_SRC, Vsadj, SDA_CTL, SCL_CTL, OE, HDMI_SEL/A1, EQ_SEL/A0, I2C_EN/PIN, SLEW_CTL, TX_TERM_CTL, SDA_SRC, SCL_SRC	-0.3	4	V
	HPD_SNK, SDA_SNK, SCL_SNK	-0.3	6	V
Continuous power dissipation		See Thermal Information		
Storage temperature, T _{stg}		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values, except differential voltages, are with respect to network ground terminal.
- (3) Tested in accordance with JEDEC Standard 22, Test Method A114-B.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±500	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
GENERAL PARAMETERS					
V_{CC}	Supply voltage	3	3.3	3.6	V
V_{DD}		1.00	1.1	1.27	
T_{CASE}	Case temperature for RSB package			93.5	°C
T_{CASE}	Case temperature for RGZ package			92.7	°C
T_A	Operating free-air temperature	SN75DP159		85	°C
		SN65DP159	-40	85	
MAIN LINK DIFFERENTIAL PINS					
V_{ID_PP}	Peak-to-peak input differential voltage	75		1200	mv
V_{IC}	Input common mode voltage	0		2	V
C_{AC}	AC coupling capacitance	75	100	200	nF
d_R	Data rate	0.25		5	Gbps
V_{SADJ}	TMD5-compliant swing voltage bias resistor ⁽¹⁾	4.5	7.06	7.5	k Ω
CONTROL PINS					
V_{I_DC}	DC input voltage	Control pins		3.6	V
$V_{IL}^{(2)}$	Low-level input voltage at OE			0.8	V
	Low-level input voltage at SLEW_CTL, PRE_SEL, EQ_SEL/A0, TX_TERM_CTL, SWAP/POL			0.3	
$V_{IM}^{(2)}$	No connect input voltage at SLEW_CTL, PRE_SEL, EQ_SEL/A0, TX_TERM_CTL, SWAP/POL	1	1.2	1.4	V
$V_{IH}^{(2)}$	High-level input voltage at SLEW_CTL, OE ⁽³⁾ , PRE_SEL, EQ_SEL/A0, TX_TERM_CTL, SWAP/POL	2.6			V
V_{OL}	Low-level output voltage			0.4	V
V_{OH}	High-level output voltage	2.4			V
I_{IH}	High-level input current	-30		30	μ A
I_{IL}	Low-level input current	-10		10	μ A
I_{OS}	Short circuit output current	-50		50	mA
I_{OZ}	High impedance output current			10	μ A
R_{OEPU}	Pullup resistance on OE pin	150		250	k Ω

- (1) Best transmit eye with minimum intra-pair skew, largest vertical and horizontal eye opening, maintaining HDMI compliant output swing can be achieved with resistors around 6.4k. Using smaller resistors may lead to compliance failures.
- (2) These values are based upon a microcontroller driving the control pins. The pullup/pulldown/floating resistor configuration will set the internal bias to the proper voltage level which will not match the values shown here.
- (3) This value is based upon a microcontroller driving the OE pin. A passive reset circuit using an external capacitor and the internal pullup resistor will set OE pin properly, but may have a different value than shown due to internal biasing.

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		SNx5DP159	SNx5DP159	UNIT
		RGZ (VQFN)	RSB (WQFN)	
		48 PINS	40 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	31.1	37.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance (High-K board ⁽²⁾)	18.2	23.1	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance (High-K board ⁽²⁾)	8.1	9.9	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.4	0.3	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	8.1	3.8	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	3.2	3.2	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
- (2) Test conditions for Ψ_{JB} and Ψ_{JT} are clarified in TI document [Semiconductor and IC Package Thermal Metrics](#).

7.5 Power Supply Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP ⁽¹⁾	MAX ⁽²⁾	UNIT
P _{DD1}	Device power dissipation (Retimer operation)	OE = H, V _{CC} = 3.3 V/3.6 V, V _{DD} = 1.1 V/1.27 V IN_Dx: V _{ID_PP} = 1200 mV, 6Gbps TMDS pattern, V _I = 3.3 V, I _{2C_EN} /PIN = L, PRE_SEL = H, EQ_CTL = H, SDA_CTL/CLK_CTL = 0 V, VS _{adj} = 7.06 kΩ		435	600	mW
P _{DD2}	Device power dissipation (Redriver operation)	OE = H, V _{CC} = 3.3 V/3.6 V, V _{DD} = 1.1 V/1.27 V IN_Dx: V _{ID_PP} = 1200 mV, 6Gbps TMDS pattern, V _I = 3.3 V, I _{2C_EN} /PIN = L, PRE_SEL = H, EQ_CTL = H, SDA_CTL/CLK_CTL = 0 V, VS _{adj} = 7.06 kΩ		215	400	mW
P _{SD1}	Device power in power down	OE = L, V _{CC} = 3.3 V/3.6 V, V _{DD} = 1.1 V/1.27 V, VS _{adj} = 7.06 kΩ		10	30	mW
I _{CC1}	VCC supply current (TMDS 6Gbps retimer mode)	OE = H, V _{CC} = 3.3 V/3.6 V, V _{DD} = 1.1V/1.27 V, VS _{adj} = 7.06 kΩ IN_Dx: V _{ID_PP} = 1200 mV, 6Gbps TMDS pattern I _{2C_EN} /PIN = L, PRE_SEL = H, EQ_CTL = H, SDA_CTL/CLK_CTL = 0 V, SLEW_CTL = H		35	50	mA
I _{DD1}	VDD supply current (TMDS 6Gbps retimer mode)	OE = H, V _{CC} = 3.3 V/3.6 V, V _{DD} = 1.1 V/1.27 V, VS _{adj} = 7.06 kΩ IN_Dx: V _{ID_PP} = 1200 mV, 6Gbps TMDS pattern I _{2C_EN} /PIN = L, PRE_SEL = H, EQ_CTL = H, SDA_CTL/CLK_CTL = 0 V, SLEW_CTL = H		295	325	mA
I _{CC2}	VCC supply current (TMDS 6Gbps redriver mode)	OE = H, V _{CC} = 3.3 V/3.465 V, V _{DD} = 1.1 V/1.27 V, VS _{adj} = 7.06 kΩ IN_Dx: V _{ID_PP} = 1200 mV, 6Gbps TMDS pattern I _{2C_EN} /PIN = L, PRE_SEL = H, EQ_CTL = H, SDA_CTL/CLK_CTL = 0 V, SLEW_CTL = H		8	20	mA
I _{DD2}	VDD supply current (TMDS 6Gbps redriver mode)	OE = H, V _{CC} = 3.3 V/3.465 V, V _{DD} = 1.1 V/1.27 V, VS _{adj} = 7.06 kΩ IN_Dx: V _{ID_PP} = 1200 mV, 6Gbps TMDS pattern I _{2C_EN} /PIN = L, PRE_SEL = H, EQ_CTL = H, SDA_CTL/CLK_CTL = 0 V, SLEW_CTL = H		170	250	mA
I _{SD1}	Power-down current	OE = L, V _{CC} = 3.3 V/3.465 V, V _{DD} = 1.1 V/1.27 V, VS _{adj} = 7.06 kΩ	3.3-V rail	2	5	mA
I _{SD1}	Power-down current	OE = L, V _{CC} = 3.3 V/3.465 V, V _{DD} = 1.1 V/1.27 V, VS _{adj} = 7.06 kΩ	1.1-V rail	3.5	10	

 (1) The typical rating is simulated at 3.3-V V_{CC} and 1.1-V V_{DD} and at 27°C temperature unless otherwise noted

 (2) The maximum rating is simulated at 3.6-V V_{CC} and 1.27-V V_{DD} and at 85°C temperature unless otherwise noted

7.6 Differential Input Electrical Characteristics

over recommended operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
D _{R_RX_DATA}	Ddata lanes data rate		0.25		6	Gbps
D _{R_RX_CLK}	Clock lanes clock rate		25		340	MHz
t _{RX_DUTY}	Input clock duty circle		40%	50%	60%	
t _{CLK_JIT}	Input clock jitter tolerance				0.3	Tbit
t _{DATA_JIT}	Input data jitter tolerance	Test the TTP2, see 10			150	ps
T _{RX_INTRA}	Input intra-pair skew tolerance	Test at TTP2 when DR = 1.6-Gbps, see 10	112			ps
T _{RX_INTER}	Input inter-pair skew tolerance				1.8	ns
E _{QH(D)}	Fixed EQ gain for data lane IN _D (0,1,2)n/p	EQ_SEL/A0 = H; Fixed EQ gain, test at 6-Gbps		15		dB
E _{QL(D)}	Fixed EQ gain for data lane IN _D (0,1,2)n/p	EQ_SEL/A0 = L; Fixed EQ gain, test at 6-Gbps		7.5		dB

9 Detailed Description

9.1 Overview

The SNx5DP159 device is a Dual Mode[1] DisplayPort retiming level shifter that supports data rates up to 6-Gbps for HDMI2.0a. The device takes in AC coupled HDMI/DVI signals and level shifts them to TMDS signals while compensating for loss and jitter through its receiver equalizer and retiming functions. The SNx5DP159 in default configuration should meet most system needs but also provides features that allow the system implementer flexibility in design. Programming can be accomplished through I²C[4] or pin strapping.

9.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

NOTE: **Black** pin names are common to both packages.
Blue pin names are only in the SNx5DP159 RGZ package.

9.3 Feature Description

9.3.1 Reset Implementation

When OE is de-asserted, control signal inputs are ignored; the Dual Mode^[1] DisplayPort inputs and outputs are high impedance. It is critical to transition the OE input from a low level to a high level after the V_{CC} supply has reached the minimum recommended operating voltage. Achieve this transition by a control signal to the OE input, or by an external capacitor connected between OE and GND. To ensure that the SNx5DP159 device is properly reset, the OE pin must be de-asserted for at least 100- μ s before being asserted. When OE is toggled in this manner the device is reset. This requires the device to be reprogrammed if it was originally programmed through I²C for configuration. When implementing the external capacitor, the size of the external capacitor depends on the power-up ramp of the V_{CC} supply, where a slower ramp-up results in a larger value external capacitor. Refer to the latest reference schematic for SNx5DP159; consider approximately 200-nF capacitor as a reasonable first estimate for the size of the external capacitor. Both OE implementations are shown in [Figure 20](#) and [Figure 21](#).

Figure 20. External Capacitor Controlled OE

Figure 21. OE Input from Active Controller

9.3.2 Operation Timing

SNx5DP159 starts to operate after the OE signal goes high (see [Figure 22](#), [Figure 23](#), and [Table 1](#)). Keeping OE low until V_{DD} and V_{CC} become stable avoids any timing requirements as shown in [Figure 22](#).

VDD_ramp	V_{DD} supply ramp-up requirements		100	ms
VCC_ramp	V_{CC} supply ramp-up requirements		100	ms

9.3.3 I²C-over-AUX to DDC Bridge (SNx5DP159 48-Pin Package Version Only)

The SNx5DP159 device incorporates the I²C-over-AUX to DDC bridge to support the DisplayPort Dual-Mode standard version 1.1. It enables the communication between source device and sink device through AUX channel. The bridge receives the request from source device in the I²C-over-AUX format and transfers it into DDC signal to sink device. When the sink device responds, the request in the DDC channel and bridge packages it into I²C-over-AUX and sends it back to the source device.

9.3.4 Input Lane Swap and Polarity Working

The SNx5DP159 device incorporates the swap function, which can set the input lanes in swap mode. The IN_D2 routes to the OUT_CLK position. The IN_D1 swaps with IN_D0. The swap function only changes the input pins; EQ setup follows new mapping. The SWAP/POL is pin 1 in the 48-pin RGZ package. For the RSB version, the user needs to control the register 0x09h bit 7 for SWAP enable. Lane swap is operational in both redriver and retimer mode.

表 2. Lane Swap⁽¹⁾

NORMAL OPERATION	SWAP = L OR CSR 0x09h BIT 7 IS 1'b1
IN_D2 → OUT_D2	IN_D2 → OUT_CLK
IN_D1 → OUT_D1	IN_D1 → OUT_D0
IN_D0 → OUT_D0	IN_D2 → OUT_D1
IN_CLK → OUT_CLK	IN_CLK → OUT_D2

(1) The output lanes never change. Only the input lanes change. See 图 24 and 图 25.

24. SNx5DP159 Swap Function for 48 Pins

25. SNx5DP159 Swap Function for 40 Pins

The SNx5DP159 can also change the polarity of the input signals. When SWAP/POL is high, the n and p pins on each lane will swap. Use Register 0x9h bit 6 to swap polarity using I²C. Polarity swap only works for retimer mode. When the device is in automatic redriver to retimer mode this only works when device is in retimer stage. If set and data rate falls below 1.0-Gbps in this mode the polarity function will be lost.

9.3.5 Main Link Inputs

Standard Dual Mode[1] DisplayPort terminations are integrated on all inputs with expected AC coupling capacitors on board prior to input pins. External terminations are not required. Each input data channel contains an adaptive or fixed equalizer to compensate for cable or board losses. The voltage at the input pins must be limited below the absolute maximum ratings. The input pins have incorporated failsafe circuits. The input pins can be polarity changed through the local I2C register or pin strapping.

9.3.6 Main Link Inputs Debug Tools

There are two methods for debugging a system making sure the inputs to the SNx5DP159 are valid. A TMD5 error checker is implemented that will increment an error counter per data lane. This allows the system implementer to determine how the link between the source and SNx5DP159 is performing on all three data lanes. See CSR Bit Field Definitions – RX PATTERN VERIFIER CONTROL/STATUS register in 表 10.

If a high error count is evident, the SNx5DP159 has the ability to provide the general eye quality. A tool is available that uses the I²C[4] link to download data that can be plotted for an eye diagram. This is available per data lane.

9.3.7 Receiver Equalizer

Equalizers are used to clean up inter-symbol interference (ISI) jitter or loss from the bandwidth-limited board traces or cables. The SNx5DP159 device supports both fixed receiver equalizer (redriver and retimer mode) and adaptive receive equalizer (retimer mode) by setting the EQ_SEL/A0 pin or through I²C using reg0Ah[5]. When the EQ_SEL/A0 pin is high, the EQ gain is fixed to 14-dB. The EQ gain will be 7.5-dB if the EQ_SEL/A0 pin is set low. The SNx5DP159 device operates in adaptive equalizer mode when EQ_SEL/A0 left floating. Using adaptive equalization the gain will be automatically adjusted based on the data rate to compensate for variable trace or cable loss. Using the local I²C[4] control, reg0Dh[5:1], the fixed EQ gain can be selected for both data and clock.

图 26. Adaptive EQ Gain Curve

9.3.8 Termination Impedance Control

HDMI2.0[3] standard requires the transmitter termination impedance should be between 75 to 150-Ω. Older versions of the HDMI standard required no source termination. For HDMI1.4b[2] when data rate over 2 Gbps, the output performance could be better if the termination value between 150 to 300-Ω which was allowed. The SNx5DP159 supports three different source termination impedances for HDMI1.4b[2] and HDMI2.0[3]. Pin 36, TX_TERM_CTL, offers a selection option to choose the output termination impedance value. This can be adjusted by I²C[4]; reg0Bh[4:3] TX_TERM_CTL.

9.3.9 TMDS Outputs

An 1% precision resistor, 7.06-k Ω , is recommended to be connected from Vsadj pin to ground to allow the differential output swing to comply with TMDS signal levels. The differential output driver provides a typical 10-mA current sink capability when no source term is enabled, which provides a typical 500-mV voltage drop across a 50- Ω termination resistor. As compliance testing is system dependant this resistor value can be adjusted.

图 27. TMDS Driver and Termination Circuit

Referring to 图 27, if both V_{CC} (device supply) and AVCC (sink termination supply) are powered, the TMDS output signals are high impedance when OE = low. The normal operating condition is that both supplies are active. A total of 33-mW of power is consumed by the terminations independent of the OE logical selection. When AVCC is powered on, normal operation (OE controls output impedance) is resumed. When the power source of the device is off and the power source to termination is on, the IO(off) (output leakage current) specification ensures the leakage current is limited 45- μ A or less.

The clock and data lanes V_{OD} can be changed through I²C[4] (see VSWING_CLK and VSWING_DATA in 表 8 for details). 图 3 shows the different output voltage based on different Vsadj resistor values.

9.3.9.1 Pre-Emphasis/De-Emphasis

The SNx5DP159 provides De-emphasis as a way to compensate for the ISI loss between the TMDS outputs and the receiver it is driving. There are two methods to implement this function. When in pin strapping mode the PRE_SEL pin controls this. The PRE_SEL pin provides -2-dB, or 0-dB de-emphasis, which allows output signal pre-conditioning to offset interconnect losses from the SNx5DP159 device outputs to a TMDS receiver. TI recommends setting PRE_SEL at 0 dB while connecting to a receiver through a short PCB route. When pulled to ground with a 65-k Ω resistor -2-dB can be realized, see 图 9. When using I²C, Reg0Ch[1:0] is used to make these adjustments.

As there are times true pre-emphasis may be the best solution there are two ways to accomplish this. If pin strapping is being use the best method is to reduce the Vsadj resistor value increasing the V_{OD} and then pulling the PRE_SEL pin to ground using the 65-k Ω resistor, see 图 28. If using I²C this can be accomplished using two methods. First is similar to pin strapping by adjusting the Vsadj resistor value and then implementing -2-dB de-emphasis. Second method is to set Reg0Ch[7:5] = 011 and the set Reg0Ch[1:0] = 01 which accomplishes the same pre-emphasis setting. See 图 29.

9.4 Device Functional Modes

9.4.1 Retimer Mode

Clock and data recovery circuits (CDR) are used to track, sample and retimer the equalized data bit streams. The CDRs are designed with loop bandwidth to minimize the amount of jitter transfer from the video source to the TMDS outputs. Input jitter within the CDR's PLL bandwidth, < 1-MHz, will be transferred to the TMDS outputs. Higher frequency jitter above the CDR loop bandwidth is attenuated, providing a jitter cleaning function to reduce the amount of high frequency jitter from the video source. The retimer is automatically activated at pixel clock above approximately 100-MHz when jitter cleaning is needed for robust operation. The retimer operates at about 1.0 to 6-Gbps DR supporting HDMI2.0[3]. At pixel clock frequency below about 100 MHz, the SNx5DP159 automatically bypasses the internal retimer and operates as a redriver. When the video source changes resolution, the internal retimer starts the acquisition process to determine the input clock frequency and acquire lock to the new data bit streams. During the clock frequency detection period and the retimer acquisition period (that last approximately 7-ms), the TMDS drivers can be kept active (default) or programmed to be disabled to avoid sending invalid clock or data to the downstream receiver.

9.4.2 Redriver Mode

The SNx5DP159 also has a redriver mode that can be enabled through I²C[4]; at offset address 0Ah bits 1:0 DEV_FUNC_MODE. When in this mode, the CDR and PLL are shut off, thus reducing power. Jitter performance is degraded as the device will now only compensate for ISI loss in the link. In redriver mode HDMI2.0[3] compliance is not guaranteed as skew compensation and retiming functions are disabled. Excessive random or phase jitter will not be compensated.

9.4.3 DDC Training for HDMI2.0 Data Rate Monitor

As part of discovery, the source reads the sink's E-EDID information to understand the sink's capabilities. Part of this read is HDMI forum vendor specific data block (HF-VSDB) MAX_TMDS_Character_Rate byte to determine the data rate supported. Depending upon the value, the source will write to slave address 0xA8 offset 0x20 bit1, TMDS_CLOCK_RATIO_STATUS. The SNx5DP159 snoops this write to determine the TMDS clock ratio and thus sets its own TMDS_CLOCK_RATIO_STATUS bit accordingly. If a 1 is written, then the TMDS clock is 1/40 of TMDS bit period. If a 0 is written, then the TMDS clock is 1/10 of TMDS bit period. The SNx5DP159 will always default to 1/10 of TMDS bit period unless a 1 is written to address 0xA8 offset 0x20 bit 1. When HPD_SNK is de-asserted, this bit is reset to default values. If the source does not write this bit the SNx5DP159 will not be configured for TMDS clock 1/40 mode in support of HDMI2.0. As the SNx5DP159 is in link but not recognized as part of the link it is possible that the source could read the sink EDID where this bit is set and does not re-write this bit. If the SNx5DP159 has entered a power down state this bit is cleared and does not reset on a read. To work properly the bit has to be set again with a write by the source.

9.4.4 DDC Functional Description

The SNx5DP159 solves sink- or source-level issues by implementing a master/slave control mode for the DDC bus. When the SNx5DP159 detects the start condition on the DDC bus from the SDA_SRC/SCL_SRC, it will transfer the data or clock signal to the SDA_SNK/SCL_SNK with little propagation delay. When SDA_SNK detects the feedback from the downstream device, the SNx5DP159 will pull up or pull down the SDA_SRC bus and deliver the signal to the source.

The DDC link defaults to 100 kbps, but can be set to various values including 400 kbps by setting the correct value to address 22h (see 表 3) through the I²C access on the DDC interface. The DDC lines are 5-V tolerant. The HPD_SRC goes to high impedance when VCC is under low power conditions, < 1.5-V.

注

The SNx5DP159 uses clock stretching for DDC transactions. As there are sources and sinks that do not perform this function correctly a system may not work correctly as DDC transactions are incorrectly transmitted/received. To overcome this a snoop configuration can be implemented where the SDA/SCL from the source is connected directly to the SDA/SCL sink. The SNx5DP159 will need its SDA_SNK and SCL_SNK pins connected to this link in order for the SNx5DP159 to configure the TMDS_CLOCK_RATIO_STATUS bit. Care must be taken when this configuration is being implemented as the voltage levels for DDC between the source and sink may be different, 3.3 V vs 5 V.

9.5 Register Maps

9.5.1 DP-HDMI Adaptor ID Buffer

The SNx5DP159 device includes the DP-HDMI adapter ID buffer for HDMI/DVI adaptor recognition, defined by the VESA DisplayPort Dual-Mode Standard Version 1.1, accessible by standard I²C[4] protocols through the DDC interface when the `HDMI_SEL/A1` pin is low. The DP-HDMI adapter buffer and extended DDC register for Type 2 capability is accessed at target addresses 80h (Write) and 81h (Read).

The DP-HDMI adapter buffer contains a read-only phrase DP-HDMI ADAPTOR<EOT> converted to ASCII characters, as shown in 表 3, and supports the WRITE command procedures (accessed at target address 80h) to select the subaddress, as recommended in the VESA DisplayPort Interoperability Guideline Adaptor Checklist Version 1.0 section 2.3.

The default I2C speed prior to software writing to this register is 100-Kbps. Illegal write value shall write register default (08h). This register sets the DDC output DR whether I ² C-over-AUX or straight DDC	08h	08h	Write/Read
23h-FFh	Reserved	00h	00h	Read

9.5.2 Local I²C Interface Overview

The SCL_CTL and SDA_CTL pins are used for I²C clock and I²C data respectively. The SNx5DP159 I²C interface conforms to the 2-wire serial interface defined by the I²C Bus Specification, Version 2.1 (January 2000), and supports the fast mode transfer up to 400 kbps.

The device address byte is the first byte received following the start condition from the master device. The 7-bit device address for the SNx5DP159 device decides by the combination of EQ_SEL/A0 and HDMI_SEL/A1. 表 4 clarifies the SNx5DP159 device target address.

表 4. I²C Device Address Description

A1/A0	SNx5DP159 I ² C Device Address								ADD
	7 (MSB)	6	5	4	3	2	1	0 (W/R)	
00	1	0	1	1	1	1	0	0/1	BC/BD
01	1	0	1	1	1	0	1	0/1	BA/BB
10	1	0	1	1	1	0	0	0/1	B8/B9
11	1	0	1	1	0	1	1	0/1	B6/B7

9.5.3 I²C Control Behavior

Follow this procedure to write to the SNx5DP159 device I²C registers:

1. The master initiates a write operation by generating a start condition (S), followed by the SNx5DP159 device 7-bit address and a zero-value W/R bit to indicate a write cycle.
2. The SNx5DP159 device acknowledges the address cycle by combination of A0 and A1.
3. The master presents the subaddress (I²C register within SNx5DP159 device) to be written, consisting of one byte of data, MSB-first.
4. The SNx5DP159 device acknowledges the subaddress cycle.
5. The master presents the first byte of data to be written to the I²C register.
6. The SNx5DP159 device acknowledges the byte transfer.
7. The master may continue presenting additional bytes of data to be written, with each byte transfer completing with an acknowledge from the SNx5DP159 .
8. The master terminates the write operation by generating a stop condition (P).

Follow this procedure to read the SNx5DP159 I²C registers:

1. The master initiates a write operation by generating a start condition (S), followed by the SNx5DP159 7-bit address and a zero-value W/R bit to indicate a write cycle.
2. The SNx5DP159 device acknowledges the address cycle by combination of A0 and A1.
3. The master presents the subaddress (I²C register within SNx5DP159 device) to be read, consisting of one byte of data, MSB-first.
4. The SNx5DP159 device acknowledges the subaddress cycle.
5. The master initiates a read operation by generating a start condition (S), followed by the SNx5DP159 7-bit address and a one-value W/R bit to indicate a read cycle.
6. The SNx5DP159 device acknowledges the address cycle.
7. The SNx5DP159 device transmits the contents of the memory registers MSB-first starting at the written subaddress.
8. The SNx5DP159 device will wait for either an acknowledge (ACK) or a not-acknowledge (NACK) from the master after each byte transfer; the I²C master acknowledges reception of each data byte transfer.
9. If an ACK is received, the SNx5DP159 device transmits the next byte of data.
10. The master terminates the read operation by generating a stop condition (P).

注

Upon reset, the SNx5DP159 sub-address will always be set to 0x00. When no subaddress is included in a read operation, the SNx5DP159 subaddress increments from previous acknowledged read or write data byte. If it is required to read from a subaddress that is different from the SNx5DP159 internal subaddress, a write operation with only a subaddress specified is needed before performing the read operation.

Refer to 表 6 for the SNx5DP159 device local I²C register descriptions. Reads from reserved fields return 0s and writes are ignored.

9.5.4 I²C Control and Status Registers

Reads from reserved fields return 0, and writes to read-only reserved registers are ignored. Writes to reserved registers, which are marked with 'W', produce unexpected behavior. All addresses not defined by this specification are considered reserved. Reads from these addresses return 0 and writes will be ignored.

9.5.4.1 Bit Access Tag Conventions

A table of bit descriptions is typically included for each register description that indicates the bit field name, field description, and the field access tags. The field access tags are described in [表 5](#).

表 5. Field Access Tags

ACCESS TAG	NAME	DESCRIPTION
R	Read	The field is read by software
W	Write	The field is written by software
S	Set	The field is set by a write of one. Writes of 0 to the field have no effect
C	Clear	The field is cleared by a write of 1. Writes of 0 to the field have no effect
U	Update	Hardware may autonomously update this field
NA	No access	Not accessible or not applicable

9.5.4.2 CSR Bit Field Definitions

9.5.4.2.1 ID Registers

表 6. ID Registers

ADDRESS	BIT	DESCRIPTION	ACCESS
00h:07h	7:0	DEVICE_ID These fields return a string of ASCII characters "DP159" followed by three space characters. Address 0x00 – 0x07 = {0x44"D", 0x50"P", 0x31"1", 0x35"5", 0x39"9", 0x20, 0x20, 0x20}	R
08h	7:0	REV_ID. This field identifies the device revision. 0000001 – DP159 revision 1	R

9.5.4.2.2 Misc Control
表 7. Misc Control

ADDRESS	BIT	DEFAULT	DESCRIPTION	ACCESS
09h	7	1'b0	SWAP_EN: This field enables swapping the input main link lanes 0 – Disable (default) 1 – Enable Note: field is loaded from SWAP/POL pin; Writes ignored when I2C_EN/PIN = 0	RWU
	6	1'b0	LANE_POLARITY: swaps the input data and clock lanes polarity. 0 – Disabled: No polarity swap 1 – Swaps the input data and clock lane polarity Note: field is loaded from SWAP/POL pin; Writes ignored when I2C_EN/PIN = 0. This feature is only valid when in retimer mode.	RWU
	5:4	2'b00	Reserved	R
	3	1'b0	PD_EN 0 – Normal working (default) 1 – Forced power-down by I ² C, lowest power state	RW
	2	1'b0	HPD_AUTO_PWRDWN_DISABLE 0 – Automatically enters power down mode based on HPD_SNK (default) 1 – Will not automatically enter power mode based upon HPD_SNK	RW
	1:0	2'b10	I2C_DR_CTL. I2C data rate supported for configuring device 00 – 5-kbps 01 – 10-kbps 10 – 100-kbps (default) 11 – 400-kbps (Note: HPD_AUTO_PWRDWN_DISABLE must be set before enabling 400 Kbps mode)	RW
0Ah	7	1'b0	Application Mode Selection 0 – Source (default) - Set the adaptive EQ mid point to between 6.5-dB and 7.5-dB 1 – Sink - Sets the adaptive EQ starting point to between 12-dB and 13-dB	RW
	6	1'b0	HPDSNK_GATE_EN: This field sets the functional relationship between HPD_SNK and HPD_SRC. 0 – HPD_SNK passed through to the HPD_SRC (default) 1 – HPD_SNK will not pass through to the HPD_SRC.	RW
	5	1'b1	EQ_ADA_EN: this field enables the equalizer working state. 0 – Fixed EQ 1 – Adaptive EQ (default) Writes are ignored when I2C_EN/PIN = 0	RWU
	4	1'b1	EQ_EN: this field enables the receiver equalizer. 0 – EQ disabled 1 – EQ enable (default)	RW
	3	1'b1	AUX_BRG_EN: this field enable the AUX bridge working. This is only valid for the 48-pin package. 0 – AUX bridge disable 1 – AUX bridge enable (default)	RWU
	2	1'b0	APPLY_RXTX_CHANGES , Self clearing write-only bit. Writing a 1 to this bit will apply new slew, tx_term, twpst1, eqen, eqadapten, swing, eqftc, eqlev settings to the clock and data lanes. Writes to the respective registers do not take immediate effect. This bit does not need to be written if I ² C configuration occurs while OE or hpd_sink are low, I ² C power down is active.	W
	1:0	2'b01	DEV_FUNC_MODE: This field selects the device working function mode. 00 – Redriver mode across full range 250 Mbps to 6-Gbps 01 – Automatic redriver to retimer crossover at 1.0 Gbps (default) 10 - Automatic retimer for HDMI2.0 11 - Retimer mode across full range 250 Mbps to 6-Gbps When changing crossover point, need to toggle PD_EN or toggle external HPD_SNK.	RW

Mode Selection Definition: This bit lets the receiver know where the device is located in a system for the purpose of centering the AEQ point. The SNx5DP159 is targeting the source application, so the default value is 0, which will center the EQ at 6.5 to 7.5-dB depending upon TMDS_CLOCK_RATIO_STATUS value, see 表 9. If the SNx5DP159 is in a dock or sink application, the value should be changed to a value of 1, which will center the EQ at 12 to 13-dB depending upon TMDS_CLOCK_RATIO_STATUS value.

9.5.4.2.3 HDMI Control
表 8. HDMI Control

ADDRESS	BIT	DEFAULT	DESCRIPTION	ACCESS
0Bh	7:6	2'b00	SLEW_CTL. Slew rate control. 2'00 is fastest and 2'b11 is slowest Writes ignored when I2C_EN/PIN = 0	RWU
	5	1'b0	HDMI_SEL: Contro; Writes ignored when I2C_EN/PIN = 0 0 – HDMI (default) 1 – DVI	RWU
	4:3	2'b00	TX_TERM_CTL: Controls termination for HDMI TX 00 – No termination 01 – 150 to 300-Ω 10 – Reserved 11 – 75 to 150-Ω Note: Reflects the value of the TX_TERM_CTL pin; Writes ignored when I2C_EN/PIN = 0	RWU
	2	1'b0	Reserved	R
	1	1'b0	TMDS_CLOCK_RATIO_STATUS: This field is updated from snoop of I ² C write to slave address 0xA8 offset 0x20 bit 1 that occurred on the SDA_SRC/SCL_SRC interface. When bit 1 of address 0xA8 offset 0x20 is written to a 1'b1, then this field will be set to a 1'b1. When bit 1 of address 0xA8 offset 0x20 is written to a 1'b0, then this field will be set to a 1'b0. This field is reset to the default value whenever HPD_SNK is de-asserted for greater than 2 ms. 0 – TMDS clock is 1/10 of TMDS bit period (default) 1 – TMDS clock is 1/40 of TMDS bit period	RWU
	0	1'b0	DDC_TRAIN_SET: This field indicates the DDC training block function status. If disabled, the device can only work at the HDMI1.4b[2] or DVI mode 0 – DDC training enable (default) 1 – DDC training disable Note: To force TMDS_CLOCK_RATIO_STATUS to 1, this register bit must be set to 1 which will force the 1/40 mode for HDMI2.0.	RW
0Ch	7:5	3'b000	VSWING_DATA: Data output swing control 000 – V_{sadj} set 001 – Increase by 7% 010 – Increase by 14% 011 – Increase by 21% 100 – Decrease by 30% 101 – Decrease by 21% 110 – Decrease by 14% 111 – Decrease by 7%	RW
	4:2	3'b000	VSWING_CLK: Clock Output Swing Control 000 – V_{sadj} set 001 – Increase by 7% 010 – Increase by 14% 011 – Increase by 21% 100 – Decrease by 30% 101 – Decrease by 21% 110 – Decrease by 14% 111 – Decrease by 7% Note: Default is set by DR, which means standard based swing values but this allows for the swing to be overridden by selecting one of these values	RW
	1:0	2'b00	HDMI_TWPST1. HDMI de-emphasis FIR post-cursor-1 signed tap weight. 00 – No de-emphasis 01 – 2-dB de-emphasis 10 – Reserved 11 – Reserved	RWU

9.5.4.2.4 Equalization Control Register
表 9. Equalization Control Register

ADDRESS	BIT	DEFAULT	DESCRIPTION	ACCESS
0Dh	7:6	2'b00	Reserved	RW

10 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

DP159 is designed to accept AC coupled HDMI input signals. The device provides signal conditioning and level shifting functions to drive a compliant HDMI source connector. DP159 can be used as an DP1.2 retimer, follow application note [SLLA358](#) for required additional configuration. In many major PC or gaming platforms APU/GPU can provide AC coupled HDMI 2.0 signals, DP159 is suitable for such platforms.

10.1 Application Information

The DP159 was defined to work in mainly in source applications such as gaming systems, Blu-Ray DVD player, desktop, notebook or VR. The following sections provide design consideration for various types of applications.

10.1.1 Use Case of SNx5DP159

SNx5DP159 can be used on the motherboard and dongle applications. The following use case diagrams show the connection of AUX and DDC between source side and sink side. The control pin pull up and pull down resistors are shown from reference. If a high is needed only use the pull up. If a low is needed only use the pull down. If mid level is to be selected do not use either resistors and leave the pin floating/No connect. The 6.5-K Ω Vsadj resistor value shown is explained further in the compliance section, for the RSB package.

The DP159 was defined to work in mainly in source applications such as gaming systems, Blu-Ray DVD player, Desktop, Notebook or VR. The following sections provide design consideration for various types of applications.

[Figure 30](#) shows the original connection of SNx5DP159 on motherboard through the DDC channel. The DDC DR default is 100-kHz and is capable to adjust to 400-kHz.

Application Information (continued)

30. Implementation for Motherboard 1

Application Information (continued)

Figure 31 shows the connection for both DDC and AUX GPU connections with the SNx5DP159RGZ. Only one can be implemented at a time. Only the RGZ package supports the I²C-over-AUX implementation. The control pin pull up and pull down resistors are shown for reference. If a high is needed only use the pull up. If a low is needed only use the pull down. If mid level is to be selected do not use either resistors and leave the pin floating/No connect.

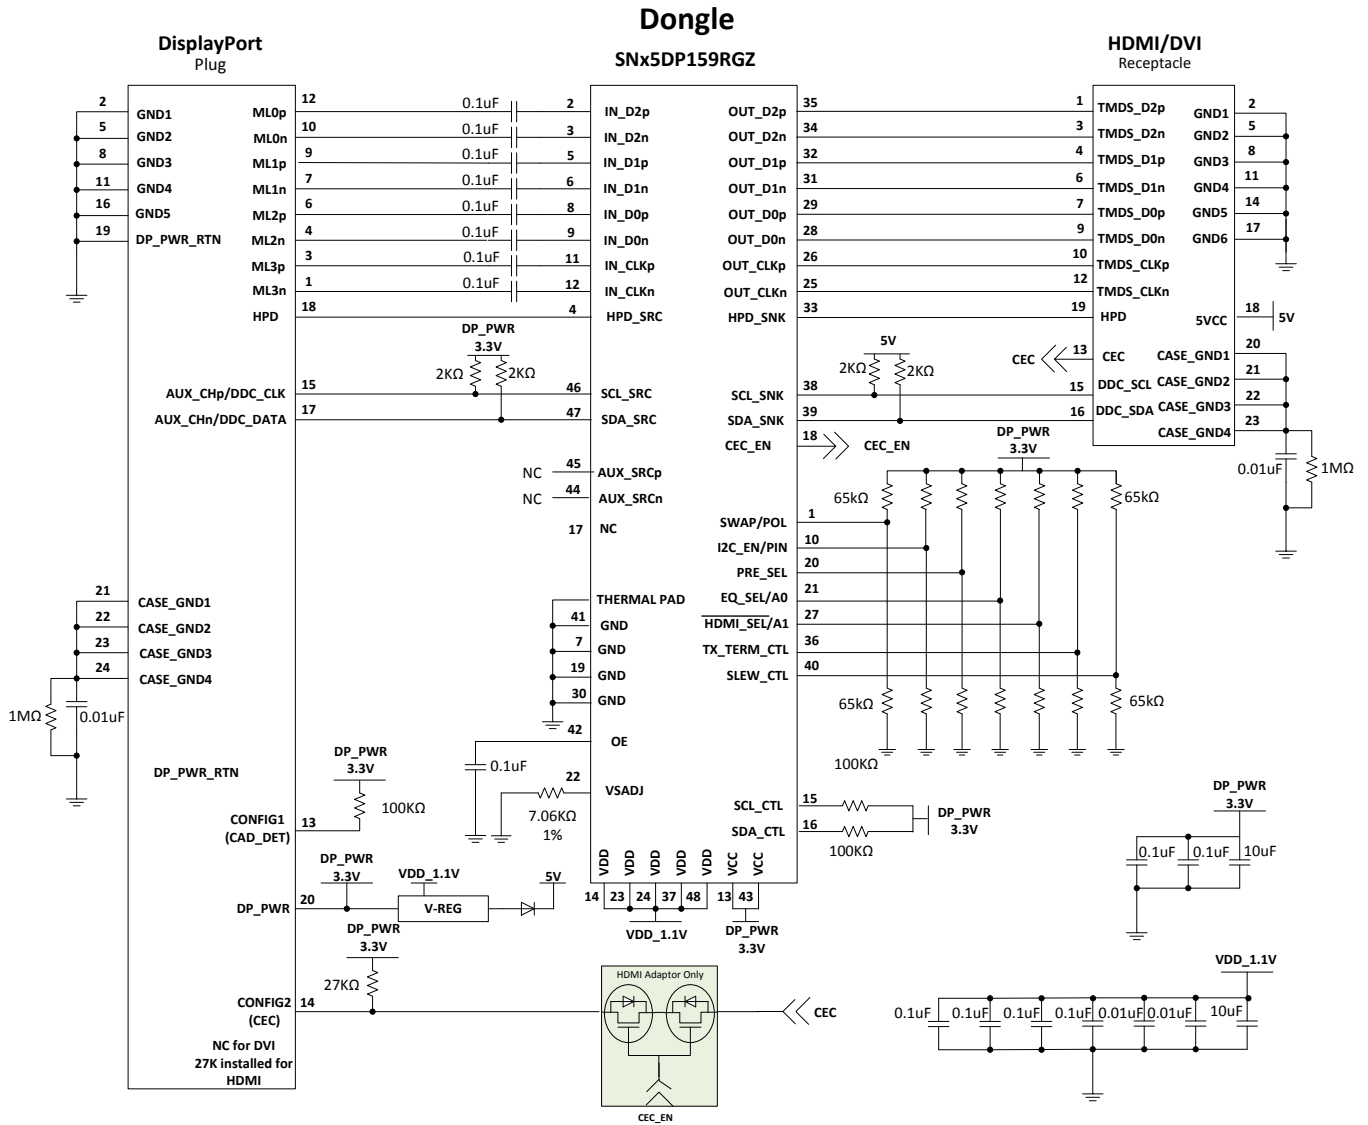

Copyright © 2016, Texas Instruments Incorporated

Note 1: For applications where the GPU or Sink does not support clock stretching the DDC lines from the GPU/DP TX should bypass the SCL_SRC and SDA_SRC but still connect to the SCL_SNK and SDA_SNK pins on the DP159. The SCL_SRC and SDA_SRC pins must be pulled to ground. Note that if the GPU/DP TX cannot support the 5V DDC lines from the connector, a level shifter is needed to step down the 5V signals to the voltage level the GPU/DP TX can support.

Figure 31. Implementation for Motherboard 2

Application Information (continued)

Figure 32 shows the SNx5DP159 in the dongle application. It uses the unified structure on DisplayPort connector. SNx5DP159 has to identify if the signal comes from DDC or from AUX in I²C-over-AUX format. Due to the AUX channel needed, use only the RGZ package for this application.

Figure 32. SNx5DP159 in Dongle Application

10.1.2 DDC Pullup Resistors

注

This section is for information only and subject to change depending upon system implementation.

Application Information (continued)

The pullup resistor value is determined by two requirements:

- A. The maximum sink current of the I²C buffer:

The maximum sink current is 3-mA or slightly higher for an I²C driver supporting standard-mode I²C[4] operation.

$$R_{up(min)} = \frac{V_{CC}}{I_{sink}} \quad (1)$$

- B. The maximum transition time on the bus:

The maximum transition time, T, of an I²C bus is set by an RC time constant, where R is the pullup resistor value, and C is the total load capacitance. The parameter, k, can be calculated from 式 3 by solving for t, the times at which certain voltage thresholds are reached. Different input threshold combinations introduce different values of t. 表 11 summarizes the possible values of k under different threshold combinations.

$$T = k \times RC \quad (2)$$

$$V(t) = V_{CC} \times \left(1 - e^{-\frac{t}{RC}} \right) \quad (3)$$

表 11. Value k Upon Different Input Threshold Voltages

V _{th} -V _{th+}	0.7 V _{CC}	0.65 V _{CC}	0.6 V _{CC}	0.55 V _{CC}	0.5 V _{CC}	0.45 V _{CC}	0.4 V _{CC}	0.35 V _{CC}	0.3 V _{CC}
0.1 V _{CC}	1.0986	0.9445	0.8109	0.6931	0.5878	0.4925	0.4055	0.3254	0.2513
0.15 V _{CC}	1.0415	0.8873	0.7538	0.6360	0.5306	0.4353	0.3483	0.2683	0.1942
0.2 V _{CC}	0.9808	0.8267	0.6931	0.5754	0.4700	0.3747	0.2877	0.2076	0.1335
0.25 V _{CC}	0.9163	0.7621	0.6286	0.5108	0.4055	0.3102	0.2231	0.1431	0.0690
0.3 V _{CC}	0.8473	0.6931	0.5596	0.4418	0.3365	0.2412	0.1542	0.0741	

From 式 1, $R_{up(min)} = 5.5\text{-V} / 3\text{-mA} = 1.83\text{-k}\Omega$ to operate the bus under a 5-V pullup voltage and provide less than 3-mA when the I²C device is driving the bus to a low state. If a higher sink current, for example 4 mA, is allowed, $R_{up(min)}$ can be as low as 1.375-k Ω .

If DDC is working at a standard mode of 100-Kbps, the maximum transition time, T, is fixed, 1 μ s, and using the k values from 表 11, the recommended maximum total resistance of the pullup resistors on an I²C bus can be calculated for different system setups. If DDC is working in a fast mode of 400-kbps, the transition time should be set at 300 ns, according to I²C[4] specification.

To support the maximum load capacitance specified in the HDMI specification, $C_{cable(max)} = 700\text{-pF}$, $C_{source} = 50\text{-pF}$, $C_i = 50\text{-pF}$, and $R_{(max)}$ can be calculated as shown in 表 12.

表 12. Pullup Resistor Upon Different Threshold Voltages and 800-pF Loads

V _{th} -V _{th+}	0.7 V _{CC}	0.65 V _{CC}	0.6 V _{CC}	0.55 V _{CC}	0.5 V _{CC}	0.45 V _{CC}	0.4 V _{CC}	0.35 V _{CC}	0.3 V _{CC}	UNIT
0.1 V _{CC}	1.14	1.32	1.54	1.8	2.13	2.54	3.08	3.84	4.97	k Ω
0.15 V _{CC}	1.2	1.41	1.66	1.97	2.36	2.87	3.59	4.66	6.44	k Ω
0.2 V _{CC}	1.27	1.51	1.8	2.17	2.66	3.34	4.35	6.02	9.36	k Ω
0.25 V _{CC}	1.36	1.64	1.99	2.45	3.08	4.03	5.6	8.74	18.12	k Ω
0.3 V _{CC}	1.48	1.8	2.23	2.83	3.72	5.18	8.11	16.87	—	k Ω

To accommodate the 3-mA drive current specification, a narrower threshold voltage range is required to support a maximum 800-pF load capacitance for a standard-mode I²C bus.

10.2 Typical Application

Copyright © 2016, Texas Instruments Incorporated

33. Implementation for Motherboard 1 Schematic

10.2.1 Design Requirements

The SNx5DP159 can be designed into many types of applications. All applications have certain requirements for the system to work properly. Two voltage rails are required to support the lowest possible power consumption. The OE pin must have a 0.1-µF capacitor to ground. This pin can be driven by a processor but the pin needs to change states after voltage rails have stabilized. Configure the device by using I²C. Pin strapping is provided as I²C is not available in all cases. Because sources may have different naming conventions, confirm the link between the source and the SNx5DP159 is correctly mapped. A swap function is provided for the input pins in case signaling is reversed between the source and the device. For the control pins the values provided below are when they are being controlled by a micro-controller. If this is not the case then using the 65-kΩ for a pull up for high, pulled down for low, and left floating for mid level.

表 13. Design Parameters

DESIGN PARAMETER	VALUE
V _{CC}	3.3 V
V _{DD}	1.1 V
Main link input voltage	V _{ID} = 75 mVpp to 1.2 Vpp
Control pin Low	65-kΩ pulled to GND
Control pin Mid	No Connect
Control pin High	65-kΩ pulled to 3.3-V
V _{sadj} resistor	7.06-kΩ
Main link AC decoupling capacitor	75 to 200 nF, recommend 100 nF

10.2.2 Detailed Design Procedure

The SNx5DP159 is a signal conditioner that provides AC coupling to DC coupling level shifting, to support Dual Mode DisplayPort-capable GPUs or GPUs with AC-coupled drive capability to support HDMI or DVI connectors and compliance. Signal conditioning is accomplished using receive equalization, retiming, and output driver configurability. The transmitter drives 2 to 3 inches of board trace and connector.

Designing in the SNx5DP159 requires the following:

- Determine the loss profile between the GPU and the HDMI/DVI connector.
- Based upon the loss profile and signal swing, determine the optimal location for the SNx5DP159, to pass electrical compliance.
- Use the typical application drawings in [Use Case of SNx5DP159](#) for information on using the AC coupling capacitors and control pin resistors.
- The DP159 has a receiver adaptive equalizer by default but can also be configured for fixed value equalization using the EQ_SEL control pin.
- Set the VOD, pre-emphasis, termination, and edge rate levels to support compliance by using the appropriate V_{sadj} resistor value and by setting the PRE_SEL, SLEW_CTL, and TX_TERM_CTL control pins.
- Adding pre-emphasis will improve performance on bandwidth limited channels and make steeper transitions. V_{OD} can be increased to compensate for DC losses and have a sheerer slope. SLEW_CTL handle transition inclination. Making the transition sharper will improve skew performance.
- The thermal pad must be connected to ground.
- See the schematics in [Application Information](#) on recommended decouple capacitors from VCC pins to ground.

10.2.3 Application Curve

图 34. 5.94 Gbps Compliance Eye Mask

10.3 System Example

10.3.1 Compliance Testing

Compliance testing is very system design specific. Properly designing the system and configuring the DP159 can help pass transmitter compliance for the system. The following information is the starting point to help prepare for compliance test. As each system is different there are many features in the DP159 to help tune the circuit. These include V_{OD} adjust by changing the V_{sadj} resistor value or using I²C. Other knobs to turn are pre/de-emphasis and slew rate control. Passing both HDMI2.0 and HDMI1.4b compliance is easier to accomplish when using I²C as this provides more fine tuning capability.

For the SNx5DP159RGZ:

Pin Strapping

HDMI2.0 & HDMI1.4b
 V_{sadj} Resistor = 7.06-k Ω
 PRE_SEL = NC for 0-dB
 TX_TERM_CTL = NC for Auto Select
 SLEW_CTL = NC

I²C Control

HDMI2.0 & HDMI1.4b
 V_{sadj} Resistor = 7.06 k Ω
 PRE_SEL = Reg0Ch[1:0] = 00 (labeled HDMI_TWPST)
 TX_TERM_CTL =

- Reg0Bh[4:3] = 00 → No term; HDMI1.4b < 2Gbps (This may be best value for all HDMI1.4b)
- Reg0Bh[4:3] = 01 → 150 to 300 Ω ; HDMI1.4b > 2Gbps
- Reg0Bh[4:3] = 11 → 75 to 150 Ω ; HDMI2.0

 SLEW_CTL = Reg0Bh[7:6] = 10

For the SNx5DP159RSB:

Pin Strapping

HDMI2.0 and HDMI1.4b
 V_{sadj} Resistor = 6.5 k Ω
 PRE_SEL = L for –2 dB
 TX_TERM_CTL = NC for Auto Select
 SLEW_CTL = NC

I²C

HDMI2.0
 V_{sadj} Resistor = 6.5 k Ω
 PRE_SEL = Reg0Ch[1:0] = 01 (labeled HDMI_TWPST)
 TX_TERM_CTL = Reg0Bh[4:3] = 11
 SLEW_CTL = Reg0Bh[7:6] = 10

HDMI1.4b

V_{sadj} Resistor = 6.5 k Ω
 VSWING_DATA & VSWING_CLK to -7% = Reg0Ch[7:2] = 111111
 PRE_SEL = Reg0Ch[1:0] = 00: (Labeled HDMI_TWPST)
 TX_TERM_CTL: Reg0Bh[4:3]

- <2 Gbps = 00 for no termination (This may be best value for all HDMI1.4b)
- >2 Gbps and < 3.4 Gbps = 01 for 150 to 300 Ω

 SLEW_CTL = Reg0Bh[7:6] = 10

11 Power Supply Recommendations

11.1 Power Management

To minimize the power consumption of customer application, SNx5DP159 uses dual power supply. V_{CC} is 3.3-V with 10% range to support the I/O voltage. The V_{DD} is 1.00-V to 1.27-V range to supply the internal digital control circuit. v operates in two different working states. See 表 14 for conditions for each mode. When OE is deasserted and then reasserted the device will rest to its default configurations. If different configurations were programmed using I²C then the device will have to be reprogrammed.

- Power-down mode:
 - OE = Low puts the device into its lowest power state by shutting down all function blocks
 - When OE is re-asserted the transitions from L → H will create a reset and if the device is programmed through I²C it will have to be reprogrammed.
 - OE = High, HPD_SNK = Low
 - Writing a 1 to register 09h[3]
- Normal operation: Working in redriver or retimer
- When HPD asserts, the device CDR and output will enable based on the signal detector circuit result
- HPD_SRC = HPD_SNK in all conditions. The HPD channel operational when V_{CC} over 3-V.

注

When the SNx5DP159 is put into a power down state using the OE pin the I²C registers are cleared. The TMDS_CLOCK_RATIO_STATUS bit will be cleared in all power down states. If cleared and HDMI2.0 resolutions are to be supported, the SNx5DP159 expects the source to write a 1 to this bit location. If this does not happen the PLL will not be set properly and no video may be evident.

表 14. Control Logic and Mode of Operation

INPUTS ⁽¹⁾		STATUS							MODE
HPD_SNK	OE	Mode of Operation	HPD_SRC	IN_Dx	SDA_CTL SCL_CTL	OUT_Dx OUT_CLK	DDC	AUX_SRC± (48 PIN ONLY)	
H	L	X	H	High-Z	Disabled	High-Z	Disabled	Disable	Power-down mode
L	H	X	L	High-Z	Active	High-Z	Disabled	Disable	Power-down mode

H	H	Retimer	H	RX active	Active	TX active	Active	Normal operation	

(1) L = LOW, H = HIGH

TMDS output termination control impacts the operating power.

12 Layout

12.1 Layout Guidelines

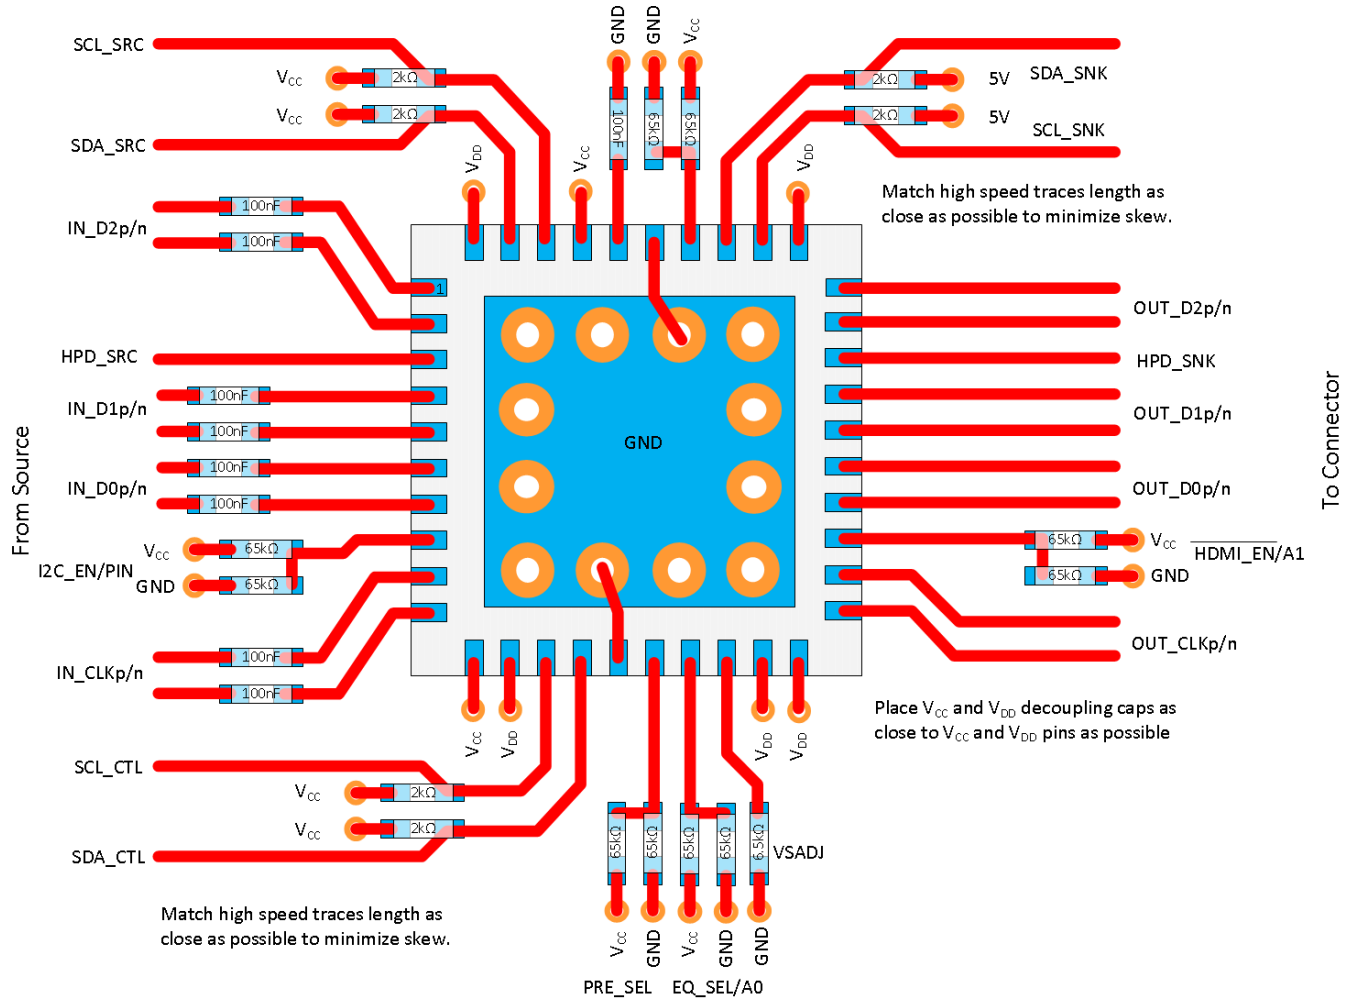

TI recommends to use at a minimum a four layer stack up to accomplish a low-EMI PCB design. TI recommends six layers because the SNx5DP159 is a two voltage rail device.

- Routing the high-speed input DisplayPort traces and TMDS output traces on the top layer avoids the use of vias (and their discontinuities) and allows for clean interconnects from the HDMI connectors to the repeater inputs and from the repeater output to the subsequent receiver circuit. It is important to match the electrical length of these high speed traces to minimize both inter-pair and intra-pair skew.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance.
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.
- If an additional supply voltage plane or signal layer is needed, add a second power / ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.
- The control pin pullup and pulldown resistors are shown in application section for reference. If a high is needed only use the pull up. If a low is needed only use the pull down. If mid level is to be selected do not use either resistors and leave the pin floating/No connect.

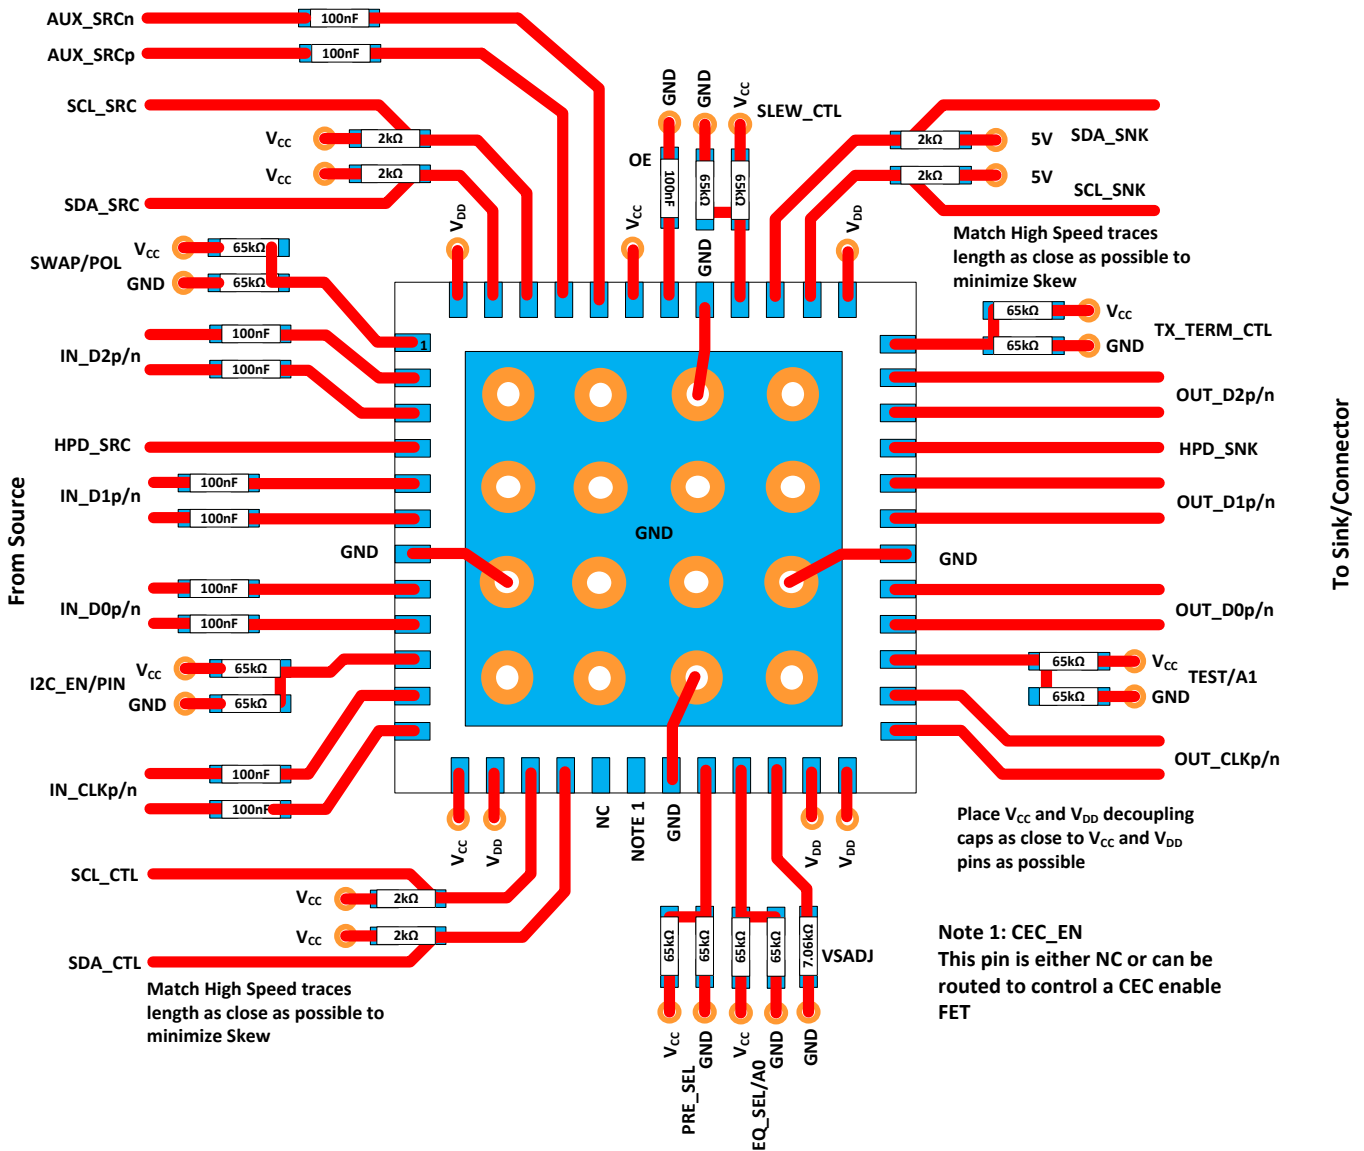

35. Recommended 4- or 6-Layer Stack for a Receiver PCB Design

12.2 Layout Examples

36. Layout Example for the DP159RSB

Layout Examples (continued)

37. Layout Example for the DP159RGZ

12.3 Thermal Considerations

On a high-K board: TI recommends to solder the PowerPAD™ onto the thermal land. A thermal land is the area of solder-tinned-copper underneath the PowerPAD package. On a high-K board, the SNx5DP159 device can operate over the full temperature range by soldering the PowerPAD onto the thermal land without vias.

On a low-K board: For the device to operate across the temperature range on a low-K board, a 1-oz Cu trace connecting the GND pins to the thermal land must be used. A simulation shows $R_{\theta JA} = 100.84^{\circ}\text{C}/\text{W}$ allowing 545-mW power dissipation at 70°C ambient temperature.

A general PCB design guide for PowerPAD packages is provided in *PowerPAD Thermally Enhanced Package*, [SLMA002](#).

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

GENERIC PACKAGE VIEW

RGZ 48

VQFN - 1 mm max height

7 x 7, 0.5 mm pitch

PLASTIC QUADFLAT PACK- NO LEAD

Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4224671/A

RGZ0048B

PACKAGE OUTLINE

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

4218795/B 02/2017

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

EXAMPLE BOARD LAYOUT

RGZ0048B

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:12X

SOLDER MASK DETAILS

4218795/B 02/2017

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sluea271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

RGZ0048B

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

SOLDER PASTE EXAMPLE
 BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD 49
 73% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE
 SCALE:12X

4218795/B 02/2017

NOTES: (continued)

- 6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

GENERIC PACKAGE VIEW

RSB 40

WQFN - 0.8 mm max height

5 x 5 mm, 0.4 mm pitch

PLASTIC QUAD FLATPACK - NO LEAD

Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4207182/D

RSB0040E

PACKAGE OUTLINE

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

4219096/A 11/2017

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.
