Bit	Field	Type	Reset	Description
31-16	PPSE16_QUAD1_MSTID	R/W	0h	There are 16 bits for each quadrant in PPSE frame. These bits set the permission for maximum of 16 masters to address the peripheral mapped in each of the quadrant. The scheme is similar to the one described for PS MSTID in section 1.7.30. Readable in both user and privileged modes. 1 = The peripheral mapped in the quadrant can be addressed by master with matching Master-ID. 0 = The peripheral is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.
15-0	PPSE16_QUAD0_MSTID	R/W	0h	There are 16 bits for each quadrant in PPSE frame. These bits set the permission for maximum of 16 masters to address the peripheral mapped in each of the quadrant. The scheme is similar to the one described for PS MSTID in section 1.7.30. Readable in both user and privileged modes. 1 = The peripheral mapped in the quadrant can be addressed by master with matching Master-ID. 0 = The peripheral is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.

Table 3-597. PPSE24MSTID_H Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PPSE24_QUAD3_MSTID	R/W	0h	There are 16 bits for each quadrant in PPSE frame. These bits set the permission for maximum of 16 masters to address the peripheral mapped in each of the quadrant. The scheme is similar to the one described for PS MSTID in section 1.7.30. Readable in both user and privileged modes. 1 = The peripheral mapped in the quadrant can be addressed by master with matching Master-ID. 0 = The peripheral is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.
15-0	PPSE24_QUAD2_MSTID	R/W	0h	There are 16 bits for each quadrant in PPSE frame. These bits set the permission for maximum of 16 masters to address the peripheral mapped in each of the quadrant. The scheme is similar to the one described for PS MSTID in section 1.7.30. Readable in both user and privileged modes. 1 = The peripheral mapped in the quadrant can be addressed by master with matching Master-ID. 0 = The peripheral is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.

3.4.3.160 PPSE25MSTID_L Register (Offset = 508h) [Reset = 0000000h]

PPSE25MSTID_L is shown in [Table 3-598](#).

Return to the [Summary Table](#).

Privileged Peripheral Extended Frame Master-ID Protection Register25_L

Table 3-598. PPSE25MSTID_L Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PPSE25_QUAD1_MSTID	R/W	0h	There are 16 bits for each quadrant in PPSE frame. These bits set the permission for maximum of 16 masters to address the peripheral mapped in each of the quadrant. The scheme is similar to the one described for PS MSTID in section 1.7.30. Readable in both user and privileged modes. 1 = The peripheral mapped in the quadrant can be addressed by master with matching Master-ID. 0 = The peripheral is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.
15-0	PPSE25_QUAD0_MSTID	R/W	0h	There are 16 bits for each quadrant in PPSE frame. These bits set the permission for maximum of 16 masters to address the peripheral mapped in each of the quadrant. The scheme is similar to the one described for PS MSTID in section 1.7.30. Readable in both user and privileged modes. 1 = The peripheral mapped in the quadrant can be addressed by master with matching Master-ID. 0 = The peripheral is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.

3.4.3.161 PPSE25MSTID_H Register (Offset = 50Ch) [Reset = 0000000h]

Bit	Field	Type	Reset	Description
31-0	PCREXT_MSTID	R/W	0h	These bits sets the permission for maximum of 16 masters to address the external PCR frame. The scheme is similar to the one described for PCSm MSTID in section 1.7.33. Readable in both user and privileged modes. 1 = The memory mapped in respective frames can be addressed by master with matching Master-ID. 0 = The memory is locked for master with matching Master-ID. PCR responds with AERROR. Writable only in privileged mode 1 = Sets the corresponding bit. 0 = Clears the corresponding bit. Writes to unimplemented bits have no effect and reads yield 0.

4.1 Initialization Overview

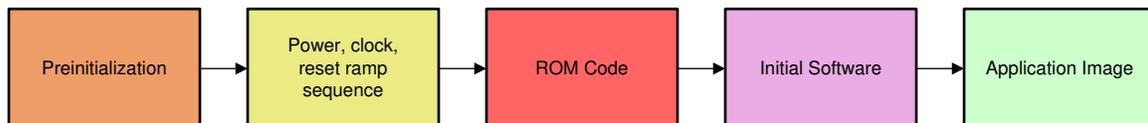

Figure 4-1. Device Initialization

Below is an overview of the initialization process and its steps:

- **Preinitialization:** Power, clock, and control connections (UART/CAN/Ethernet etc.) must be present, and the boot configuration pins must be held at the desired logical levels.
- **Power, clock, reset ramp sequence:** Specific sequence that is applied by the power-management chip
- **ROM code:** Responsible for finding, downloading, and executing the initial software (SBL) from sFlash.
- **Initial software:** Software that loads, prepares, and passes control to application software.
- **Application Image:** The application that runs on the main core/processor.

The first two steps in the initialization process are hardware-oriented; however, they require an understanding of the process of configuring these system interface pins (balls on the device), which have software-configurable functionality. This configuration is an essential part of the chip configuration and is application-dependent. This chapter discusses these system-interface pins, the associated configuration registers, and memory structures that are vital to the correct initialization of the device.

4.2 Boot Process

4.2.1 ROM Code Overview

ROM bootloader (or ROM Code) is a software that resides in a on-chip read-only memory (ROM) to assist the customer in transferring and executing their application code. The device has two ROM codes that work together – the MCU ROM (R5F ROM) code and the HSM ROM code.

To accommodate various system scenarios, the ROM code supports several boot modes. These boot modes can be broadly classified as:

- Host boot modes
- Memory boot modes.

During a host boot, the device is configured to receive code from a host through the selected interface (such as UART). Either the host writes the application code directly into internal memory over UART, or the ROM code receives the application code on the selected interface and stores it in internal memory.

During a memory boot, the device transfers code from non-volatile memory to internal memory for execution.

In all boot modes, the entire boot operation can be partitioned into two sections:

- Hardware initialization phase
- Boot process

During initialization, the ROM code configures the device resources (PLLs, peripherals, pins) as needed to support the boot process. The resources used depend on the boot mode requirements. During the boot process,

the boot image can be loaded into device memory and executed, depending on the boot peripheral. HSM ROM code performs code verification and allows or forbids the image execution.

The main configuration source for boot after power-up are the SOP mode pins sampled automatically after reset release and stored in device status registers. At ROM code startup, these pin values are read from the registers to create the boot peripheral list, and the boot configuration tables used later to initialize and startup the PLLs and boot peripherals.

4.2.2 Boot Modes

MCU ROM supports the functionality of loading the secondary boot loader (SBL). The SBL can be loaded through QSPI (primary/secondary SBL) and UART mode. The primary use case of QSPI programming through UART interface is to support the uniFlash utility. This mode programming may be applicable for certain use cases, such as initial FLASH programming in volume mass production, that can also be achieved with special in-circuit gang programming tools.

Primary functional boot mode is through QSPI FLASH. MCU ROM supports managing multiple (primary and backup) QSPI SBL images. It can identify the primary image, and switch to secondary image load if primary image load fails.

Table 4-1. Boot Modes and Boot Media

Boot Mode/Peripheral	Boot Media/Host	Notes
QSPI	QSPI flash	Download and boot SBL from QSPI flash. Attempt Primary SBL, followed by Secondary SBL if primary loading fails: If above is not successful
UART	External host	Download and boot SBL from UART. Device is expected to get SBL from UART. We will support the XMODEM protocol for download over UART.

For more information about various bootmode and flash device support please refer to [application note](#).

4.2.3 SOP Mode Pins

[Table 4-2](#) lists the functional mode pin settings to be done for the SOP lines of the device to boot using different peripheral. New SOP modes will be added later.

Table 4-2. Functional Mode Pin Settings

Functional Mode	SOP Mode	PMIC_OUT	SYNC_OUT	TDO
Func Mode –QSPI	SOP_MODE4	0	0	1
Func Mode –UART	SOP_MODE5	1	0	1

4.2.4 BOOT-ROM Architecture (RBL)

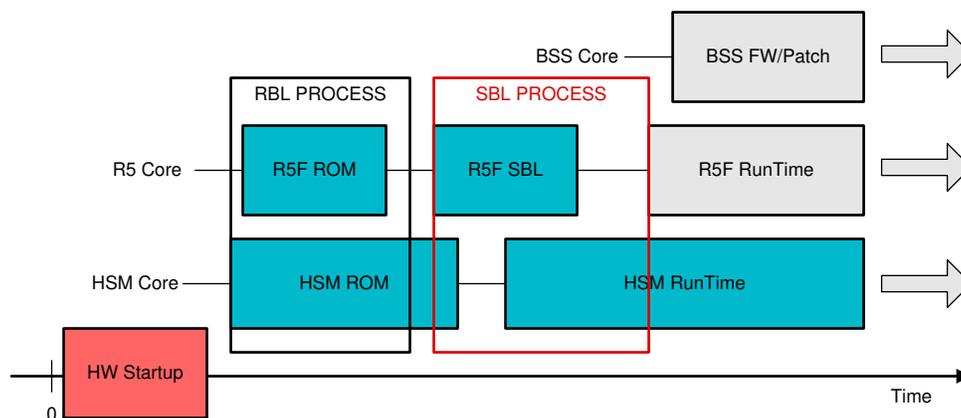

Figure 4-2. Boot Flow and Boot ROM Architecture

The RBL process goal is to load, verify, optionally decrypt, and launch an authentic R5F software image that accomplishes general-purpose/secure boot goals. The RBL process is implemented jointly by the R5F and HSM ROM as illustrated in [Figure 4-2](#).

HSM ROM

This HSM ROM contains the first set of software instructions that is executed by any processor core on all AWR2544 devices. All state changes in the device after the external reset is released but prior to the beginning of the HSM ROM code execution are purely a function of hardware logic. This hardware logic must perform sufficient ramp up and initialization to allow the Cortex M4 core of the HSM to leave reset and begin execution from its reset vector. The HSM ROM code is “time zero” software. The HSM ROM code is only intended to be used during the initial load of the secondary boot loader (SBL) and HSM RunTime image. HSM ROM is also responsible for providing Test/Debug capabilities when functional boot is interrupted.

R5F ROM

The R5F ROM code is only intended to be used during the initial load of the secondary boot loader (SBL). RBL can load the SBL content only to MSS_L2 area and at the end copies SBL's IVT (interrupt vector table) of 640B size to TCMA_RAM_CR5A before switching to SBL. This ROM-to-RAM (RBL to SBL) switching causes TCMA_ROM_CR5A eclipse to TCMA_RAM_CR5A i.e. 0x0000_0000 now maps to TCMA_RAM_CR5A memory area. Use of RBL at any other time in the lifecycle of a system is not supported. R5F ROM executes set of self-tests: PBIST (DATA SRAM, PROGRAM SRAM, and ROM Code Integrity) using a hardware-defined interface. If unsuccessful, the error condition is indicated, external ESM signal asserted, and boot does not proceed.

R5F SBL

This SBL can perform complete boot sequence on general purpose devices. Customers are expected to develop their own SBLs, supporting a wider range of requirements (such as different interfaces, additional protocols, different image formats, future update flow and so forth).

HSM RunTime/R5F Runtime

HSM RunTime is only applicable in case of Secured (HS) variant and out of scope of this document. R5F user developed applications and loaded/executed by SBL.

4.2.5 R5F SBL Loading

The SBL process starts with R5F executing loaded and verified R5F SBL code.

The only service exposed to R5F SBL by HSM ROM is the API to load the HSM RunTime. All other HSM services are outside of the HSM ROM. The R5 Boot ROM and HSM Boot ROM work together to load the R5F SBL. When the R5F SBL has been successfully validated and loaded, the R5F Boot-ROM is eclipsed and the R5F SBL executes.

[Figure 4-3](#) is the simplified sequence of the boot process. It is provided for illustration purposes only. An illustration of the SBL and HSM RunTime is similar to what is shown in [Figure 4-3](#).

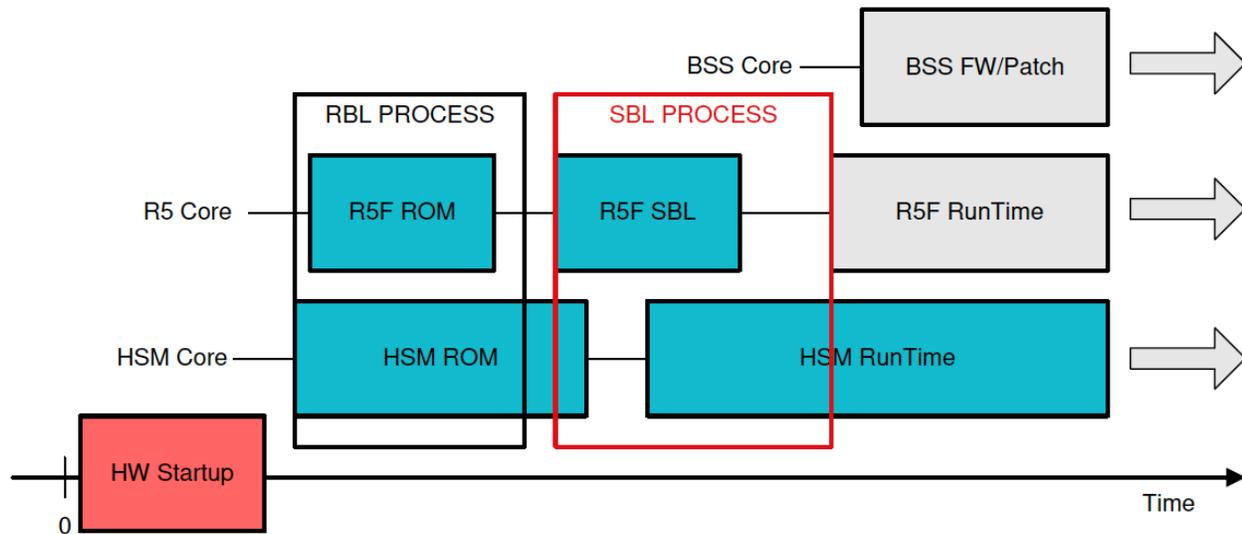

Figure 4-3. R5F SBL

Figure 4-3. R5F SBL

HSM ROM configures the IPC interface, unhalts the R5F core, and then waits for a confirmation message from the R5F Core (over IPC). The R5F core sends a confirmation to the HSM ROM. The R5F ROM then configures the QSPI interface and reads the R5F SBL image from FLASH. The SBL image might or might not have integrity check enabled (based on the certificate). HSM ROM switches the memory map for R5F from ROM to RAM and resets the R5F to execute the SBL image. The HSM-ROM for GP devices is now locked (black-boxed). SBL can now load the multicore image (containing MSS & DSS application and RSS firmware/patch images) to the corresponding RAMs and core soft-reset to jump to R5F RunTime. SBL or R5F RunTime can release out-of-reset & unhalt RadarSS and C66x subsystems.

For more information about SBL and bootloading please refer to the [application note](#)

5.1 Overview

PRCM manages clocks, resets, and power domain control of subsystems and modules inside the device. Additionally, configuration of certain device-level features is also performed through this module. PRCM has control and status registers to achieve this functionality. The Clock and Reset Management in AWR2544 is distributed. The Main subsystem TOPRCM module controls all the Subsystem Resets and Clocks. The SubSystem RCM modules control their respective subsystem IPs

The available address space of PRCM is divided as in [Figure 5-1](#).

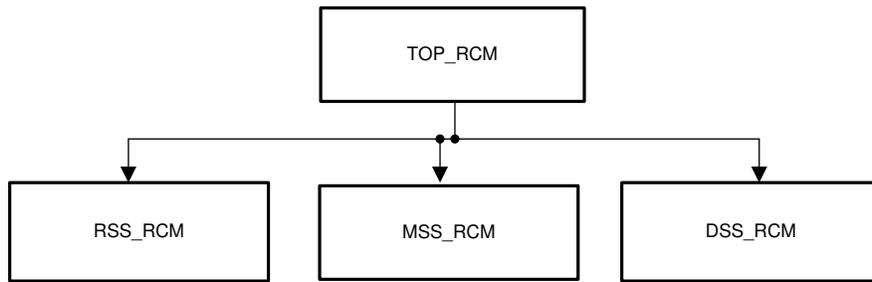

Figure 5-1. Device Configuration

Table 5-1. PRCM Space

PRCM Space	Description
MSS_TOPRCM/TOP_RCM	Top-level reset, clock management registers
MSS_RCM	Main subsystem reset, clock management registers
RSS_RCM	Radar subsystem reset, clock management registers
DSS_RCM	DSP reset, clock management registers

Note

TOP_RCM and MSS_TOPRCM names are used interchangeably across this document and are pointed to same RCM space.

5.2 Control Registers

5.2.1 MSS_TOPRCM Registers

Table 5-2 lists the memory-mapped registers for the MSS_TOPRCM registers. All register offset addresses not listed in Table 5-2 should be considered as reserved locations and the register contents should not be modified.

Table 5-2. MSS_TOPRCM Registers

Complex bit access types are encoded to fit into small table cells. [Table 5-3](#) shows the codes that are used for access types in this section.

Table 5-3. MSS_TOPRCM Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read

**Table 5-3. MSS_TOPRCM Access Type Codes
(continued)**

Access Type	Code	Description
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

5.2.1.1 PID Register (Offset = 0h) [Reset = 61800214h]

PID is shown in [Table 5-4](#).

Return to the [Summary Table](#).

PID register

Table 5-4. PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PID_msb16	R	6180h	
15-11	PID_misc	R	0h	
10-8	PID_major	R	2h	
7-6	PID_custom	R	0h	
5-0	PID_minor	R	14h	

5.2.1.2 HW_REG0 Register (Offset = 4h) [Reset = 00000000h]

HW_REG0 is shown in [Table 5-5](#).

Return to the [Summary Table](#).

Table 5-5. HW_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved register. Reserved for HW RnD

5.2.1.3 HW_REG1 Register (Offset = 8h) [Reset = 0000000h]

HW_REG1 is shown in [Table 5-6](#).

Return to the [Summary Table](#).

Table 5-6. HW_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser. Reserved for HW RnD

5.2.1.4 PREVIOUS_NAME Register (Offset = Ch) [Reset = 00000000h]

PREVIOUS_NAME is shown in [Table 5-7](#).

Return to the [Summary Table](#).

Table 5-7. PREVIOUS_NAME Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser. Reserved for HW RnD

5.2.1.5 HW_REG3 Register (Offset = 10h) [Reset = 0000000h]

HW_REG3 is shown in [Table 5-8](#).

Return to the [Summary Table](#).

Table 5-8. HW_REG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved register. Reserved for HW RnD

5.2.1.6 HSI_CLK_SRC_SEL Register (Offset = 14h) [Reset = 0000000h]

HSI_CLK_SRC_SEL is shown in [Table 5-9](#).

Return to the [Summary Table](#).

Table 5-9. HSI_CLK_SRC_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	clksrcsel	R/W	0h	Select line for selecting source clock for HSI. Data should be loaded as multibit. For example: if Clock source 0x5 should be selected then 0x555 should be configured to the register. Refer to TPR12 clock spec for source clock reference

5.2.1.7 CSIRX_CLK_SRC_SEL Register (Offset = 18h) [Reset = 0000000h]

CSIRX_CLK_SRC_SEL is shown in [Table 5-10](#).

Return to the [Summary Table](#).

Table 5-10. CSIRX_CLK_SRC_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	clksrcsel	R/W	0h	Select line for selecting source clock for CSI Rx Data should be loaded as multibit. For example: if Clock source 0x5 should be selected then 0x555 should be configured to the register. Refer to TPR12 clock spec for source clock reference

5.2.1.8 MCUCLKOUT_CLK_SRC_SEL Register (Offset = 1Ch) [Reset = 0000000h]

MCUCLKOUT_CLK_SRC_SEL is shown in [Table 5-11](#).

Return to the [Summary Table](#).

Table 5-11. MCUCLKOUT_CLK_SRC_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	clksrcsel	R/W	0h	Select line for selecting source clock for MCU Clkout Data should be loaded as multibit. For example: if Clock source 0x5 should be selected then 0x555 should be configured to the register. Refer to TPR12 clock spec for source clock reference

5.2.1.9 PMICCLKOUT_CLK_SRC_SEL Register (Offset = 20h) [Reset = 0000000h]

PMICCLKOUT_CLK_SRC_SEL is shown in [Table 5-12](#).

Return to the [Summary Table](#).

Table 5-12. PMICCLKOUT_CLK_SRC_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	clksrcsel	R/W	0h	Select line for selecting source clock for PMIC Clkout Data should be loaded as multibit. For example: if Clock source 0x5 should be selected then 0x555 should be configured to the register. Refer to TPR12 clock spec for source clock reference

5.2.1.10 OBSCLKOUT_CLK_SRC_SEL Register (Offset = 24h) [Reset = 0000000h]

OBSCLKOUT_CLK_SRC_SEL is shown in [Table 5-13](#).

Return to the [Summary Table](#).

Table 5-13. OBSCLKOUT_CLK_SRC_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	clksrcsel	R/W	0h	Select line for selecting source clock for OBS Clkout Data should be loaded as multibit. For example: if Clock source 0x5 should be selected then 0x555 should be configured to the register. Refer to TPR12 clock spec for source clock reference

5.2.1.11 TRCCLKOUT_CLK_SRC_SEL Register (Offset = 28h) [Reset = 0000000h]

TRCCLKOUT_CLK_SRC_SEL is shown in [Table 5-14](#).

Return to the [Summary Table](#).

Table 5-14. TRCCLKOUT_CLK_SRC_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	clksrcsel	R/W	0h	Select line for selecting source clock for TRC Clkout Data should be loaded as multibit. For example: if Clock source 0x5 should be selected then 0x555 should be configured to the register. Refer to TPR12 clock spec for source clock reference

5.2.1.12 CSIRX_DIV_VAL Register (Offset = 44h) [Reset = 0000000h]

CSIRX_DIV_VAL is shown in [Table 5-15](#).

Return to the [Summary Table](#).

Table 5-15. CSIRX_DIV_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	clkdiv	R/W	0h	Divider value for CSI Rx selected clock. Data should be loaded as multibit. For example: if divider value of 0x5 should be selected then 0x555 should be configured to the register.

5.2.1.13 MCUCLKOUT_DIV_VAL Register (Offset = 48h) [Reset = 0000000h]

MCUCLKOUT_DIV_VAL is shown in [Table 5-16](#).

Return to the [Summary Table](#).

Table 5-16. MCUCLKOUT_DIV_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	clkdiv	R/W	0h	Divider value for MCU Clkout selected clock. Data should be loaded as multibit. For example: if divider value of 0x5 should be selected then 0x555 should be configured to the register.

5.2.1.14 PMICCLKOUT_DIV_VAL Register (Offset = 4Ch) [Reset = 0000000h]

PMICCLKOUT_DIV_VAL is shown in [Table 5-17](#).

Return to the [Summary Table](#).

Table 5-17. PMICCLKOUT_DIV_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	clkdiv	R/W	0h	Divider value for PMIC Clkout selected clock. Data should be loaded as multibit. For example: if divider value of 0x5 should be selected then 0x555 should be configured to the register.

5.2.1.15 OBSCLKOUT_DIV_VAL Register (Offset = 50h) [Reset = 0000000h]

OBSCLKOUT_DIV_VAL is shown in [Table 5-18](#).

Return to the [Summary Table](#).

Table 5-18. OBSCLKOUT_DIV_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	clkdiv	R/W	0h	Divider value for OBS Clkout selected clock. Data should be loaded as multibit. For example: if divider value of 0x5 should be selected then 0x555 should be configured to the register.

5.2.1.16 TRCCLKOUT_DIV_VAL Register (Offset = 54h) [Reset = 0000000h]

TRCCLKOUT_DIV_VAL is shown in [Table 5-19](#).

Return to the [Summary Table](#).

Table 5-19. TRCCLKOUT_DIV_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	clkdiv	R/W	0h	Divider value for TRC Clkout selected clock. Data should be loaded as multibit. For example: if divider value of 0x5 should be selected then 0x555 should be configured to the register.

5.2.1.17 CSIRX_CLK_GATE Register (Offset = 84h) [Reset = 00000000h]

CSIRX_CLK_GATE is shown in [Table 5-20](#).

Return to the [Summary Table](#).

Table 5-20. CSIRX_CLK_GATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	gated	R/W	0h	Clock gating config for CSI Rx. Data should be loaded as multibit. Write 3'b000 : Clock is ungated (multibit 000) Write 3'b111 : Clock is gated (multibit 111)

5.2.1.18 MCUCLKOUT_CLK_GATE Register (Offset = 88h) [Reset = 0000007h]

MCUCLKOUT_CLK_GATE is shown in [Table 5-21](#).

Return to the [Summary Table](#).

Table 5-21. MCUCLKOUT_CLK_GATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	gated	R/W	7h	Clock gating config for MCU Clkout. Data should be loaded as multibit. Write 3'b000 : Clock is ungated (multibit 000) Write 3'b111 : Clock is gated (multibit 111)

5.2.1.19 PMICCLKOUT_CLK_GATE Register (Offset = 8Ch) [Reset = 0000007h]

PMICCLKOUT_CLK_GATE is shown in [Table 5-22](#).

Return to the [Summary Table](#).

Table 5-22. PMICCLKOUT_CLK_GATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	gated	R/W	7h	Clock gating config for PMIC Clkout Data should be loaded as multibit. Write 3'b000 : Clock is ungated (multibit 000) Write 3'b111 : Clock is gated (multibit 111)

5.2.1.20 OBSCLKOUT_CLK_GATE Register (Offset = 90h) [Reset = 00000000h]

OBSCLKOUT_CLK_GATE is shown in [Table 5-23](#).

Return to the [Summary Table](#).

Table 5-23. OBSCLKOUT_CLK_GATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	gated	R/W	0h	Clock gating config for OBS Clkout Data should be loaded as multibit. Write 3'b000 : Clock is ungated (multibit 000) Write 3'b111 : Clock is gated (multibit 111)

5.2.1.21 TRCCLKOUT_CLK_GATE Register (Offset = 94h) [Reset = 0000000h]

TRCCLKOUT_CLK_GATE is shown in [Table 5-24](#).

Return to the [Summary Table](#).

Table 5-24. TRCCLKOUT_CLK_GATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	gated	R/W	0h	Clock gating config for TRC Clkout Data should be loaded as multibit. Write 3'b000 : Clock is ungated (multibit 000) Write 3'b111 : Clock is gated (multibit 111)

5.2.1.22 DSS_CLK_GATE Register (Offset = 98h) [Reset = 0000000h]

DSS_CLK_GATE is shown in [Table 5-25](#).

Return to the [Summary Table](#).

Table 5-25. DSS_CLK_GATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	gated	R/W	0h	Clock gating config for DSP Subsystem System Clock Data should be loaded as multibit. Write 3'b000 : Clock is ungated (multibit 000) Write 3'b111 : Clock is gated (multibit 111)

5.2.1.23 HSI_CLK_STATUS Register (Offset = C0h) [Reset = 0000002h]

HSI_CLK_STATUS is shown in [Table 5-26](#).

Return to the [Summary Table](#).

Table 5-26. HSI_CLK_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7-0	clkinuse	R	2h	Status shows the source clock selected for CortexR5 Clock

5.2.1.24 MCUCLKOUT_CLK_STATUS Register (Offset = C8h) [Reset = 00000100h]

MCUCLKOUT_CLK_STATUS is shown in [Table 5-27](#).

Return to the [Summary Table](#).

Table 5-27. MCUCLKOUT_CLK_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-8	currdivider	R	1h	Status shows the current divider value chosen for CSI Rx Clock
7-0	clkinuse	R	0h	Status shows the source clock selected for CSI Rx Clock

5.2.1.25 PMICCLKOUT_CLK_STATUS Register (Offset = CCh) [Reset = 0000100h]

PMICCLKOUT_CLK_STATUS is shown in [Table 5-28](#).

Return to the [Summary Table](#).

Table 5-28. PMICCLKOUT_CLK_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-8	currdivider	R	1h	Status shows the current divider value chosen for MCU Clkout Clock
7-0	clkinuse	R	0h	Status shows the source clock slected for MCU Clkout Clock

5.2.1.26 OBSCLKOUT_CLK_STATUS Register (Offset = D0h) [Reset = 0000001h]

OBSCLKOUT_CLK_STATUS is shown in [Table 5-29](#).

Return to the [Summary Table](#).

Table 5-29. OBSCLKOUT_CLK_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-8	currdivider	R	0h	Status shows the current divider value chosen for PMIC Clkout Clock
7-0	clkinuse	R	1h	Status shows the source clock slected for PMIC Clkout Clock

5.2.1.27 TRCCLKOUT_CLK_STATUS Register (Offset = D4h) [Reset = 0000001h]

TRCCLKOUT_CLK_STATUS is shown in [Table 5-30](#).

Return to the [Summary Table](#).

Table 5-30. TRCCLKOUT_CLK_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-8	currdivider	R	0h	Status shows the current divider value chosen for PMIC Clkout Clock
7-0	clkinuse	R	1h	Status shows the source clock slected for PMIC Clkout Clock

5.2.1.28 WARM_RESET_CONFIG Register (Offset = 100h) [Reset = 0007XXXXh]

WARM_RESET_CONFIG is shown in [Table 5-31](#).

Return to the [Summary Table](#).

Table 5-31. WARM_RESET_CONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RESERVED	R/W	0h	
18-16	wdog_rst_en	R/W	7h	Data should be loaded as multibit. Write 3'b000 to disable MSS Watchdog control on Warm reset Write 3'b111 enable MSS Watchdog to control Warm reset
15-11	RESERVED	R/W	0h	
10-8	sw_rst	R/W	7h	Data should be loaded as multibit. Write 3'b000 to assert warm reset from SW Write 3'b111 to deassert warm reset from SW if this is the only source of warm reset
7-3	RESERVED	R/W	0h	
2-0	pad_bypass	R/W	7h	Bypass the Warm reset from Pad Input Data should be loaded as multibit. Write 3'b000 : Reset is not asserted by SW (multibit 000) Write 3'b111 : Reset is asserted by SW (multibit 111)

5.2.1.29 SYS_RST_CAUSE Register (Offset = 104h) [Reset = 0000009h]

SYS_RST_CAUSE is shown in [Table 5-32](#).

Return to the [Summary Table](#).

Table 5-32. SYS_RST_CAUSE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R	0h	
4-0	cause	R	9h	System Reset Cause register 5'b01001 - POR reset 5'b01010 - Warm reset due to MSS_WDT 5'b01100 - Warm reset due to TOP_RMC:WARM_RESET_CONFIG 5'b01000 - External Pad reset 5'b11000 - Warm reset due to HSM_WDT

5.2.1.30 SYS_RST_CAUSE_CLR Register (Offset = 108h) [Reset = 00000000h]

SYS_RST_CAUSE_CLR is shown in [Table 5-33](#).

Return to the [Summary Table](#).

Table 5-33. SYS_RST_CAUSE_CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	0h	
0	clear	R/W	0h	Write pulse bit field: System Reset Cause register Clear

5.2.1.31 DSS_RST_CTRL Register (Offset = 10Ch) [Reset = 0000000h]

DSS_RST_CTRL is shown in [Table 5-34](#).

Return to the [Summary Table](#).

Table 5-34. DSS_RST_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	assert	R/W	0h	Reset control for DSP Subsystem Data should be loaded as multibit. Write 3'b000: Reset is not asserted by SW (multibit 000) Write 3'b111 : Reset is asserted by SW (multibit 111)

5.2.1.32 RS232_BITINTERVAL Register (Offset = 204h) [Reset = 51615D5Bh]

RS232_BITINTERVAL is shown in [Table 5-35](#).

Return to the [Summary Table](#).

Table 5-35. RS232_BITINTERVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	bitinterval	R/W	51615D5Bh	RS232 Bit Interval. 10 bit clock interval is selected based on the value of MSS_CR5_CLK_SRC_SEL [9:0] used as RS232 Bit interval when MSS_CR5_CLK_SRC_SEL = 0x0 [19:10] used as RS232 Bit interval when MSS_CR5_CLK_SRC_SEL = 0x1 [29:20] used as RS232 Bit interval when MSS_CR5_CLK_SRC_SEL = 0x2

5.2.1.33 LVDS_PAD_CTRL0 Register (Offset = 208h) [Reset = 01010101h]

LVDS_PAD_CTRL0 is shown in [Table 5-36](#).

Return to the [Summary Table](#).

Table 5-36. LVDS_PAD_CTRL0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ctrl	R/W	01010101h	LVDS Pad Control 0 Register. Below is the mapping for each bit. Refer the LVDS IO Spec for more details Bit 0 : Power Down Control for LVDS CLK Lane Bit 1: LOPWRA Control for i LVDS CLK Lane Bit 2: LOPWRB Control for LVDS CLK Lane Bit 3 : LPSEL Control for LVDS CLK Lane Bit 4 : SUB_LVDS_EN Control for LVDS CLK Lane Bit 5 : HIZ_DISABLE Control for LVDS CLK Lane Bit 6 : EXT_RES_EN Control for LVDS CLK Lane Bit 7 : Reserved Bit 8 : Power Down Control for LVDS DATA Lane 0 Bit 9: LOPWRA Control for i LVDS DATA Lane 0 Bit 10: LOPWRB Control for LVDS DATA Lane 0 Bit 11: LPSEL Control for LVDS DATA Lane 0 Bit 12: SUB_LVDS_EN Control for LVDS DATA Lane 0 Bit 13: HIZ_DISABLE Control for LVDS DATA Lane 0 Bit 14: EXT_RES_EN Control for LVDS DATA Lane 0 Bit 15: Reserved Bit 16 : Power Down Control for LVDS DATA Lane 1 Bit 17: LOPWRA Control for i LVDS DATA Lane 1 Bit 18: LOPWRB Control for LVDS DATA Lane 1 Bit 18: LPSEL Control for LVDS DATA Lane 1 Bit 20: SUB_LVDS_EN Control for LVDS DATA Lane 1 Bit 21: HIZ_DISABLE Control for LVDS DATA Lane 1 Bit 22: EXT_RES_EN Control for LVDS DATA Lane 1 Bit 23: Reserved Bit 24 : Power Down Control for LVDS DATA Lane 2 Bit 25: LOPWRA Control for i LVDS DATA Lane 2 Bit 26: LOPWRB Control for LVDS DATA Lane 2 Bit 27: LPSEL Control for LVDS DATA Lane 2 Bit 28: SUB_LVDS_EN Control for LVDS DATA Lane 2 Bit 29: HIZ_DISABLE Control for LVDS DATA Lane 2 Bit 30: EXT_RES_EN Control for LVDS DATA Lane 2 Bit 31: Reserved

5.2.1.34 LVDS_PAD_CTRL1 Register (Offset = 20Ch) [Reset = 0000101h]

LVDS_PAD_CTRL1 is shown in [Table 5-37](#).

Return to the [Summary Table](#).

Table 5-37. LVDS_PAD_CTRL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ctrl	R/W	101h	LVDS Pad Control 1 Register. Below is the mapping for each bit. Refer the LVDS IO Spec for more details Bit 0 : Power Down Control for LVDS DATA Lane 0 Bit 1: LOPWRA Control for i LVDS DATA Lane 0 Bit 2: LOPWRB Control for LVDS DATA Lane 0 Bit 3: LPSEL Control for LVDS DATA Lane 0 Bit 4: SUB_LVDS_EN Control for LVDS DATA Lane 0 Bit 5: HIZ_DISABLE Control for LVDS DATA Lane 0 Bit 6: EXT_RES_EN Control for LVDS DATA Lane 0 Bit 7: Reserved Bit 8 : Power Down Control for LVDS FRME CLK Lane Bit 9 : LOPWRA Control for i LVDS FRAME CLK Lane Bit 10: LOPWRB Control for LVDS FRAME CLK Lane Bit 11 : LPSEL Control for LVDS FRAME CLK Lane Bit 12 : SUB_LVDS_EN Control for LVDS FRAME CLK Lane Bit 13 : HIZ_DISABLE Control for LVDS FRAME CLK Lane Bit 14 : EXT_RES_EN Control for LVDS FRAME CLK Lane Bit 15 -23: Reserved Bit 24 : Power Down Control for LVDS Bias cell Bit 25 : eFuse Set Control for LVDS Bias cell

5.2.1.35 DFT_DMLED_EXEC Register (Offset = 210h) [Reset = 0000000h]

DFT_DMLED_EXEC is shown in [Table 5-38](#).

Return to the [Summary Table](#).

Table 5-38. DFT_DMLED_EXEC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	val	R/W	0h	SW mapping for DMLED Execution Bit 0 : HSM CM4 Execution Bit 1 : RESERVED Bit 2 : MSS CR5 Execution

5.2.1.36 DFT_DMLED_STATUS Register (Offset = 214h) [Reset = 0000000h]

DFT_DMLED_STATUS is shown in [Table 5-39](#).

Return to the [Summary Table](#).

Table 5-39. DFT_DMLED_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description

5.2.1.37 LIMP_MODE_EN Register (Offset = 218h) [Reset = 00000XXh]

LIMP_MODE_EN is shown in [Table 5-40](#).

Return to the [Summary Table](#).

Table 5-40. LIMP_MODE_EN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R/W	0h	
10-8	force_rcclk_en	R/W	0h	Force the RCCLK on when limp mode is detected 3'b000: The RCCLK will not be forced on when limp mode is detected (multibit 000) 3'b111 : The RCCLK will be forced on when limp mode is detected (multibit 111)
7	RESERVED	R/W	0h	
6-4	ccca_en	R/W	0h	Enable MSS_CCCA Error to generate Limp mode 3'b000: MSS_CCCA Error will not generate Limp mode (multibit 000) 3'b111 : MSS_CCCA Error will generate Limp mode (multibit 111)
3	RESERVED	R/W	0h	
2-0	dcca_en	R/W	0h	Enable MSS_DCCA Error to generate Limp mode 3'b000: MSS_DCCA Error will not generate Limp mode (multibit 000) 3'b111 : MSS_DCCA Error will generate Limp mode (multibit 111)

5.2.1.38 PMICCLKOUT_DCDC_CTRL Register (Offset = 21Ch) [Reset = 00000XXh]

PMICCLKOUT_DCDC_CTRL is shown in [Table 5-41](#).

Return to the [Summary Table](#).

Table 5-41. PMICCLKOUT_DCDC_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R/W	0h	
23-16	max_freq_thr	R/W	0h	PMIC Clockout DCDC Maximum Frequency Threshold
15-8	min_freq_thr	R/W	0h	PMIC Clockout DCDC Minimum Frequency Threshold
7	RESERVED	R/W	0h	
6-4	reset_assert	R/W	0h	Reset control for PMIC DCDC Data should be loaded as multibit. Write 3'b000: Reset is not asserted by SW (multibit 000) Write 3'b111 : Reset is asserted by SW (multibit 111)
3	RESERVED	R/W	0h	
2	freq_acc_mode	R/W	0h	PMIC Clockout DCDC Freq Acc Enable
1	dither_en	R/W	0h	PMIC Clockout DCDC Clock Dither Enable
0	dcdc_clk_en	R/W	0h	PMIC Clockout DCDC Clock Enable

5.2.1.39 PMICCLKOUT_DCDC_SLOPE Register (Offset = 220h) [Reset = 0000000h]

PMICCLKOUT_DCDC_SLOPE is shown in [Table 5-42](#).

Return to the [Summary Table](#).

Table 5-42. PMICCLKOUT_DCDC_SLOPE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R/W	0h	
26-0	slope_val	R/W	0h	PMIC Clockout DCDC Slope Config Value

5.2.1.40 RCOSC32K_CTRL Register (Offset = 224h) [Reset = 0000000h]

RCOSC32K_CTRL is shown in [Table 5-43](#).

Return to the [Summary Table](#).

Table 5-43. RCOSC32K_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	stoposc	R/W	0h	Stop 32KHz RCOSC. Write 3'b111 to stop clock

5.2.1.41 ANA_HSI2DIGCLK_GATE Register (Offset = 228h) [Reset = 00000007h]

ANA_HSI2DIGCLK_GATE is shown in [Table 5-44](#).

Return to the [Summary Table](#).

Table 5-44. ANA_HSI2DIGCLK_GATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	gated	R/W	7h	Clock gating config for Analog HSI Clkout to Core GCms Data should be loaded as multibit. Write 3'b000 : Clock is ungated (multibit 000) Write 3'b111 : Clock is gated (multibit 111)

5.2.1.42 DSI_PHY_PWRCTRL Register (Offset = 22Ch) [Reset = 0000033h]

DSI_PHY_PWRCTRL is shown in [Table 5-45](#).

Return to the [Summary Table](#).

Table 5-45. DSI_PHY_PWRCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RESERVED	R/W	0h	
5	PGOODOUT	R	1h	TI Reserved Dont touch.
4	PONOUT	R	1h	TI Reserved Dont touch.
3	ISOSCAN	R/W	0h	Save/Restore control for Isolation of the Scanout pins. For functional mode it should be 0
2	ISO	R/W	0h	Save/Restore control for Isolation of output pins For functional mode it should be 0
1	PGOODIN	R/W	1h	ON/OFF control of the strong power switch digital. For functional mode it should be 1
0	PONIN	R/W	1h	ON/OFF control of the weak power switch digital. For functional mode it should be 1

5.2.1.43 RS232_SOP11_BITINTERVAL Register (Offset = 230h) [Reset = 00001B2h]

RS232_SOP11_BITINTERVAL is shown in [Table 5-46](#).

Return to the [Summary Table](#).

Table 5-46. RS232_SOP11_BITINTERVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	val	R/W	1B2h	RS232 Bit Interval when SOP11 (ANA_WU_MODE_REG_LOWV[6:5]) is selected. XTAL is 50M and this field can be used to modify the baud rate.

5.2.1.44 PLL_CORE_PWRCTRL Register (Offset = 400h) [Reset = 0000030h]

PLL_CORE_PWRCTRL is shown in [Table 5-47](#).

Return to the [Summary Table](#).

Table 5-47. PLL_CORE_PWRCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RESERVED	R/W	0h	
5	PONIN	R/W	1h	ON/OFF control of the weak power switch digital. For functional mode it should be 1
4	PGOODIN	R/W	1h	ON/OFF control of the strong power switch digital. For functional mode it should be 1
3	RET	R/W	0h	Save/Restore control for Retention mode. For functional mode it should be 0
2	ISORET	R/W	0h	Save/Restore control for Isolation of output pins For functional mode it should be 0
1	ISOSCAN	R/W	0h	Save/Restore control for Isolation of the Scanout pins. For functional mode it should be 0
0	OFFMODE	R/W	0h	Used to switch OFF the logic on VDDA. For functional mode it should be 0

5.2.1.45 PLL_CORE_CLKCTRL Register (Offset = 404h) [Reset = 0991XXXXh]

PLL_CORE_CLKCTRL is shown in [Table 5-48](#).

Return to the [Summary Table](#).

Table 5-48. PLL_CORE_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CYCLESCLIPEN	R/W	0h	FailSafe enable to trigger re-calibration in case CycleSlip occurs between REFCLK and FBCLK.
30	ENSSC	R/W	0h	Controls Clock Spreading. SSC is not supported. Should be set to 0x0 to disable clock spreading.
29	CLKDCOLDOEN	R/W	0h	Synchronously enables/disables CLKDCOLDO 0x0 : synchronously disables CLKDCOLDO 0x1 : synchronously enables CLKDCOLDO
28-24	NWELLTRIM	R/W	9h	Trim value for the PLL
23	IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 1 IDLE = 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 IDLE = 1 PLL will go to Idle Bypass low power
22	BYPASSACKZ	R/W	0h	BYPASSACKZ is a special purpose input to the module. In general this input is expected to be tied to static low. For the output clocks of the module that do not have an internal bypass mux viz. CLKDCOLDO and CLKOUTLDO, a bypass mux could be implemented external to the module.
21	STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	CLKOUTEN	R/W	1h	CLKOUT enable or disable 0x0 : synchronously disables CLKOUT 0x1 : synchronously enables CLKOUT
19	CLKOUTLDOEN	R	0h	Synchronously enables/disables CLKOUTLDO 0x0 : synchronously disables CLKOUTLDO 0x1 : synchronously enables CLKOUTLDO
18	ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0: When ADPLLLJ in bypass mode, CLKOUT = CLKINP/(N2+1) 0x1: When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.
17	CLKDCOLDOPWDNZ	R/W	0h	0 Asynchronous power down for CLKDCOLDO o/p.
16	M2PWDNZ	R/W	1h	M2 divider power down mode 0x0: Asynchronous power down for M2 divider 0x1 : M2 divider is functional
15	RESERVED	R/W	0h	
14	STOPMODE	R/W	1h	When in Lossclk/Stbyret 0x0 : Limp mode 0x1 : Stopmode
13	RESERVED	R/W	0h	
12-10	SELFREQDCO	R/W	2h	DCO Clock (DCOCLK = CLKINP * [M/(N+1)]) frequency range selector. 0x0: Reserved 0x2: HS2 : DCOCLK range is from 500 MHz to 1000 MHz 0x3: Reserved 0x4: HS1: DCOCLK range is from 1000 MHz to 2000 MHz 0x5: Reserved
9	RESERVED	R/W	0h	
8	RELAXED_LOCK	R/W	0h	Decides when FREQLOCK asserted 0x0: FREQLOCK asserted when DC frequency error less than 1% 0x1: FREQLOCK asserted when DC frequency error less than 2%
7-2	RESERVED	R/W	0h	
1	SSCTYPE	R/W	0h	SSC Type
0	TINTZ	R/W	0h	PLL core soft reset

5.2.1.46 PLL_CORE_TENABLE Register (Offset = 408h) [Reset = 00000000h]

PLL_CORE_TENABLE is shown in [Table 5-49](#).

Return to the [Summary Table](#).

Table 5-49. PLL_CORE_TENABLE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	0h	
0	TENABLE	R/W	0h	M, N. SD and SELFREQDCO latch (active rise edge)

5.2.1.47 PLL_CORE_TENABLEDIV Register (Offset = 40Ch) [Reset = 0000000h]

PLL_CORE_TENABLEDIV is shown in [Table 5-50](#).

Return to the [Summary Table](#).

Table 5-50. PLL_CORE_TENABLEDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	0h	
0	TENABLEDIV	R/W	0h	M2 and N2 latch (active rise edge)

5.2.1.48 PLL_CORE_M2NDIV Register (Offset = 410h) [Reset = 0000XX00h]

PLL_CORE_M2NDIV is shown in [Table 5-51](#).

Return to the [Summary Table](#).

Table 5-51. PLL_CORE_M2NDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-23	RESERVED	R/W	0h	
22-16	M2	R/W	0h	Post-divider is REGM2
15-8	RESERVED	R/W	0h	
7-0	N	R/W	0h	Pre-divider is REGN+1

5.2.1.49 PLL_CORE_MN2DIV Register (Offset = 414h) [Reset = 0000X174h]

PLL_CORE_MN2DIV is shown in [Table 5-52](#).

Return to the [Summary Table](#).

Table 5-52. PLL_CORE_MN2DIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	RESERVED	R/W	0h	
19-16	N2	R/W	0h	Bypass divider is REGN2+1
15-12	RESERVED	R/W	0h	
11-0	M	R/W	174h	Feedback Multiplier is REGM

5.2.1.50 PLL_CORE_FRACDIV Register (Offset = 418h) [Reset = 08XX0000h]

PLL_CORE_FRACDIV is shown in [Table 5-53](#).

Return to the [Summary Table](#).

Table 5-53. PLL_CORE_FRACDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	REGSD	R/W	8h	Sigma-Delta Divider Should be set by s/w to provide optimum jitter performance. $DPLL_SD_DIV = \text{CEILING} \left(\frac{DPLL_MULT}{(DPLL_DIV+1)} * \frac{CLKINP}{250} \right)$, where CLKINP is the input clock of the DPLL in MHz
23-18	RESERVED	R/W	0h	
17-0	FRACTIONALM	R/W	0h	Fractional part of the M divider.

5.2.1.51 PLL_CORE_BWCTRL Register (Offset = 41Ch) [Reset = 0000000h]

PLL_CORE_BWCTRL is shown in [Table 5-54](#).

Return to the [Summary Table](#).

Table 5-54. PLL_CORE_BWCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-1	BWCONTROL	R/W	0h	Change Loop Bandwidth
0	BW_INCR_DECRZ	R/W	0h	Direction of Loop Bandwidth 0x0 : decrease BW 0x1 : increase BW

5.2.1.52 PLL_CORE_FRACCTRL Register (Offset = 420h) [Reset = 0000000h]

PLL_CORE_FRACCTRL is shown in [Table 5-55](#).

Return to the [Summary Table](#).

Table 5-55. PLL_CORE_FRACCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DOWNSPREAD	R/W	0h	Controls frequency spread 0x0 : enables both side frequency spread about the programmed frequency. 0x1 : enables low frequency spread only
30-28	ModFreqDividerExponent	R/W	0h	Exponent of the REFCLK divider to define the modulation frequency.
27-21	ModFreqDividerMantissa	R/W	0h	Mantissa of the REFCLK divider to define the modulation frequency
20-18	DeltaMStepInteger	R/W	0h	Integer part of Frequency Spread control
17-0	DeltaMStepFraction	R/W	0h	The fraction part of Frequency Spread control

5.2.1.53 PLL_CORE_STATUS Register (Offset = 424h) [Reset = EXXXX161h]

PLL_CORE_STATUS is shown in [Table 5-56](#).

Return to the [Summary Table](#).

Table 5-56. PLL_CORE_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	R	1h	Status of the weak power-switch 0x0 : indicates the/OFF status of the weak power-switch in digital to SOC. 0x1 : ndicates the ON status of the weak power-switch in digital to SOC.
30	PGOODOUT	R	1h	Status of the strong power-switch 0x0 : indicates the/OFF status of the strong power-switch in digital to SOC. 0x1 : ndicates the ON status of the strong power-switch in digital to SOC.
29	LDOPWDN	R	1h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration
26-12	RESERVED	R	0h	
11	CLKDCOLDOACK	R	0h	Status on PHASELOCK output pin
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	1h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0: indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the relock process. 0x1: indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	1h	Reference input loss
5	CLKOUTENACK	R	1h	Indicates the enable/disable condition of CLKOUTEN 0x0 = CLKOUT gating completed 0x1 = CLKOUT enabling completed
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	Acknowledge for change to M2 divider. Toggles from 1-0 or 0-1 (depending on current value) once CLKOUT frequency change has completed.
2	SSACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

5.2.1.54 PLL_CORE_HSDIVIDER Register (Offset = 428h) [Reset = 0000XXXXh]

PLL_CORE_HSDIVIDER is shown in [Table 5-57](#).

Return to the [Summary Table](#).

Table 5-57. PLL_CORE_HSDIVIDER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	RESERVED	R/W	0h	
17	LDOPWDNACK	R	0h	LDO Power Down Ack
16	BYPASSACKZ	R	0h	HSDIVIDER Bypass Ack
15-3	RESERVED	R/W	0h	
2	TENABLEDIV	R/W	0h	Tenable Div
1	LDOPWDN	R/W	0h	LDO Power Down
0	BYPASS	R/W	0h	HSDIVIDER Bypass

5.2.1.55 PLL_CORE_HSDIVIDER_CLKOUT0 Register (Offset = 42Ch) [Reset = 0000XX4h]

PLL_CORE_HSDIVIDER_CLKOUT0 is shown in [Table 5-58](#).

Return to the [Summary Table](#).

Table 5-58. PLL_CORE_HSDIVIDER_CLKOUT0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-13	RESERVED	R/W	0h	
12	PWDN	R/W	0h	Power down for HSDIVIDER M4 divider and hence CLKOUT0 output 0h (R/W) = CLKOUT0 divider active 1h (R/W) = CLKOUT0 divider is powered down
11-10	RESERVED	R/W	0h	
9	STATUS	R	0h	HSDIVIDER CLKOUT0 status 0h (R) = The clock output is gated 1h (R) = The clock output is enabled
8	GATE_CTRL	R/W	0h	Control gating of HSDIVIDER CLKOUT0 0h (R/W) = Automatically gate this clock when there is no dependency for it 1h (R/W) = Force this clock to stay enabled even if there is no request
7-6	RESERVED	R/W	0h	
5	DIVCHACK	R	0h	Toggle on this status bit after changing HSDIVIDER_CLKOUT0_DIV indicates that the change in divider value has taken effect
4-0	DIV	R/W	4h	DPLL post-divider factor, M4, for internal clock generation. Divide values from 1 to 31. 0h (R/W) = Reserved

5.2.1.56 PLL_CORE_HSDIVIDER_CLKOUT1 Register (Offset = 430h) [Reset = 0000XX4h]

PLL_CORE_HSDIVIDER_CLKOUT1 is shown in [Table 5-59](#).

Return to the [Summary Table](#).

Table 5-59. PLL_CORE_HSDIVIDER_CLKOUT1 Register Field Descriptions

Bit	Field	Type	Reset	Description

SYS_CLK_STATUS is shown in [Table 5-67](#).

Return to the [Summary Table](#).

Table 5-67. SYS_CLK_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-8	currdivider	R	0h	Status shows the current divider value chosen for Sys Clock
7-0	RESERVED	R	0h	

5.2.1.65 MSS_CR5_CLK_STATUS Register (Offset = 454h) [Reset = 0000001h]

MSS_CR5_CLK_STATUS is shown in [Table 5-68](#).

Return to the [Summary Table](#).

Table 5-68. MSS_CR5_CLK_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-8	currdivider	R	0h	Status shows the current divider value chosen for CortexR5 Clock
7-0	clkinuse	R	1h	Status shows the source clock selected for CortexR5 Clock

5.2.1.66 PLL_CORE_RSTCTRL Register (Offset = 458h) [Reset = 00000000h]

PLL_CORE_RSTCTRL is shown in [Table 5-69](#).

Return to the [Summary Table](#).

Table 5-69. PLL_CORE_RSTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	assert	R/W	0h	SW Reset override for the PLL Write 3'b111 : Override is enabled and Reset is asserted

5.2.1.67 PLL_CORE_HSDIVIDER_RSTCTRL Register (Offset = 45Ch) [Reset = 0000000h]

PLL_CORE_HSDIVIDER_RSTCTRL is shown in [Table 5-70](#).

Return to the [Summary Table](#).

Table 5-70. PLL_CORE_HSDIVIDER_RSTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	assert	R/W	0h	SW Reset override for the HSDIVIDER Write 3'b111 : Override is enabled and Reset is asserted

5.2.1.68 RSS_CLK_SRC_SEL Register (Offset = 460h) [Reset = 0000000h]

RSS_CLK_SRC_SEL is shown in [Table 5-71](#).

Return to the [Summary Table](#).

Table 5-71. RSS_CLK_SRC_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	clksrcsel	R/W	0h	Select line for selecting source clock for RSS Data should be loaded as multibit. For example: if Clock source 0x5 should be selected then 0x555 should be configured to the register. Refer to TPR12 clock spec for source clock reference

5.2.1.69 PLLC_CLK2_SRC_SEL Register (Offset = 464h) [Reset = 0000000h]

PLLC_CLK2_SRC_SEL is shown in [Table 5-72](#).

Return to the [Summary Table](#).

Table 5-72. PLLC_CLK2_SRC_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	clksrcsel	R/W	0h	Select line for selecting source clock for for PLLCORE_HSDIV_CLKOUT2_MUXED Data should be loaded as multibit. For example: if Clock source 0x5 should be selected then 0x555 should be configured to the register. Refer to TPR12 clock spec for source clock reference

5.2.1.70 PLLD_CLK1_SRC_SEL Register (Offset = 468h) [Reset = 0000000h]

PLLD_CLK1_SRC_SEL is shown in [Table 5-73](#).

Return to the [Summary Table](#).

Table 5-73. PLLD_CLK1_SRC_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	clksrcsel	R/W	0h	Select line for selecting source clock for PLLCORE_HSDIV_CLKOUT2_MUXED Data should be loaded as multibit. For example: if Clock source 0x5 should be selected then 0x555 should be configured to the register. Refer to TPR12 clock spec for source clock reference

5.2.1.71 PLLD_CLK2_SRC_SEL Register (Offset = 46Ch) [Reset = 0000000h]

PLLD_CLK2_SRC_SEL is shown in [Table 5-74](#).

Return to the [Summary Table](#).

Table 5-74. PLLD_CLK2_SRC_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	clksrcsel	R/W	0h	Select line for selecting source clock for PLLDSP_HSDIV_CLKOUT2_MUXED. Data should be loaded as multibit. For example: if Clock source 0x5 should be selected then 0x555 should be configured to the register. Refer to TPR12 clock spec for source clock reference

5.2.1.72 PLLP_CLK1_SRC_SEL Register (Offset = 470h) [Reset = 0000000h]

PLLP_CLK1_SRC_SEL is shown in [Table 5-75](#).

Return to the [Summary Table](#).

Table 5-75. PLLP_CLK1_SRC_SEL Register Field Descriptions

5	PONIN	R/W	1h	ON/OFF control of the weak power switch digital. For functional mode it should be 1
4	PGOODIN	R/W	1h	ON/OFF control of the strong power switch digital. For functional mode it should be 1
3	RET	R/W	0h	Save/Restore control for Retention mode. For functional mode it should be 0
2	ISORET	R/W	0h	Save/Restore control for Isolation of output pins For functional mode it should be 0
1	ISOSCAN	R/W	0h	Save/Restore control for Isolation of the Scanout pins. For functional mode it should be 0
0	OFFMODE	R/W	0h	Used to switch OFF the logic on VDDA. For functional mode it should be 0

5.2.1.110 PLL_PER_CLKCTRL Register (Offset = 840h) [Reset = 0991XXXXh]

PLL_PER_CLKCTRL is shown in [Table 5-113](#).

Return to the [Summary Table](#).

Table 5-113. PLL_PER_CLKCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CYCLESLLIPEN	R/W	0h	FailSafe enable to trigger re-calibration in case CycleSlip occurs between REFCLK and FBCLK.
30	ENSSC	R/W	0h	Controls Clock Spreading. SSC is not supported. Should be set to 0x0 to disable clock spreading.
29	CLKDCOLDOEN	R/W	0h	Synchronously enables/disables CLKDCOLDO 0x0 : synchronously disables CLKDCOLDO 0x1 : synchronously enables CLKDCOLDO
28-24	NWELLTRIM	R/W	9h	Trim value for the PLL
23	IDLE	R/W	1h	Sets PLL to Idle mode 0x0 : When SYSRESET = 0 and TINITZ = 1 IDLE = 0 PLL will go to Active and Locked 0x1 : When SYSRESET = 0 and TINITZ = 1 IDLE = 1 PLL will go to Idle Bypass low power
22	BYPASSACKZ	R/W	0h	BYPASSACKZ is a special purpose input to the module. In general this input is expected to be tied to static low. For the output clocks of the module that do not have an internal bypass mux viz. CLKDCOLDO and CLKOUTLDO, a bypass mux could be implemented external to the module.
21	STBYRET	R/W	0h	Standby retention control 0x0 : prepares ADPLLLJ for relock when out of retention by removing the gating on all internal clocks. 0x1 : prepares ADPLLLJ for retention by gating all the internal clocks.
20	CLKOUTEN	R/W	1h	CLKOUT enable or disable 0x0 : synchronously disables CLKOUT 0x1 : synchronously enables CLKOUT
19	CLKOUTLDOEN	R	0h	Synchronously enables/disables CLKOUTLDO 0x0 : synchronously disables CLKOUTLDO 0x1 : synchronously enables CLKOUTLDO
18	ULOWCLKEN	R/W	0h	Select CLKOUT source in bypass 0x0: When ADPLLLJ in bypass mode, CLKOUT = CLKINP/(N2+1) 0x1: When ADPLLLJ in bypass mode, CLKOUT = CLKINPULOW.
17	CLKDCOLDOPWDNZ	R/W	0h	0 Asynchronous power down for CLKDCOLDO o/p.
16	M2PWDNZ	R/W	1h	M2 divider power down mode 0x0: Asynchronous power down for M2 divider 0x1 : M2 divider is functional
15	RESERVED	R/W	0h	
14	STOPMODE	R/W	1h	When in Lossclk/Stbyret 0x0 : Limp mode 0x1 : Stopmode
13	RESERVED	R/W	0h	
12-10	SELFREQDCO	R/W	2h	DCO Clock (DCOCLK = CLKINP * [M/(N+1)]) frequency range selector. 0x0: Reserved 0x2: HS2 : DCOCLK range is from 500 MHz to 1000 MHz 0x3: Reserved 0x4: HS1: DCOCLK range is from 1000 MHz to 2000 MHz 0x5: Reserved
9	RESERVED	R/W	0h	
8	RELAXED_LOCK	R/W	0h	Decides when FREQLOCK asserted 0x0: FREQLOCK asserted when DC frequency error less than 1% 0x1: FREQLOCK asserted when DC frequency error less than 2%
7-2	RESERVED	R/W	0h	
1	SSCTYPE	R/W	0h	SSC Type
0	TINTZ	R/W	0h	PLL core soft reset

5.2.1.111 PLL_PER_TENABLE Register (Offset = 844h) [Reset = 0000000h]

PLL_PER_TENABLE is shown in [Table 5-114](#).

Return to the [Summary Table](#).

15-12	RESERVED	R/W	0h	
11-0	M	R/W	174h	Feedback Multiplier is REGM

5.2.1.115 PLL_PER_FRACDIV Register (Offset = 854h) [Reset = 08XX0000h]

PLL_PER_FRACDIV is shown in [Table 5-118](#).

Return to the [Summary Table](#).

Table 5-118. PLL_PER_FRACDIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	REGSD	R/W	8h	Sigma-Delta Divider Should be set by s/w to provide optimum jitter performance. $DPLL_SD_DIV = \text{CEILING} \left(\frac{DPLL_MULT}{(DPLL_DIV+1)} * \frac{CLKINP}{250} \right)$, where CLKINP is the input clock of the DPLL in MHz
23-18	RESERVED	R/W	0h	
17-0	FRACTIONALM	R/W	0h	Fractional part of the M divider.

5.2.1.116 PLL_PER_BWCTRL Register (Offset = 858h) [Reset = 0000000h]

PLL_PER_BWCTRL is shown in [Table 5-119](#).

Return to the [Summary Table](#).

Table 5-119. PLL_PER_BWCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-1	BWCONTROL	R/W	0h	Change Loop Bandwidth
0	BW_INCR_DECRZ	R/W	0h	Direction of Loop Bandwidth 0x0 : decrease BW 0x1 : increase BW

5.2.1.117 PLL_PER_FRACCTRL Register (Offset = 85Ch) [Reset = 0000000h]

PLL_PER_FRACCTRL is shown in [Table 5-120](#).

Return to the [Summary Table](#).

Table 5-120. PLL_PER_FRACCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DOWNSPREAD	R/W	0h	Controls frequency spread 0x0 : enables both side frequency spread about the programmed frequency. 0x1 : enables low frequency spread only
30-28	ModFreqDividerExponent	R/W	0h	Exponent of the REFCLK divider to define the modulation frequency.
27-21	ModFreqDividerMantissa	R/W	0h	Mantissa of the REFCLK divider to define the modulation frequency
20-18	DeltaMStepInteger	R/W	0h	Integer part of Frequency Spread control
17-0	DeltaMStepFraction	R/W	0h	The fraction part of Frequency Spread control

5.2.1.118 PLL_PER_STATUS Register (Offset = 860h) [Reset = EXXX161h]

PLL_PER_STATUS is shown in [Table 5-121](#).

Return to the [Summary Table](#).

Table 5-121. PLL_PER_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PONOUT	R	1h	Status of the weak power-switch 0x0 : indicates the/OFF status of the weak power-switch in digital to SOC. 0x1 : ndicates the ON status of the weak power-switch in digital to SOC.
30	PGOODOUT	R	1h	Status of the strong power-switch 0x0 : indicates the/OFF status of the strong power-switch in digital to SOC. 0x1 : ndicates the ON status of the strong power-switch in digital to SOC.
29	LDOPWDN	R	1h	1 indicates ADPLLLJ internal LDO is power down. VDDLDOOUT will be un-defined in this condition
28	RECAL_BSTATUS3	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration
27	RECAL_OPPIN	R	0h	Recalibration status flag. 1 ADPLLLJ requires recalibration
26-12	RESERVED	R	0h	
11	CLKDCOLDOACK	R	0h	Status on PHASELOCK output pin
10	PHASELOCK	R	0h	Status on PHASELOCK output pin
9	FREQLOCK	R	0h	Status on FREQLOCK output pin
8	BYPASSACK	R	1h	Status of BYPASSACK output pin
7	STBYRETACK	R	0h	Standby and retention status 0x0: indicates to SOC that all internal clocks in ADPLLLJ are active and it is starting the relock process. 0x1: indicates to SOC that all internal clocks in ADPLLLJ are gated and it is ready for retention.
6	LOSSREF	R	1h	Reference input loss
5	CLKOUTENACK	R	1h	Indicates the enable/disable condition of CLKOUTEN 0x0 = CLKOUT gating completed 0x1 = CLKOUT enabling completed
4	LOCK2	R	0h	ADPLL internal loop lock status
3	M2CHANGEACK	R	0h	Acknowledge for change to M2 divider. Toggles from 1-0 or 0-1 (depending on current value) once CLKOUT frequency change has completed.
2	SSACK	R	0h	Spread Spectrum status 0x0 : Spread-spectrum Clocking is disabled on output clocks 0x1 : Spread-spectrum Clocking is enabled on output clocks
1	HIGHJITTER	R	0h	1 indicates jitter. After PHASELOCK is asserted high, the HIGHJITTER flag is asserted high if phase error between REFCLK and FBCLK greater than 24%.
0	BYPASS	R	1h	Bypass status signal. 1 CLKOUT in bypass

5.2.1.119 PLL_PER_HSDIVIDER Register (Offset = 864h) [Reset = 0000XXXh]

PLL_PER_HSDIVIDER is shown in [Table 5-122](#).

Return to the [Summary Table](#).

Bit	Field	Type	Reset	Description
31-15	RESERVED	R/W	0h	Reserved Reads return 0x0 and writes have no effect. 0x0 = Functional Reset
14	SLICER_APLL_BYPASS_DRV	R/W	0h	Slicer APLL Bypass Drive This bit controls the drive strength of the APLL Bypass Slicer 0 = Low-power drive 1 = High-power drive 0x0 = Functional Reset
13	SLICER_APLL_BYPASS	R/W	0h	Slicer APLL Bypass This bit enables a high-speed slicer connected to CLKM which can be used to drive a high-speed clock directly as the SYNTH reference clock. 0 = Normal operation (bypass slicer disabled) 1 = APLL Bypass Slicer Enabled 0x0 = Functional Reset
12	XTAL_DETECT_XO_SLICER	R/W	0h	XTAL Detect Enable This bit connects a pullup and sense circuitry to CLKM to detect the presence or absence of a crystal. This operation will conflict with oscillator functionality, so this bit must be asserted only when the oscillator is disabled (CTRL_CLKTOP_REG1 bit 2 must be '0'). After asserted, the internal XTAL_SENSE signal will reflect a '1' if a crystal is present (CLKM sees a high impedance) or '0' if CLKM is tied to ground. After the sense operation is detected, this bit must be cleared before the oscillator will function properly if enabled. 0 = Normal operation (pullup and sense circuitry are disconnected from CLKM, XTAL_SENSE outputs '1') 1 = XTAL sense function enabled (pullup and sense circuitry connected to CLKM, output of XTAL_SENSE reads '1' if high impedance, '0' if CLKM is tied to ground) 0x0 = Functional Reset
11	SLICER_DCCPL_XO_SLICER	R/W	0h	Slicer DC-Coupled Mode 0 = Normal operation (AC-couple CLKP to internal slicer) 1 = DC-couple CLKP to internal slicer to CLKP 0x0 = Functional Reset
10	SLICER_HIPWR_XO_SLICER	R/W	0h	Slicer High-power Mode This bit bypasses the input clock slicer current-starving/filtering circuitry to increase gain and reduce device phase-noise at the expense of power and reduced supply noise rejection. This permits the use of a high-speed external test clock (660MHz max). 0 = Normal operation (current-limiting present) 1 = High-power/high-speed test mode 0x0 = Functional Reset
9	FASTCHARGEZ_BIAS_XO_SLICER	R/W	0h	Bias Fast-charge Enable (Active Low) This bit bypasses the RC filtering on the XOSC/SLICER Bias to permit more rapid power-up. 0 = Bias fast-charge 1 = Normal operation (filtering present) 0x1 = Functional Reset
8-4	XOSC_DRIVE_XO_SLICER	R/W	0h	Crystal Oscillator Output Drive Binary-weighted oscillator drive control 0x0 = Functional Reset
3-0	RTRIM_BIAS_XO_SLICER	R/W	0h	Crystal Oscillator and Slicer Bias RTrim Binary-weighted bias control 0x0 = Functional Reset

Return to the [Summary Table](#).

Table 5-171. MSS_RST_CAUSE_CLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	clr	R/W	0h	Write pulse bit field: Clear bit for rst cause register (writing '111' will clear the rst cause register)

5.2.2.3 MSS_RST_STATUS Register (Offset = 8h) [Reset = 0000003h]

MSS_RST_STATUS is shown in [Table 5-172](#).

Return to the [Summary Table](#).

Table 5-172. MSS_RST_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-0	cause	R	3h	Has the status because of which reset has happened. Bit0: POR Reset Bit1: Warm Reset Bit2: STC Reset Bit3 Reset for CR5A and MSS_CR5A_VIM using MSS_RCM::MSS_CR5SSA_RST_CTRL Bit4: RESERVED Bit5: Reset for CR5A only using MSS_RCM::MSS_CR5A_RST_CTRL Bit6: RESERVED Bit7: Reset for CR5A and MSS_CR5A_VIM caused because of reset request by debugger in CR5A Bit8: RESERVED Bit9: Reset for CR5SS by the RESET FSM using MSS_CTRL::R5_CONTROL_RESET_FSM_TRIGGER

5.2.2.4 SYSRST_BY_DBG_RST Register (Offset = Ch) [Reset = 0000XXXh]

SYSRST_BY_DBG_RST is shown in [Table 5-173](#).

Return to the [Summary Table](#).

Table 5-173. SYSRST_BY_DBG_RST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-19	RESERVED	R/W	0h	
18-16	r5b	R/W	0h	RESERVED: Dont Use
15-3	RESERVED	R/W	0h	
2-0	r5a	R/W	0h	writing '111' will block debug reset request from CR5A toggling globally reset for CR5A

5.2.2.5 RST_ASSERDLY Register (Offset = 10h) [Reset = 000000Fh]

RST_ASSERDLY is shown in [Table 5-174](#).

Return to the [Summary Table](#).

Table 5-174. RST_ASSERDLY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R/W	0h	
7-0	common	R/W	Fh	Value decides number of cycles reset should be asserted for CR5SS related resets

5.2.2.6 RST2ASSERTDLY Register (Offset = 14h) [Reset = 0000000h]

RST2ASSERTDLY is shown in [Table 5-175](#).

Return to the [Summary Table](#).

Table 5-175. RST2ASSERTDLY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	r5b	R/W	0h	RESERVED: Dont Use
23-16	r5a	R/W	0h	Value decides number of cycles should be held before asserting reset for r5ss local reset for CR5A
15-8	r5ssb	R/W	0h	RESERVED: Dont Use
7-0	r5ssa	R/W	0h	Value decides number of cycles should be held before asserting reset for r5ss global reset for CR5A.

5.2.2.7 RST_WFICHECK Register (Offset = 18h) [Reset = 07XXXXXXh]

RST_WFICHECK is shown in [Table 5-176](#).

Return to the [Summary Table](#).

Table 5-176. RST_WFICHECK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R/W	0h	
26-24	r5b	R/W	7h	writing '000' will disable check for WFI before local reset assertion of CR5A
23-19	RESERVED	R/W	0h	
18-16	r5a	R/W	7h	writing '000' will disable check for WFI before local reset assertion of CR5A
15-11	RESERVED	R/W	0h	
10-8	r5ssb	R/W	7h	RESERVED: Dont Use
7-3	RESERVED	R/W	0h	
2-0	r5ssa	R/W	7h	writing '000' will disable check for WFI before global reset assertion of CR5A

5.2.2.8 MSS_QSPI_CLK_SRC_SEL Register (Offset = 24h) [Reset = 0000000h]

MSS_QSPI_CLK_SRC_SEL is shown in [Table 5-177](#).

Return to the [Summary Table](#).

Table 5-177. MSS_QSPI_CLK_SRC_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	clksrcsel	R/W	0h	Select line for selecting source clock for QSPI. Data should be loaded as multibit. For example: if '0x5' should be selected then '0x555' should be configured to the register. Refer to TPR12 clock spec for source clock reference

5.2.2.9 MSS_RTIA_CLK_SRC_SEL Register (Offset = 28h) [Reset = 0000000h]

MSS_RTIA_CLK_SRC_SEL is shown in [Table 5-178](#).

Return to the [Summary Table](#).

5.2.2.143 intr_raw_status Register (Offset = 1010h) [Reset = 0000000h]

intr_raw_status is shown in [Table 5-312](#).

Return to the [Summary Table](#).

Interrupt Raw Status/Set Register

Table 5-312. intr_raw_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	0h	
3	proxy_err	R/W1S	0h	Proxy0 access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
2	kick_err	R/W1S	0h	Kick access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
1	addr_err	R/W1S	0h	Addressing violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
0	prot_err	R/W1S	0h	Protection violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.

5.2.2.144 intr_enabled_status_clear Register (Offset = 1014h) [Reset = 0000000h]

intr_enabled_status_clear is shown in [Table 5-313](#).

Return to the [Summary Table](#).

Interrupt Enabled Status/Clear register

Table 5-313. intr_enabled_status_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	0h	
3	enabled_proxy_err	R/W1C	0h	Proxy0 access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
2	enabled_kick_err	R/W1C	0h	Kick access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
1	enabled_addr_err	R/W1C	0h	Addressing violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
0	enabled_prot_err	R/W1C	0h	Protection violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.

5.2.2.145 intr_enable Register (Offset = 1018h) [Reset = 0000000h]

intr_enable is shown in [Table 5-314](#).

Return to the [Summary Table](#).

Interrupt Enable register

Table 5-314. intr_enable Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	0h	
3	proxy_err_en	R/W1S	0h	Proxy0 access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
2	kick_err_en	R/W1S	0h	Kick access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
1	addr_err_en	R/W1S	0h	Addressing violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
0	prot_err_en	R/W1S	0h	Protection violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.

5.2.2.146 intr_enable_clear Register (Offset = 101Ch) [Reset = 0000000h]

intr_enable_clear is shown in [Table 5-315](#).

Return to the [Summary Table](#).

Interrupt Enable Clear register

Table 5-315. intr_enable_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	0h	
3	proxy_err_en_clr	R/W1C	0h	Proxy0 access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
2	kick_err_en_clr	R/W1C	0h	Kick access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
1	addr_err_en_clr	R/W1C	0h	Addressing violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
0	prot_err_en_clr	R/W1C	0h	Protection violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.

5.2.2.147 eoi Register (Offset = 1020h) [Reset = 0000000h]

eoi is shown in [Table 5-316](#).

Return to the [Summary Table](#).

EOI register

Table 5-316. eoi Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R/W	0h	
7-0	eoi_vector	R/W	0h	EOI vector value. Write this with interrupt distribution value in the chip.

5.2.2.148 fault_address Register (Offset = 1024h) [Reset = 00000000h]

fault_address is shown in [Table 5-317](#).

Return to the [Summary Table](#).

Fault Address register

Table 5-317. fault_address Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	fault_addr	R	0h	Fault Address.

5.2.2.149 fault_type_status Register (Offset = 1028h) [Reset = 00000000h]

fault_type_status is shown in [Table 5-318](#).

Return to the [Summary Table](#).

Fault Type Status register

Table 5-318. fault_type_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R	0h	
6	fault_ns	R	0h	Non-secure access.
5-0	fault_type	R	0h	Fault Type 10_0000 = Supervisor read fault - priv = 1 dir = 1 dtype ! = 1 01_0000 = Supervisor write fault - priv = 1 dir = 0 00_1000 = Supervisor execute fault - priv = 1 dir = 1 dtype = 1 00_0100 = User read fault - priv = 0 dir = 1 dtype = 1 00_0010 = User write fault - priv = 0 dir = 0 00_0001 = User execute fault - priv = 0 dir = 1 dtype = 1 00_0000 = No fault

5.2.2.150 fault_attr_status Register (Offset = 102Ch) [Reset = 0000000h]

fault_attr_status is shown in [Table 5-319](#).

Return to the [Summary Table](#).

Fault Attribute Status register

Table 5-319. fault_attr_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	fault_xid	R	0h	XID.
19-8	fault_routeid	R	0h	Route ID.
7-0	fault_privid	R	0h	Privilege ID.

5.2.2.151 fault_clear Register (Offset = 1030h) [Reset = 0000000h]

fault_clear is shown in [Table 5-320](#).

Return to the [Summary Table](#).

Fault Clear register

Table 5-320. fault_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	W	0h	
0	fault_clr	W	0h	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

5.2.3 DSS_RCM Registers

Table 5-321 lists the memory-mapped registers for the DSS_RCM registers. All register offset addresses not listed in Table 5-321 should be considered as reserved locations and the register contents should not be modified.

Table 5-321. DSS_RCM Registers

Offset	Acronym	Register Name	Section
0h	PID	PID register	Section 5.2.3.1
4h	HW_REG0		Section 5.2.3.2
8h	HW_REG1		Section 5.2.3.3
Ch	PREVIOUS_NAME		Section 5.2.3.4
10h	HW_REG3		Section 5.2.3.5
90h	DSS_HWA_CLK_SRC_SEL		Section 5.2.3.6
BCh	DSS_HWA_CLK_GATE		Section 5.2.3.7
D0h	DSS_CBUFF_CLK_GATE		Section 5.2.3.8
D8h	DSS_HWA_CLK_STATUS		Section 5.2.3.9
10Ch	DSS_MCRC_RST_CTRL		Section 5.2.3.10
118h	DSS_L3_BANKA0_PD_CTRL		Section 5.2.3.11
11Ch	DSS_L3_BANKA1_PD_CTRL		Section 5.2.3.12
128h	DSS_L3_BANKB0_PD_CTRL		Section 5.2.3.13
12Ch	DSS_L3_BANKB1_PD_CTRL		Section 5.2.3.14
158h	DSS_HWA_PD_CTRL		Section 5.2.3.15

100Ch	LOCK0_KICK1	- KICK1 component	Section 5.2.3.37
1010h	intr_raw_status	Interrupt Raw Status/Set Register	Section 5.2.3.38
1014h	intr_enabled_status_clear	Interrupt Enabled Status/Clear register	Section 5.2.3.39

Table 5-321. DSS_RCM Registers (continued)

Offset	Acronym	Register Name	Section
1018h	intr_enable	Interrupt Enable register	Section 5.2.3.40
101Ch	intr_enable_clear	Interrupt Enable Clear register	Section 5.2.3.41
1020h	eoi	EOI register	Section 5.2.3.42
1024h	fault_address	Fault Address register	Section 5.2.3.43
1028h	fault_type_status	Fault Type Status register	Section 5.2.3.44
102Ch	fault_attr_status	Fault Attribute Status register	Section 5.2.3.45
1030h	fault_clear	Fault Clear register	Section 5.2.3.46

Complex bit access types are encoded to fit into small table cells. [Table 5-322](#) shows the codes that are used for access types in this section.

Table 5-322. DSS_RCM Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

5.2.3.1 PID Register (Offset = 0h) [Reset = 61800214h]

PID is shown in [Table 5-323](#).

Return to the [Summary Table](#).

PID register

Table 5-323. PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PID_msb16	R	6180h	
15-11	PID_misc	R	0h	
10-8	PID_major	R	2h	
7-6	PID_custom	R	0h	
5-0	PID_minor	R	14h	

5.2.3.2 HW_REG0 Register (Offset = 4h) [Reset = 00000000h]

HW_REG0 is shown in [Table 5-324](#).

Return to the [Summary Table](#).

Table 5-324. HW_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

5.2.3.3 HW_REG1 Register (Offset = 8h) [Reset = 00000000h]

HW_REG1 is shown in [Table 5-325](#).

Return to the [Summary Table](#).

Table 5-325. HW_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

5.2.3.4 PREVIOUS_NAME Register (Offset = Ch) [Reset = 00000000h]

PREVIOUS_NAME is shown in [Table 5-326](#).

Return to the [Summary Table](#).

Table 5-326. PREVIOUS_NAME Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

5.2.3.5 HW_REG3 Register (Offset = 10h) [Reset = 0000000h]

HW_REG3 is shown in [Table 5-327](#).

Return to the [Summary Table](#).

Table 5-327. HW_REG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

5.2.3.6 DSS_HWA_CLK_SRC_SEL Register (Offset = 90h) [Reset = 0000000h]

DSS_HWA_CLK_SRC_SEL is shown in [Table 5-328](#).

Return to the [Summary Table](#).

Table 5-328. DSS_HWA_CLK_SRC_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	clksrcsel	R/W	0h	Select line for selecting source clock for DSS HWA. Data should be loaded as multibit. Write 3'b000 : TOPRCM_CR5_CLK Write 3'b111 : TOPRCM_SYS_CLK

5.2.3.7 DSS_HWA_CLK_GATE Register (Offset = BCh) [Reset = 0000000h]

DSS_HWA_CLK_GATE is shown in [Table 5-329](#).

Return to the [Summary Table](#).

Table 5-329. DSS_HWA_CLK_GATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	gated	R/W	0h	Clock gating config for DSS HWA Data should be loaded as multibit. Write 3'b000 : Clock is ungated Write 3'b111 : Clock is gated

5.2.3.8 DSS_CBUFF_CLK_GATE Register (Offset = D0h) [Reset = 0000000h]

DSS_CBUFF_CLK_GATE is shown in [Table 5-330](#).

Return to the [Summary Table](#).

Table 5-330. DSS_CBUFF_CLK_GATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	gated	R/W	0h	Clock gating config for DSS CBUFF Data should be loaded as multibit. Write 3'b000 : Clock is ungated Write 3'b111 : Clock is gated

5.2.3.9 DSS_HWA_CLK_STATUS Register (Offset = D8h) [Reset = 0000001h]

DSS_HWA_CLK_STATUS is shown in [Table 5-331](#).

Return to the [Summary Table](#).

Table 5-331. DSS_HWA_CLK_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	0h	
1-0	clkinuse	R	1h	Status shows the source clock selected for DSS HWA Clock

5.2.3.10 DSS_MCRC_RST_CTRL Register (Offset = 10Ch) [Reset = 0000000h]

DSS_MCRC_RST_CTRL is shown in [Table 5-332](#).

Return to the [Summary Table](#).

Table 5-332. DSS_MCRC_RST_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	assert	R/W	0h	This feature is for debug purpose only. Software needs to ensure the state of Device/IP before configuring. Writing 3'b11 will assert reset for DSS MCRC

5.2.3.11 DSS_L3_BANKA0_PD_CTRL Register (Offset = 118h) [Reset = 000007XXh]

DSS_L3_BANKA0_PD_CTRL is shown in [Table 5-333](#).

Return to the [Summary Table](#).

Table 5-333. DSS_L3_BANKA0_PD_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R/W	0h	
10-8	agoodin	R/W	7h	SW Control for <IP>_PD_CTRL Memory Array Power up CRTL1
7	RESERVED	R/W	0h

0	aonout	R	1h	Status for <IP>_PD_CTRL Memory Array Power up CTRL0

5.2.3.21 DSS_L3_PD_CTRL_STICKYBIT Register (Offset = 1B0h) [Reset = 0000000h]

DSS_L3_PD_CTRL_STICKYBIT is shown in [Table 5-343](#).

Return to the [Summary Table](#).

Table 5-343. DSS_L3_PD_CTRL_STICKYBIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	set	R/W	0h	Sticky bit for DSS L3 PD CTRL. Write 3'b111 to lock the configuration of DSS_L3_BANK*_PD_CTRL. Once this field is written, there is no impact of changing the value of aonin and agoodin fields in DSS_L3_BANK*_PD_CTRL registers

5.2.3.22 DSS_HWA_RST_CTRL Register (Offset = 1C8h) [Reset = 0000000h]

DSS_HWA_RST_CTRL is shown in [Table 5-344](#).

Return to the [Summary Table](#).

Table 5-344. DSS_HWA_RST_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	assert	R/W	0h	This register is for Debug Purposes only. Reset control for DSS HWA Data should be loaded as multibit. Write 3'b000: Reset is not asserted by SW. There could be another reset source which could reset the module. Refer to RCM spec for more details Write 3'b111 : Reset is asserted by SW

5.2.3.23 DSS_EDMA_RST_CTRL Register (Offset = 1D8h) [Reset = 000000Xh]

DSS_EDMA_RST_CTRL is shown in [Table 5-345](#).

Return to the [Summary Table](#).

Table 5-345. DSS_EDMA_RST_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R/W	0h	
6-4	assert_tc1	R/W	0h	This register is for Debug Purposes only. Reset control for DSS TPTCA1 Data should be loaded as multibit. Write 3'b000: Reset is not asserted by SW. There could be another reset source which could reset the module. Refer to RCM spec for more details Write 3'b111 : Reset is asserted by SW
3	RESERVED	R/W	0h	
2-0	assert_tc0	R/W	0h	This register is for Debug Purposes only. Reset control for DSS TPTCA0 Data should be loaded as multibit. Write 3'b000: Reset is not asserted by SW. There could be another reset source which could reset the module. Refer to RCM spec for more details Write 3'b111 : Reset is asserted by SW

5.2.3.24 DSS_CSI_CLK_GATE Register (Offset = 1E4h) [Reset = 0000000h]

DSS_CSI_CLK_GATE is shown in [Table 5-346](#).

Return to the [Summary Table](#).

Table 5-346. DSS_CSI_CLK_GATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	gated	R/W	0h	Clock gating config for DSS CSI2-TX Data should be loaded as multibit. Write 3'b000 : Clock is ungated Write 3'b111 : Clock is gated

5.2.3.25 DSS_IP_CLK_CFG Register (Offset = 1E8h) [Reset = 0000000h]

DSS_IP_CLK_CFG is shown in [Table 5-347](#).

Return to the [Summary Table](#).

Table 5-347. DSS_IP_CLK_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	gate	R/W	0h	IP clock gating configuration bits. Data should be loaded as multibit. Writing 3'b111 will gate the IP and disable the slave 2:0 - MCRC

5.2.3.26 HW_SPARE_RW0 Register (Offset = FD0h) [Reset = 0000000h]

HW_SPARE_RW0 is shown in [Table 5-348](#).

Return to the [Summary Table](#).

Table 5-348. HW_SPARE_RW0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw0	R/W	0h	Reserved for HW R&D

1030h	fault_clear	Fault Clear register	Section 5.2.4.36

Complex bit access types are encoded to fit into small table cells. Table 5-370 shows the codes that are used for access types in this section.

Table 5-370. RSS_RCM Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

5.2.4.1 PID Register (Offset = 0h) [Reset = 61800214h]

PID is shown in [Table 5-371](#).

Return to the [Summary Table](#).

PID register

Table 5-371. PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PID_msb16	R	6180h	
15-11	PID_misc	R	0h	
10-8	PID_major	R	2h	
7-6	PID_custom	R	0h	
5-0	PID_minor	R	14h	

5.2.4.2 HW_REG0 Register (Offset = 4h) [Reset = 00000000h]

HW_REG0 is shown in [Table 5-372](#).

Return to the [Summary Table](#).

Table 5-372. HW_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

5.2.4.3 HW_REG1 Register (Offset = 8h) [Reset = 00000000h]

HW_REG1 is shown in [Table 5-373](#).

Return to the [Summary Table](#).

Table 5-373. HW_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

5.2.4.4 PREVIOUS_NAME Register (Offset = Ch) [Reset = 00000000h]

PREVIOUS_NAME is shown in [Table 5-374](#).

Return to the [Summary Table](#).

Table 5-374. PREVIOUS_NAME Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

5.2.4.5 HW_REG3 Register (Offset = 10h) [Reset = 0000000h]

HW_REG3 is shown in [Table 5-375](#).

Return to the [Summary Table](#).

Table 5-375. HW_REG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg	R/W	0h	HW Reserved regiser

5.2.4.6 RSS_BSS_SYS_CLK_GATE Register (Offset = 18h) [Reset = 0000000h]

RSS_BSS_SYS_CLK_GATE is shown in [Table 5-376](#).

Return to the [Summary Table](#).

Table 5-376. RSS_BSS_SYS_CLK_GATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	gated	R/W	0h	Clock gating config for RSS BSS Data should be loaded as multibit. Write 3'b000 : Clock is ungated Write 3'b111 : Clock is gated

5.2.4.7 RSS_EDMA_RST_CTRL Register (Offset = 20h) [Reset = 00000XXh]

RSS_EDMA_RST_CTRL is shown in [Table 5-377](#).

Return to the [Summary Table](#).

Table 5-377. RSS_EDMA_RST_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R/W	0h	
10-8	tptca0_assert	R/W	0h	writing '111' will reset MSS_TPCCA
7	RESERVED	R/W	0h	
6-4	tpcca_assert	R/W	0h	This feature is for debug pupose only. software need to ensure the correct state of Device/IP before configuring this reset control for RSS EDMA Data should be loaded as multibit. Write 3'b000: Reset is not asserted by SW. There could be another reset source which could reset the module. Refer to RCM spec for more details Write 3'b111 : Reset is asserted by SW
3	RESERVED	R/W	0h	
2-0	assert	R/W	0h	This feature is for debug pupose only. software need to ensure the correct state of Device/IP before configuring this reset control for RSS EDMA Data should be loaded as multibit. Write 3'b000: Reset is not asserted by SW. There could be another reset source which could reset the module. Refer to RCM spec for more details Write 3'b111 : Reset is asserted by SW

5.2.4.8 RSS_BSS_RST_CTRL Register (Offset = 24h) [Reset = 00000000h]

RSS_BSS_RST_CTRL is shown in [Table 5-378](#).

Return to the [Summary Table](#).

Table 5-378. RSS_BSS_RST_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	assert	R/W	0h	This feature is for debug pupose only. software need to ensure the correct state of Device/IP before configuring this reset control for RSS BSS Data should be loaded as multibit. Write 3'b000: Reset is not asserted by SW. There could be another reset source which could reset the module. Refer to RCM spec for more details Write 3'b111 : Reset is asserted by SW

5.2.4.9 RSS_FRC_CLK_SRC_SEL Register (Offset = 28h) [Reset = 0000000h]

RSS_FRC_CLK_SRC_SEL is shown in [Table 5-379](#).

Return to the [Summary Table](#).

Table 5-379. RSS_FRC_CLK_SRC_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	clksrcsel	R/W	0h	Select line for selecting source clock for FRC. Data should be loaded as multibit. For example: if '0x5' should be selected then '0x555' should be configured to the register. Refer to TPR12 clock spec for source clock reference

5.2.4.10 RSS_FRC_CLK_GATE Register (Offset = 2Ch) [Reset = 0000000h]

RSS_FRC_CLK_GATE is shown in [Table 5-380](#).

Return to the [Summary Table](#).

Table 5-380. RSS_FRC_CLK_GATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	gated	R/W	0h	writing 3'b111 will gate the clock for FRC

5.2.4.11 RSS_FRC_CLK_DIV_VAL Register (Offset = 30h) [Reset = 0000000h]

RSS_FRC_CLK_DIV_VAL is shown in [Table 5-381](#).

Return to the [Summary Table](#).

Table 5-381. RSS_FRC_CLK_DIV_VAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	clkdivr	R/W	0h	Divider value for FRC selected clock. Data should be loaded as multibit. For example: if divider value of 8(1000) should be selected then '100010001000' should be configured to the register. Refer to TPR12 clock planner for clock reference

5.2.4.12 RSS_FRC_CLK_STATUS Register (Offset = 34h) [Reset = 0000001h]

RSS_FRC_CLK_STATUS is shown in [Table 5-382](#).

Return to the [Summary Table](#).

Table 5-382. RSS_FRC_CLK_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-8	currdivider	R	0h	Status shows the current divider value chosen for FRC
7-0	clkinuse	R	1h	Status shows the source clock selected for FRC

5.2.4.13 RSS_FRC_RST_CTRL Register (Offset = 38h) [Reset = 0000000h]

RSS_FRC_RST_CTRL is shown in [Table 5-383](#).

Return to the [Summary Table](#).

Table 5-383. RSS_FRC_RST_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	assert	R/W	0h	This feature is for debug pupose only. software need to ensure the correct state of Device/IP before configuring this reset control for RSS FRC Data should be loaded as multibit. Write 3'b000: Reset is not asserted by SW. There could be another reset source which could reset the module. Refer to RCM spec for more details Write 3'b111 : Reset is asserted by SW

5.2.4.14 RSS_IP_CLK_CFG Register (Offset = 3Ch) [Reset = 0000000h]

RSS_IP_CLK_CFG is shown in [Table 5-384](#).

Return to the [Summary Table](#).

Table 5-384. RSS_IP_CLK_CFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	gate	R/W	0h	IP clock gating configuration bits Writing 3'b111 will gate the IP

5.2.4.15 RSS_IP_ACCESS_DIS Register (Offset = 40h) [Reset = 0000000h]

RSS_IP_ACCESS_DIS is shown in [Table 5-385](#).

Return to the [Summary Table](#).

Table 5-385. RSS_IP_ACCESS_DIS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	disable	R/W	0h	IP access disable configuration bits Writing 3'b111 will disable the IP

5.2.4.16 HW_SPARE_RW0 Register (Offset = FD0h) [Reset = 0000000h]

HW_SPARE_RW0 is shown in [Table 5-386](#).

Return to the [Summary Table](#).

Table 5-386. HW_SPARE_RW0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw0	R/W	0h	Reserved for HW R&D

5.2.4.17 HW_SPARE_RW1 Register (Offset = FD4h) [Reset = 0000000h]

HW_SPARE_RW1 is shown in [Table 5-387](#).

Return to the [Summary Table](#).

Table 5-387. HW_SPARE_RW1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw1	R/W	0h	Reserved for HW R&D

5.2.4.18 HW_SPARE_RW2 Register (Offset = FD8h) [Reset = 0000000h]

HW_SPARE_RW2 is shown in [Table 5-388](#).

Return to the [Summary Table](#).

Table 5-388. HW_SPARE_RW2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw2	R/W	0h	Reserved for HW R&D

5.2.4.19 HW_SPARE_RW3 Register (Offset = FDCh) [Reset = 0000000h]

HW_SPARE_RW3 is shown in [Table 5-389](#).

Return to the [Summary Table](#).

Table 5-389. HW_SPARE_RW3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_rw3	R/W	0h	Reserved for HW R&D

5.2.4.20 HW_SPARE_RO0 Register (Offset = FE0h) [Reset = 00000000h]

HW_SPARE_RO0 is shown in [Table 5-390](#).

Return to the [Summary Table](#).

Table 5-390. HW_SPARE_RO0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro0	R	0h	Reserved for HW R&D

5.2.4.21 HW_SPARE_RO1 Register (Offset = FE4h) [Reset = 00000000h]

HW_SPARE_RO1 is shown in [Table 5-391](#).

Return to the [Summary Table](#).

Table 5-391. HW_SPARE_RO1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro1	R	0h	Reserved for HW R&D

5.2.4.22 HW_SPARE_RO2 Register (Offset = FE8h) [Reset = 00000000h]

HW_SPARE_RO2 is shown in [Table 5-392](#).

Return to the [Summary Table](#).

Table 5-392. HW_SPARE_RO2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro2	R	0h	Reserved for HW R&D

5.2.4.23 HW_SPARE_RO3 Register (Offset = FECh) [Reset = 0000000h]

HW_SPARE_RO3 is shown in [Table 5-393](#).

Return to the [Summary Table](#).

Table 5-393. HW_SPARE_RO3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_ro3	R	0h	Reserved for HW R&D

5.2.4.24 HW_SPARE_WPH Register (Offset = FF0h) [Reset = 0000000h]

HW_SPARE_WPH is shown in [Table 5-394](#).

Return to the [Summary Table](#).

Table 5-394. HW_SPARE_WPH Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hw_spare_wph	R/W	0h	Reserved for HW R&D

5.2.4.25 HW_SPARE_REC Register (Offset = FF4h) [Reset = 0000000h]

HW_SPARE_REC is shown in [Table 5-395](#).

Return to the [Summary Table](#).

Table 5-395. HW_SPARE_REC Register Field Descriptions

Bit	Field	Type	Reset	Description
31	hw_spare_rec31	R/W	0h	Reserved for HW R&D
30	hw_spare_rec30	R/W	0h	Reserved for HW R&D
29	hw_spare_rec29	R/W	0h	Reserved for HW R&D
28	hw_spare_rec28	R/W	0h	Reserved for HW R&D
27	hw_spare_rec27	R/W	0h	Reserved for HW R&D
26	hw_spare_rec26	R/W	0h	Reserved for HW R&D
25	hw_spare_rec25	R/W	0h	Reserved for HW R&D
24	hw_spare_rec24	R/W	0h	Reserved for HW R&D
23	hw_spare_rec23	R/W	0h	Reserved for HW R&D
22	hw_spare_rec22	R/W	0h	Reserved for HW R&D
21	hw_spare_rec21	R/W	0h	Reserved for HW R&D
20	hw_spare_rec20	R/W	0h	Reserved for HW R&D
19	hw_spare_rec19	R/W	0h	Reserved for HW R&D
18	hw_spare_rec18	R/W	0h	Reserved for HW R&D
17	hw_spare_rec17	R/W	0h	Reserved for HW R&D
16	hw_spare_rec16	R/W	0h	Reserved for HW R&D
15	hw_spare_rec15	R/W	0h	Reserved for HW R&D
14	hw_spare_rec14	R/W	0h	Reserved for HW R&D
13	hw_spare_rec13	R/W	0h	Reserved for HW R&D
12	hw_spare_rec12	R/W	0h	Reserved for HW R&D
11	hw_spare_rec11	R/W	0h	Reserved for HW R&D
10	hw_spare_rec10	R/W	0h	Reserved for HW R&D
9	hw_spare_rec9	R/W	0h	Reserved for HW R&D
8	hw_spare_rec8	R/W	0h	Reserved for HW R&D
7	hw_spare_rec7	R/W	0h	Reserved for HW R&D
6	hw_spare_rec6	R/W	0h	Reserved for HW R&D
5	hw_spare_rec5	R/W	0h	Reserved for HW R&D
4	hw_spare_rec4	R/W	0h	Reserved for HW R&D
3	hw_spare_rec3	R/W	0h	Reserved for HW R&D
2	hw_spare_rec2	R/W	0h	Reserved for HW R&D
1	hw_spare_rec1	R/W	0h	Reserved for HW R&D
0	hw_spare_rec0	R/W	0h	Reserved for HW R&D

5.2.4.26 LOCK0_KICK0 Register (Offset = 1008h) [Reset = 00000000h]

LOCK0_KICK0 is shown in [Table 5-396](#).

Return to the [Summary Table](#).

- KICK0 component

Table 5-396. LOCK0_KICK0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LOCK0_kick0	R/W	0h	- KICK0 component

5.2.4.27 LOCK0_KICK1 Register (Offset = 100Ch) [Reset = 00000000h]

LOCK0_KICK1 is shown in [Table 5-397](#).

Return to the [Summary Table](#).

- KICK1 component

Table 5-397. LOCK0_KICK1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	LOCK0_kick1	R/W	0h	- KICK1 component

5.2.4.28 intr_raw_status Register (Offset = 1010h) [Reset = 0000000h]

intr_raw_status is shown in [Table 5-398](#).

Return to the [Summary Table](#).

Interrupt Raw Status/Set Register

Table 5-398. intr_raw_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	0h	
3	proxy_err	R/W1S	0h	Proxy0 access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
2	kick_err	R/W1S	0h	Kick access violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
1	addr_err	R/W1S	0h	Addressing violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
0	prot_err	R/W1S	0h	Protection violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.

5.2.4.29 intr_enabled_status_clear Register (Offset = 1014h) [Reset = 00000000h]

intr_enabled_status_clear is shown in [Table 5-399](#).

Return to the [Summary Table](#).

Interrupt Enabled Status/Clear register

Table 5-399. intr_enabled_status_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	0h	
3	enabled_proxy_err	R/W1C	0h	Proxy0 access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
2	enabled_kick_err	R/W1C	0h	Kick access violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
1	enabled_addr_err	R/W1C	0h	Addressing violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
0	enabled_prot_err	R/W1C	0h	Protection violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.

5.2.4.30 intr_enable Register (Offset = 1018h) [Reset = 0000000h]

intr_enable is shown in [Table 5-400](#).

Return to the [Summary Table](#).

Interrupt Enable register

Table 5-400. intr_enable Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	0h	
3	proxy_err_en	R/W1S	0h	Proxy0 access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
2	kick_err_en	R/W1S	0h	Kick access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
1	addr_err_en	R/W1S	0h	Addressing violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
0	prot_err_en	R/W1S	0h	Protection violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.

5.2.4.31 intr_enable_clear Register (Offset = 101Ch) [Reset = 0000000h]

intr_enable_clear is shown in [Table 5-401](#).

Return to the [Summary Table](#).

Interrupt Enable Clear register

Table 5-401. intr_enable_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	0h	
3	proxy_err_en_clr	R/W1C	0h	Proxy0 access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
2	kick_err_en_clr	R/W1C	0h	Kick access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
1	addr_err_en_clr	R/W1C	0h	Addressing violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
0	prot_err_en_clr	R/W1C	0h	Protection violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.

5.2.4.32 eoi Register (Offset = 1020h) [Reset = 00000000h]

eoi is shown in [Table 5-402](#).

Return to the [Summary Table](#).

EOI register

Table 5-402. eoi Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R/W	0h	
7-0	eoi_vector	R/W	0h	EOI vector value. Write this with interrupt distribution value in the chip.

5.2.4.33 fault_address Register (Offset = 1024h) [Reset = 00000000h]

fault_address is shown in [Table 5-403](#).

Return to the [Summary Table](#).

Fault Address register

Table 5-403. fault_address Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	fault_addr	R	0h	Fault Address.

5.2.4.34 fault_type_status Register (Offset = 1028h) [Reset = 00000000h]

fault_type_status is shown in [Table 5-404](#).

Return to the [Summary Table](#).

Fault Type Status register

Table 5-404. fault_type_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R	0h	
6	fault_ns	R	0h	Non-secure access.
5-0	fault_type	R	0h	Fault Type 10_0000 = Supervisor read fault - priv = 1 dir = 1 dtype ! = 1 01_0000 = Supervisor write fault - priv = 1 dir = 0 00_1000 = Supervisor execute fault - priv = 1 dir = 1 dtype = 1 00_0100 = User read fault - priv = 0 dir = 1 dtype = 1 00_0010 = User write fault - priv = 0 dir = 0 00_0001 = User execute fault - priv = 0 dir = 1 dtype = 1 00_0000 = No fault

5.2.4.35 fault_attr_status Register (Offset = 102Ch) [Reset = 0000000h]

fault_attr_status is shown in [Table 5-405](#).

Return to the [Summary Table](#).

Fault Attribute Status register

Table 5-405. fault_attr_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	fault_xid	R	0h	XID.
19-8	fault_routeid	R	0h	Route ID.
7-0	fault_privid	R	0h	Privilege ID.

5.2.4.36 fault_clear Register (Offset = 1030h) [Reset = 0000000h]

fault_clear is shown in [Table 5-406](#).

Return to the [Summary Table](#).

Fault Clear register

Table 5-406. fault_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	W	0h	
0	fault_clr	W	0h	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

5.2.5 DSS_CTRL Registers

Table 5-407 lists the memory-mapped registers for the DSS_CTRL registers. All register offset addresses not listed in Table 5-407 should be considered as reserved locations and the register contents should not be modified.

Table 5-407. DSS_CTRL Registers

Offset	Acronym	Register Name	Section
0h	PID	PID register	Section 5.2.5.1
4h	HW_REG0		Section 5.2.5.2

Complex bit access types are encoded to fit into small table cells. [Table 5-408](#) shows the codes that are used for access types in this section.

Table 5-408. DSS_CTRL Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

5.2.5.1 PID Register (Offset = 0h) [Reset = 61800214h]

PID is shown in [Table 5-409](#).

Return to the [Summary Table](#).

PID register

Table 5-409. PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PID_msb16	R	6180h	
15-11	PID_misc	R	0h	
10-8	PID_major	R	2h	
7-6	PID_custom	R	0h	
5-0	PID_minor	R	14h	

5.2.5.2 HW_REG0 Register (Offset = 4h) [Reset = 00000000h]

HW_REG0 is shown in [Table 5-410](#).

Return to the [Summary Table](#).

Table 5-410. HW_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg0	R/W	0h	Reserved for R&D

5.2.5.3 HW_REG1 Register (Offset = 8h) [Reset = 00000000h]

HW_REG1 is shown in [Table 5-411](#).

Return to the [Summary Table](#).

Table 5-411. HW_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg1	R/W	0h	Reserved for R&D

5.2.5.4 PREVIOUS_NAME Register (Offset = Ch) [Reset = 00000000h]

PREVIOUS_NAME is shown in [Table 5-412](#).

Return to the [Summary Table](#).

Table 5-412. PREVIOUS_NAME Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg2	R/W	0h	Reserved for R&D

5.2.5.5 HW_REG3 Register (Offset = 10h) [Reset = 0000000h]

HW_REG3 is shown in [Table 5-413](#).

Return to the [Summary Table](#).

Table 5-413. HW_REG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg3	R/W	0h	Reserved for R&D

5.2.5.6 DSS_SW_INT Register (Offset = 14h) [Reset = 0000000h]

DSS_SW_INT is shown in [Table 5-414](#).

Return to the [Summary Table](#).

Table 5-414. DSS_SW_INT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	0h	
3-0	dss_swint	R/W	0h	Write pulse bit field: DSS SW Interrupt Write 1 : Generate an interrupt on DSS_SW_INT0

5.2.5.7 DSS_TPCC_A_ERRAGG_MASK Register (Offset = 18h) [Reset = 00XXXX0h]

DSS_TPCC_A_ERRAGG_MASK is shown in [Table 5-415](#).

Return to the [Summary Table](#).

Table 5-415. DSS_TPCC_A_ERRAGG_MASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R/W	0h	
26	tptc_a1_read_access_error	R/W	0h	Mask Interrupt from DSS_TPTC_A1 to aggregated Interrupt DSS_TPCC_A_INTAGG 1 : Interrupt is Masked 0 : Interrupt is Unmasked

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2	tpcc_c_meminit_done	R/W	0h	RESERVED: Dont Use
1	tpcc_b_meminit_done	R/W	0h	RESERVED: Dont Use
0	tpcc_a_meminit_done	R/W	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of TPCC A Param memory is complte. Write 0x1 to clear status. Refer TPCC Memory initialization sequence in EDMA section for more details

5.2.5.16 DSS_L3RAM_MEMINIT_START Register (Offset = 98h) [Reset = 0000000h]

DSS_L3RAM_MEMINIT_START is shown in [Table 5-424](#).

Return to the [Summary Table](#).

Table 5-424. DSS_L3RAM_MEMINIT_START Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	0h	
3	l3ram3_meminit_start	R/W	0h	Start Memory initialization of TPCC A Param memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed. Before starting new initialization sequence ensure that there is no initialization sequence is in progress (ie L3RAM_MEMINIT_STATUS should be 0x0) and clear any previous completion status (ie write 0x1 to clear L3RAM_MEMINIT_DONE)
2	l3ram2_meminit_start	R/W	0h	Write pulse bit field: Start Memory initialization of TPCC A Param memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed. Before starting new initialization sequence ensure that there is no initialization sequence is in progress (ie L3RAM_MEMINIT_STATUS should be 0x0) and clear any previous completion status (ie write 0x1 to clear L3RAM_MEMINIT_DONE)
1	l3ram1_meminit_start	R/W	0h	Write pulse bit field: Start Memory initialization of TPCC A Param memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed. Before starting new initialization sequence ensure that there is no initialization sequence is in progress (ie L3RAM_MEMINIT_STATUS should be 0x0) and clear any previous completion status (ie write 0x1 to clear L3RAM_MEMINIT_DONE)
0	l3ram0_meminit_start	R/W	0h	Write pulse bit field: Start Memory initialization of TPCC A Param memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed. Before starting new initialization sequence ensure that there is no initialization sequence is in progress (ie L3RAM_MEMINIT_STATUS should be 0x0) and clear any previous completion status (ie write 0x1 to clear L3RAM_MEMINIT_DONE)

5.2.5.17 DSS_L3RAM_MEMINIT_STATUS Register (Offset = 9Ch) [Reset = 0000000h]

DSS_L3RAM_MEMINIT_STATUS is shown in [Table 5-425](#).

Return to the [Summary Table](#).

Table 5-425. DSS_L3RAM_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	0h	
3	l3ram3_meminit_status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of TPCC A Param memory is in progress.
2	l3ram2_meminit_status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of TPCC A Param memory is in progress.
1	l3ram1_meminit_status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of TPCC A Param memory is in progress.
0	l3ram0_meminit_status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of TPCC A Param memory is in progress.

5.2.5.18 DSS_L3RAM_MEMINIT_DONE Register (Offset = A0h) [Reset = 0000000h]

DSS_L3RAM_MEMINIT_DONE is shown in [Table 5-426](#).

Return to the [Summary Table](#).

Table 5-426. DSS_L3RAM_MEMINIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	0h	
3	l3ram3_meminit_done	R/W	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of TPCC A Param memory is complete. Write 0x1 to clear status. Refer TPCC Memory initialization sequence in EDMA section for more details
2	l3ram2_meminit_done	R/W	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of TPCC A Param memory is complete. Write 0x1 to clear status. Refer TPCC Memory initialization sequence in EDMA section for more details
1	l3ram1_meminit_done	R/W	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of TPCC A Param memory is complete. Write 0x1 to clear status. Refer TPCC Memory initialization sequence in EDMA section for more details
0	l3ram0_meminit_done	R/W	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of TPCC A Param memory is complete. Write 0x1 to clear status. Refer TPCC Memory initialization sequence in EDMA section for more details

5.2.5.19 DSS_TPCC_A_PARITY_CTRL Register (Offset = BCh) [Reset = 0000000h]

DSS_TPCC_A_PARITY_CTRL is shown in [Table 5-427](#).

Return to the [Summary Table](#).

Table 5-427. DSS_TPCC_A_PARITY_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2	parity_err_clr	R/W	0h	Write pulse bit field: Write 0x1 to clear the Parit Error status for TPCC
1	parity_testen	R/W	0h	Enable Parity Test for TPCC. Write 0x1 : Parity Test is enabled on PARAM memory
0	parity_en	R/W	0h	Enable Parity for TPCC. Write 0x1 : Parity is enabled on PARAM memory

5.2.5.20 DSS_TPCC_A_PARITY_STATUS Register (Offset = C8h) [Reset = 0000000h]

DSS_TPCC_A_PARITY_STATUS is shown in [Table 5-428](#).

Return to the [Summary Table](#).

Table 5-428. DSS_TPCC_A_PARITY_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	0h	
7-0	parity_addr	R	0h	TPCC Error Address at which Parity Error occurred

5.2.5.21 TPTC_DBS_CONFIG Register (Offset = D4h) [Reset = 000AAAAAh]

TPTC_DBS_CONFIG is shown in [Table 5-429](#).

Return to the [Summary Table](#).

Table 5-429. TPTC_DBS_CONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	RESERVED	R/W	0h	
19-18	tptc_c5	R/W	2h	RESERVED: Dont Use
17-16	tptc_c4	R/W	2h	RESERVED: Dont Use
15-14	tptc_c3	R/W	2h	RESERVED: Dont Use
13-12	tptc_c2	R/W	2h	RESERVED: Dont Use
11-10	tptc_c1	R/W	2h	RESERVED: Dont Use
9-8	tptc_c0	R/W	2h	RESERVED: Dont Use0

5-4	tptc_b0	R/W	2h	RESERVED: Dont Use
3-2	tptc_a1	R/W	2h	Max Burst size tieoff value for TPTC A1
1-0	tptc_a0	R/W	2h	Max Burst size tieoff value for TPTC A0

5.2.5.22 DSS_DSP_BOOTCFG Register (Offset = D8h) [Reset = 00X02000h]

DSS_DSP_BOOTCFG is shown in [Table 5-430](#).

Return to the [Summary Table](#).

Table 5-430. DSS_DSP_BOOTCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-26	RESERVED	R/W	0h	
25	L1P_CACHE_MODE	R/W	0h	DSP Boot Configuration : L1P Cache Mode
24	L1D_CACHE_MODE	R/W	0h	DSP Boot Configuration : L1D Cache Mode
23-22	RESERVED	R/W	0h	
21-0	ISTP_RST_VAL	R/W	2000h	DSP Boot Configuration : Reset Vector

5.2.5.23 DSS_DSP_NMI_GATE Register (Offset = DCh) [Reset = 0000000h]

DSS_DSP_NMI_GATE is shown in [Table 5-431](#).

Return to the [Summary Table](#).

Table 5-431. DSS_DSP_NMI_GATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	gate	R/W	0h	Write 3b111 to gate the Non Maskable Interrupt to the DSP. This is not expected to be used

5.2.5.24 DSS_PBIST_KEY_RESET Register (Offset = E0h) [Reset = 0000000h]

DSS_PBIST_KEY_RESET is shown in [Table 5-432](#).

Return to the [Summary Table](#).

Table 5-432. DSS_PBIST_KEY_RESET Register Field Descriptions

Bit	Field	Type	Reset	Description
31-9	RESERVED	R/W	0h	
8	dss_l2_pbist_st_key	R/W	0h	DSS L2 PBIST Selftest Key.
7-4	dss_pbist_st_reset	R/W	0h	DSS PBIST controller will be brought out of reset when value is 0xA
3-0	dss_pbist_st_key	R/W	0h	DSS PBIST Selftest Key. Valid value is 0x5

5.2.5.25 DSS_PBIST_REG0 Register (Offset = E4h) [Reset = 00000000h]

DSS_PBIST_REG0 is shown in [Table 5-433](#).

Return to the [Summary Table](#).

Table 5-433. DSS_PBIST_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	dss_pbist_reg0	R/W	0h	DSP PBIST registers

5.2.5.26 DSS_PBIST_REG1 Register (Offset = E8h) [Reset = 0000000h]

DSS_PBIST_REG1 is shown in [Table 5-434](#).

Return to the [Summary Table](#).

Table 5-434. DSS_PBIST_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	dss_pbist_reg1	R/W	0h	DSP PBIST registers

5.2.5.27 DSS_TPTC_BOUNDARY_CFG0 Register (Offset = ECh) [Reset = 12X2X2X2h]

DSS_TPTC_BOUNDARY_CFG0 is shown in [Table 5-435](#).

Return to the [Summary Table](#).

Table 5-435. DSS_TPTC_BOUNDARY_CFG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	RESERVED	R/W	0h	
29-24	tptc_b1_size	R/W	12h	RESERVED: Dont Use
23-22	RESERVED	R/W	0h	
21-16	tptc_b0_size	R/W	12h	RESERVED: Dont Use
15-14	RESERVED	R/W	0h	
13-8	tptc_a1_size	R/W	12h	6 bit signal used for deciding the boundary crossing size for CID-RID-SID reordering of TPTC Example: writing 6d19 decides boundary to be 2^{19} i.e. 512 KB
7-6	RESERVED	R/W	0h	
5-0	tptc_a0_size	R/W	12h	6 bit signal used for deciding the boundary crossing size for CID-RID-SID reordering of TPTC Example: writing 6d19 decides boundary to be 2^{19} i.e. 512 KB

5.2.5.28 DSS_TPTC_BOUNDARY_CFG1 Register (Offset = F0h) [Reset = 12X2X2X2h]

DSS_TPTC_BOUNDARY_CFG1 is shown in [Table 5-436](#).

Return to the [Summary Table](#).

Complex bit access types are encoded to fit into small table cells. [Table 5-477](#) shows the codes that are used for access types in this section.

Table 5-477. MSS_CTRL Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

5.2.6.1 PID Register (Offset = 0h) [Reset = 61800214h]

PID is shown in [Table 5-478](#).

Return to the [Summary Table](#).

PID register

Table 5-478. PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PID_msb16	R	6180h	
15-11	PID_misc	R	0h	
10-8	PID_major	R	2h	
7-6	PID_custom	R	0h	
5-0	PID_minor	R	14h	

5.2.6.2 MSS_SW_INT Register (Offset = 4h) [Reset = 0000000h]

MSS_SW_INT is shown in [Table 5-479](#).

Return to the [Summary Table](#).

Table 5-479. MSS_SW_INT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	0h	
4-0	pulse	R/W	0h	Write_pulse bit field: writing 1'b1 to each bit will trigger MSS_SW_INT<0-4> respectively to CR5A/B.

5.2.6.3 MSS_CAPEVNT_SEL Register (Offset = 8h) [Reset = 0000000h]

MSS_CAPEVNT_SEL is shown in [Table 5-480](#).

Return to the [Summary Table](#).

Table 5-480. MSS_CAPEVNT_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R/W	0h	
15-8	src1	R/W	0h	Writing a value 'N' will select Nth interrupt from CR5A/B interrupt mapping to trigger CAP-EVENT1 to all MSS_RTIs. Example: writing 8'h0A will select 10th interrupt to trigger CAP-EVENT1 to all MSS_RTIs. (which is MSS_RTIB_INT1)
7-0	src0	R/W	0h	Writing a value 'N' will select Nth interrupt from CR5A/B interrupt mapping to trigger CAP-EVENT0 to all MSS_RTIs. Example: writing 8'h0A will select 10th interrupt to trigger CAP-EVENT0 to all MSS_RTIs. (which is MSS_RTIB_INT1)

5.2.6.4 MSS_DMA_REQ_SEL Register (Offset = Ch) [Reset = 0000000h]

MSS_DMA_REQ_SEL is shown in [Table 5-481](#).

Return to the [Summary Table](#).

Table 5-481. MSS_DMA_REQ_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	select	R/W	0h	Reserved for R&D. Do not touch

5.2.6.5 MSS_DMA1_REQ_SEL Register (Offset = 10h) [Reset = 0000000h]

MSS_DMA1_REQ_SEL is shown in [Table 5-482](#).

Return to the [Summary Table](#).

Table 5-482. MSS_DMA1_REQ_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	select	R/W	0h	Reserved for R&D. Do not touch

5.2.6.6 MSS_IRQ_REQ_SEL Register (Offset = 14h) [Reset = 0000000h]

MSS_IRQ_REQ_SEL is shown in [Table 5-483](#).

Return to the [Summary Table](#).

Table 5-483. MSS_IRQ_REQ_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	select	R/W	0h	Reserved for R&D. Do not touch

5.2.6.7 MSS_SPI_TRIG_SRC Register (Offset = 18h) [Reset = 0000XXXXh]

MSS_SPI_TRIG_SRC is shown in [Table 5-484](#).

Return to the [Summary Table](#).

Table 5-484. MSS_SPI_TRIG_SRC Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R/W	0h	
26-16	trig_spib	R/W	0h	Writing 1'b1 to each bit will trigger MSS_SPIB Trigger<0-10> respectively
15-2	RESERVED	R/W	0h	
1-0	trig_spia	R/W	0h	RESERVED:Dont Touch

5.2.6.8 MSS_ATCM_MEM_INIT Register (Offset = 1Ch) [Reset = 0000000h]

MSS_ATCM_MEM_INIT is shown in [Table 5-485](#).

Return to the [Summary Table](#).

Table 5-485. MSS_ATCM_MEM_INIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	0h	
0	mem_init	R/W	0h	Write_pulse bit field: Writing 1'b1 will start initializing the ATCM banks of CR5A/B. Value in each row is initialized to 0x0C_0000_0000

5.2.6.9 MSS_ATCM_MEM_INIT_DONE Register (Offset = 20h) [Reset = 00000000h]

MSS_ATCM_MEM_INIT_DONE is shown in [Table 5-486](#).

Return to the [Summary Table](#).

Table 5-486. MSS_ATCM_MEM_INIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	0h	
0	mem_init_done	R/W	0h	This field will be high once initialization of ATCM banks is finished. Writing '1' would clear the bit.

Table 5-616. HW_REG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	mss_pcrA_timeout_cfg	R/W	FFh	Configures the timeout value for MSS_PCRA.

5.2.6.140 HW_REG5 Register (Offset = 52Ch) [Reset = 0000000h]

HW_REG5 is shown in [Table 5-617](#).

Return to the [Summary Table](#).

Table 5-617. HW_REG5 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg5	R/W	0h	HW reserved Register

5.2.6.141 HW_REG6 Register (Offset = 530h) [Reset = 0000000h]

HW_REG6 is shown in [Table 5-618](#).

Return to the [Summary Table](#).

Table 5-618. HW_REG6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg6	R/W	0h	HW reserved Register

5.2.6.142 HW_REG7 Register (Offset = 534h) [Reset = 0000000h]

HW_REG7 is shown in [Table 5-619](#).

Return to the [Summary Table](#).

Table 5-619. HW_REG7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	hwreg7	R/W	0h	HW reserved Register

5.2.6.143 MSS_CR5A_AHB_BUS_SAFETY_CTRL Register (Offset = 5B8h) [Reset = 0000XXXXh]

MSS_CR5A_AHB_BUS_SAFETY_CTRL is shown in [Table 5-620](#).

Return to the [Summary Table](#).

Table 5-620. MSS_CR5A_AHB_BUS_SAFETY_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R/W	0h	
23-16	type	R	0h	Refer to TPR12 Substem Microarch document for more details
15-9	RESERVED	R/W	0h	
8	err_clear	R/W	0h	Refer to TPR12 Substem Microarch document for more details
7-3	RESERVED	R/W	0h	
2-0	enable	R/W	7h	Refer to TPR12 Substem Microarch document for more details

5.2.6.144 MSS_CR5A_AHB_BUS_SAFETY_FI Register (Offset = 5BCh) [Reset = 00000X0h]

MSS_CR5A_AHB_BUS_SAFETY_FI is shown in [Table 5-621](#).

Return to the [Summary Table](#).

Table 5-621. MSS_CR5A_AHB_BUS_SAFETY_FI Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	safe	R/W	0h	Refer to TPR12 Substem Microarch document for more details
23-16	main	R/W	0h	Refer to TPR12 Substem Microarch document for more details
15-8	data	R/W	0h	Refer to TPR12 Substem Microarch document for more details
7-6	RESERVED	R/W	0h	
5	ded	R/W	0h	Refer to TPR12 Substem Microarch document for more details
4	sec	R/W	0h	Refer to TPR12 Substem Microarch document for more details
3	global_safe_req	R/W	0h	Refer to TPR12 Substem Microarch document for more details
2	global_main_req	R/W	0h	Refer to TPR12 Substem Microarch document for more details
1	global_safe	R/W	0h	Refer to TPR12 Substem Microarch document for more details
0	global_main	R/W	0h	Refer to TPR12 Substem Microarch document for more details

5.2.6.145 MSS_CR5A_AHB_BUS_SAFETY_ERR Register (Offset = 5C0h) [Reset = 0000000h]

MSS_CR5A_AHB_BUS_SAFETY_ERR is shown in [Table 5-622](#).

Return to the [Summary Table](#).

Table 5-622. MSS_CR5A_AHB_BUS_SAFETY_ERR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	ded	R	0h	Refer to TPR12 Substem Microarch document for more details
23-16	sec	R	0h	Refer to TPR12 Substem Microarch document for more details
15-8	comp_check	R	0h	Refer to TPR12 Substem Microarch document for more details
7-0	comp_err	R	0h	Refer to TPR12 Substem Microarch document for more details

5.2.6.146 MSS_CR5A_AHB_BUS_SAFETY_ERR_STAT_DATA0 Register (Offset = 5C4h) [Reset = 00000000h]

MSS_CR5A_AHB_BUS_SAFETY_ERR_STAT_DATA0 is shown in [Table 5-623](#).

Return to the [Summary Table](#).

Table 5-623. MSS_CR5A_AHB_BUS_SAFETY_ERR_STAT_DATA0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R	0h	
15-8	d1	R	0h	Refer to TPR12 Substem Microarch document for more details
7-0	d0	R	0h	Refer to TPR12 Substem Microarch document for more details

5.2.6.147 MSS_CR5A_AHB_BUS_SAFETY_ERR_STAT_CMD Register (Offset = 5C8h) [Reset = 00000000h]

MSS_CR5A_AHB_BUS_SAFETY_ERR_STAT_CMD is shown in [Table 5-624](#).

Return to the [Summary Table](#).

Table 5-624. MSS_CR5A_AHB_BUS_SAFETY_ERR_STAT_CMD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	stat	R	0h	Refer to TPR12 Substem Microarch document for more details

5.2.6.148 MSS_CR5A_AHB_BUS_SAFETY_ERR_STAT_WRITE Register (Offset = 5CCh) [Reset = 00000000h]

MSS_CR5A_AHB_BUS_SAFETY_ERR_STAT_WRITE is shown in [Table 5-625](#).

Return to the [Summary Table](#).

Table 5-625. MSS_CR5A_AHB_BUS_SAFETY_ERR_STAT_WRITE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	stat	R	0h	Refer to TPR12 Substem Microarch document for more details

5.2.6.149 MSS_CR5A_AHB_BUS_SAFETY_ERR_STAT_READ Register (Offset = 5D0h) [Reset = 00000000h]

MSS_CR5A_AHB_BUS_SAFETY_ERR_STAT_READ is shown in [Table 5-626](#).

Return to the [Summary Table](#).

Table 5-626. MSS_CR5A_AHB_BUS_SAFETY_ERR_STAT_READ Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	stat	R	0h	Refer to TPR12 Substem Microarch document for more details

5.2.6.150 MSS_CR5A_AHB_BUS_SAFETY_ERR_STAT_WRITERESP Register (Offset = 5D4h) [Reset = 0000000h]

MSS_CR5A_AHB_BUS_SAFETY_ERR_STAT_WRITERESP is shown in [Table 5-627](#).

Return to the [Summary Table](#).

Table 5-627. MSS_CR5A_AHB_BUS_SAFETY_ERR_STAT_WRITERESP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	stat	R	0h	Refer to TPR12 Substem Microarch document for more details

5.2.6.151 DMM_CTRL_REG Register (Offset = 5F8h) [Reset = 0000000h]

DMM_CTRL_REG is shown in [Table 5-628](#).

Return to the [Summary Table](#).

Table 5-628. DMM_CTRL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	0h	
0	dmm_pad_select	R/W	0h	0: SOC will be able to send the packet to DMMA/B 1: PAD will be able to send the packet to DMMA/B controlling from PAD

5.2.6.152 MSS_CR5A_MBOX_WRITE_DONE Register (Offset = 5FCh) [Reset = 0XXXXXXh]

MSS_CR5A_MBOX_WRITE_DONE is shown in [Table 5-629](#).

Return to the [Summary Table](#).

Table 5-629. MSS_CR5A_MBOX_WRITE_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	RESERVED	R/W	0h	
28	proc_7	R/W	0h	Write pulse bit field: This register should be written once finishing writing into the mailbox memory of processor 7
27-25	RESERVED	R/W	0h	
24	proc_6	R/W	0h	Write pulse bit field: This register should be written once finishing writing into the mailbox memory of processor 6
23-21	RESERVED	R/W	0h	
20	proc_5	R/W	0h	Write pulse bit field: This register should be written once finishing writing into the mailbox memory of processor 5
19-17	RESERVED	R/W	0h	
16	proc_4	R/W	0h	Write pulse bit field: This register should be written once finishing writing into the mailbox memory of processor 4
15-13	RESERVED	R/W	0h	
12	proc_3	R/W	0h	Write pulse bit field: This register should be written once finishing writing into the mailbox memory of processor 3
11-9	RESERVED	R/W	0h	
8	proc_2	R/W	0h	Write pulse bit field: This register should be written once finishing writing into the mailbox memory of processor 2
7-5	RESERVED	R/W	0h	
4	proc_1	R/W	0h	Write pulse bit field: This register should be written once finishing writing into the mailbox memory of processor 1
3-1	RESERVED	R/W	0h	
0	proc_0	R/W	0h	Write pulse bit field: This register should be written once finishing writing into the mailbox memory of processor 0

5.2.6.153 MSS_CR5A_MBOX_READ_REQ Register (Offset = 600h) [Reset = 0XXXXXXh]

MSS_CR5A_MBOX_READ_REQ is shown in [Table 5-630](#).

Return to the [Summary Table](#).

Table 5-630. MSS_CR5A_MBOX_READ_REQ Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	RESERVED	R/W	0h	
28	proc_7	R/W	0h	This is request from processor 7 to mss_cr5a. Requesting it to read from mailbox.
27-25	RESERVED	R/W	0h	
24	proc_6	R/W	0h	This is request from processor 6 to mss_cr5a. Requesting it to read from mailbox.
23-21	RESERVED	R/W	0h	
20	proc_5	R/W	0h	This is request from processor 5 to mss_cr5a. Requesting it to read from mailbox.
19-17	RESERVED	R/W	0h	
16	proc_4	R/W	0h	This is request from processor 4 to mss_cr5a. Requesting it to read from mailbox.
15-13	RESERVED	R/W	0h	
12	proc_3	R/W	0h	This is request from processor 3 to mss_cr5a. Requesting it to read from mailbox.
11-9	RESERVED	R/W	0h	
8	proc_2	R/W	0h	This is request from processor 2 to mss_cr5a. Requesting it to read from mailbox.
7-5	RESERVED	R/W	0h	
4	proc_1	R/W	0h	This is request from processor 1 to mss_cr5a. Requesting it to read from mailbox.
3-1	RESERVED	R/W	0h	
0	proc_0	R/W	0h	This is request from processor 0 to mss_cr5a. Requesting it to read from mailbox.

5.2.6.154 MSS_CR5A_MBOX_READ_DONE Register (Offset = 604h) [Reset = 0XXXXXXXh]

MSS_CR5A_MBOX_READ_DONE is shown in [Table 5-631](#).

Return to the [Summary Table](#).

Table 5-631. MSS_CR5A_MBOX_READ_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	RESERVED	R/W	0h	
28	proc_7	R/W	0h	This register should be written once finishing reading from CR5A's mailbox written by proc 7
27-25	RESERVED	R/W	0h	
24	proc_6	R/W	0h	This register should be written once finishing reading from CR5A's mailbox written by proc 6
23-21	RESERVED	R/W	0h	
20	proc_5	R/W	0h	This register should be written once finishing reading from CR5A's mailbox written by proc 5
19-17	RESERVED	R/W	0h	
16	proc_4	R/W	0h	This register should be written once finishing reading from CR5A's mailbox written by proc 4
15-13	RESERVED	R/W	0h	
12	proc_3	R/W	0h	This register should be written once finishing reading from CR5A's mailbox written by proc 3
11-9	RESERVED	R/W	0h	
8	proc_2	R/W	0h	This register should be written once finishing reading from CR5A's mailbox written by proc 2
7-5	RESERVED	R/W	0h	
4	proc_1	R/W	0h	This register should be written once finishing reading from CR5A's mailbox written by proc 1
3-1	RESERVED	R/W	0h	
0	proc_0	R/W	0h	This register should be written once finishing reading from CR5A's mailbox written by proc 0

5.2.6.155 MSS_PBIST_KEY_RST Register (Offset = 614h) [Reset = 0000000h]

MSS_PBIST_KEY_RST is shown in [Table 5-632](#).

Return to the [Summary Table](#).

Table 5-632. MSS_PBIST_KEY_RST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R/W	0h	
7-4	pbist_st_rst	R/W	0h	MSS PBIST controller will be brought out of reset when value is 0xA
3-0	pbist_st_key	R/W	0h	Top PBIST Selftest Key. Valid value is 0x5

5.2.6.156 MSS_PBIST_REG0 Register (Offset = 618h) [Reset = 0000000h]

MSS_PBIST_REG0 is shown in [Table 5-633](#).

Return to the [Summary Table](#).

Table 5-633. MSS_PBIST_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	pbist_reg	R/W	0h

MSS_PBIST_REG1 is shown in [Table 5-634](#).

Return to the [Summary Table](#).

Table 5-634. MSS_PBIST_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	pbist_reg	R/W	0h	

5.2.6.158 MSS_PBIST_REG2 Register (Offset = 620h) [Reset = 0000000h]

MSS_PBIST_REG2 is shown in [Table 5-635](#).

Return to the [Summary Table](#).

Table 5-635. MSS_PBIST_REG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	pbist_reg	R/W	0h	

5.2.6.159 MSS_QSPI_CONFIG Register (Offset = 624h) [Reset = 00000XXh]

MSS_QSPI_CONFIG is shown in [Table 5-636](#).

Return to the [Summary Table](#).

Table 5-636. MSS_QSPI_CONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R/W	0h	
10-8	clk_loopback	R/W	0h	Write 3'b111 to take board level loop back clock for QSPI
7-3	RESERVED	R/W	0h	
2-0	ext_clk	R/W	0h	Write 3'b111 to external clock as QSPI baud clock source needed for DFT IO char.

5.2.6.160 MSS_STC_CONTROL Register (Offset = 628h) [Reset = 00000000h]

MSS_STC_CONTROL is shown in [Table 5-637](#).

Return to the [Summary Table](#).

Table 5-637. MSS_STC_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	cr5_wfi_override	R/W	0h	writing 3'b111 will bypass the wfi signals from R5SS.

5.2.6.161 MSS_CTI_TRIG_SEL Register (Offset = 62Ch) [Reset = 0000000h]

MSS_CTI_TRIG_SEL is shown in [Table 5-638](#).

Return to the [Summary Table](#).

Table 5-638. MSS_CTI_TRIG_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R/W	0h	
7-0	trig8_sel	R/W	0h	Used for selecting the trigger source for 8th trigger of MSS_CTI

5.2.6.162 MSS_DBGSS_CTI_TRIG_SEL Register (Offset = 630h) [Reset = 0000000h]

MSS_DBGSS_CTI_TRIG_SEL is shown in [Table 5-639](#).

Return to the [Summary Table](#).

Table 5-639. MSS_DBGSS_CTI_TRIG_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	RESERVED	R/W	0h	
23-16	trig3	R/W	0h	Used for selecting the trigger source for 3rd trigger of ONE_MCU_CTI
15-8	trig2	R/W	0h	Used for selecting the trigger source for 2nd trigger of ONE_MCU_CTI
7-0	trig1	R/W	0h	Used for selecting the trigger source for 1st trigger of ONE_MCU_CTI

5.2.6.163 MSS_BOOT_INFO_REG0 Register (Offset = 634h) [Reset = 0000000h]

MSS_BOOT_INFO_REG0 is shown in [Table 5-640](#).

Return to the [Summary Table](#).

Table 5-640. MSS_BOOT_INFO_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	config	R/W	0h	Reserved Register for Software use

5.2.6.164 MSS_BOOT_INFO_REG1 Register (Offset = 638h) [Reset = 0000000h]

MSS_BOOT_INFO_REG1 is shown in [Table 5-641](#).

Return to the [Summary Table](#).

31-9	RESERVED	R/W	0h	
8	fe2_sel	R/W	0h	Writing 1'b0 : Selects MCANA filter event as HW_Sync_FE2 1'b1 : Selects MCANB filter event as HW_Sync_FE2
7-1	RESERVED	R/W	0h	
0	fe1_sel	R/W	0h	Writing 1'b0 : Selects MCANA filter event as HW_Sync_FE1 1'b1 : Selects MCANB filter event as HW_Sync_FE1

5.2.6.198 DEBUGSS_CSETB_FLUSH Register (Offset = 6C0h) [Reset = 00000XXh]

DEBUGSS_CSETB_FLUSH is shown in [Table 5-675](#).

Return to the [Summary Table](#).

Table 5-675. DEBUGSS_CSETB_FLUSH Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R/W	0h	
10	CSETB_FULL	R	0h	When HIGH indicates that the ETB RAM has overflowed or wrapped around to address zero
9	CSETB_ACQ_COMPLET E	R	0h	When HIGH, indicates that trace acquisition is complete by ETB, that is, the trigger counter is at zero
8	CSETB_FLUSHINACK	R	0h	Return acknowledgement to CSETBFLUSHIN
7-1	RESERVED	R/W	0h	
0	CSETB_FLUSHIN	R/W	0h	External control used to assert the ATB signal AFVALIDS and drain any historical FIFO information on the bus

5.2.6.199 ANALOG_WU_STATUS_REG_POLARITY_INV Register (Offset = 6C4h) [Reset = 00003D5Ch]

ANALOG_WU_STATUS_REG_POLARITY_INV is shown in [Table 5-676](#).

Return to the [Summary Table](#).

Table 5-676. ANALOG_WU_STATUS_REG_POLARITY_INV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	inv_ctrl	R/W	3D5Ch	This register decides the polarity of each status bit before providing to the MSS_ESM. Each bit controls the respective status bit.

5.2.6.200 ANALOG_CLK_STATUS_REG_POLARITY_INV Register (Offset = 6C8h) [Reset = 0000000h]

ANALOG_CLK_STATUS_REG_POLARITY_INV is shown in [Table 5-677](#).

Return to the [Summary Table](#).

Table 5-677. ANALOG_CLK_STATUS_REG_POLARITY_INV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	inv_ctrl	R/W	0h	This register decides the polarity of each status bit before providing to the MSS_ESM. Each bit controls the respective status bit.

5.2.6.201 ANALOG_WU_STATUS_REG_GRP1_MASK Register (Offset = 6CCh) [Reset = FFFFFFFFh]

ANALOG_WU_STATUS_REG_GRP1_MASK is shown in [Table 5-678](#).

Return to the [Summary Table](#).

Table 5-678. ANALOG_WU_STATUS_REG_GRP1_MASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	mask	R/W	FFFFFFFh	Writing 1'b1 : Masks the corresponding status bit before generating a group 1 ESM error. 1'b0 : Unmasks the corresponding status bit before generating a group 1 ESM error.

5.2.6.202 ANALOG_CLK_STATUS_REG_GRP1_MASK Register (Offset = 6D0h) [Reset = FFFFFFFFh]

ANALOG_CLK_STATUS_REG_GRP1_MASK is shown in [Table 5-679](#).

Return to the [Summary Table](#).

Table 5-679. ANALOG_CLK_STATUS_REG_GRP1_MASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	mask	R/W	FFFFFFFh	Writing 1'b1 : Masks the corresponding status bit before generating a group 1 ESM error. 1'b0 : Unmasks the corresponding status bit before generating a group 1 ESM error.

5.2.6.203 ANALOG_WU_STATUS_REG_GRP2_MASK Register (Offset = 6D4h) [Reset = FFFFFFFFh]

ANALOG_WU_STATUS_REG_GRP2_MASK is shown in [Table 5-680](#).

Return to the [Summary Table](#).

Table 5-680. ANALOG_WU_STATUS_REG_GRP2_MASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	mask	R/W	FFFFFFFh	Writing 1'b1 : Masks the corresponding status bit before generating a group 2 ESM error. 1'b0 : Unmasks the corresponding status bit before generating a group 2 ESM error.

5.2.6.204 ANALOG_CLK_STATUS_REG_GRP2_MASK Register (Offset = 6D8h) [Reset = FFFFFFFFh]

ANALOG_CLK_STATUS_REG_GRP2_MASK is shown in [Table 5-681](#).

Return to the [Summary Table](#).

Table 5-681. ANALOG_CLK_STATUS_REG_GRP2_MASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	mask	R/W	FFFFFFFh	Writing 1'b1 : Masks the corresponding status bit before generating a group 2 ESM error. 1'b0 : Unmasks the corresponding status bit before generating a group 2 ESM error.

5.2.6.205 NERROR_MASK Register (Offset = 6DCh) [Reset = 0000000h]

NERROR_MASK is shown in [Table 5-682](#).

Return to the [Summary Table](#).

Table 5-682. NERROR_MASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	mask	R/W	0h	writing 3'b111 will mask the Nerror propagation to pad Writing 3'b000 will unmask the Nerror propagation to pad

5.2.6.206 MSS2R5SS_BUS_SAFETY_CTRL Register (Offset = 6E0h) [Reset = 000FXXXh]

MSS2R5SS_BUS_SAFETY_CTRL is shown in [Table 5-683](#).

Return to the [Summary Table](#).

Bit	Field	Type	Reset	Description
31-16	RESERVED	R/W	0h	
15-0	undefined	R/W	0h	This denotes the last address of the data Read. This depends on the Packet size . Example : If packet size is 3072 bytes or 3KB and CRC is disabled , this needs to programmed as 3064 or hBF8 If packet size is 3072 bytes or 3KB and 16 bit CRC , this needs to be programmed as hC00 Address must be 4 byte aligned for 32 bit CRC Address must be 2 byte aligned for 16 bit CRC

5.2.6.254 R5_CONTROL Register (Offset = 800h) [Reset = 00XXXXXXh]

R5_CONTROL is shown in [Table 5-731](#).

Return to the [Summary Table](#).

Table 5-731. R5_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R/W	0h	
26-24	rom_wait_state	R/W	0h	writing '111' enables a single cycle wait state with respect to CR5A_clk for rom access. This needs to be set when R5 clock is at 400MHZ and Interconnect-clk is at 200MHZ. (because it is a timing issue in this scenario)
23-19	RESERVED	R/W	0h	
18-16	reset_fsm_trigger	R/W	0h	Write pulse bit field: writing 3'b111 will trigger the reset FSM. Reset FSM ensures reset to R5SS and inturn ensures the latching of lock_step and also mem_swap bit
15-11	RESERVED	R/W	0h	
10-8	lock_step_switch_wait	R/W	0h	writing 3'b111 ensures switch happens only after R5SS reset. Orelse it will be a immediate switch.
7-3	RESERVED	R/W	0h	
2-0	lock_step	R/W	7h	writing 3'b000 ensures R5 to be in Dual-Core mode. Note: The change happens after the R5SS reset assertion if R5_CONTROL_lock_step_switch_wait is set. Or else the switching to Dual-core happens on the fly.

5.2.6.255 R5_ROM_ECLIPSE Register (Offset = 804h) [Reset = 00000XXh]

R5_ROM_ECLIPSE is shown in [Table 5-732](#).

Return to the [Summary Table](#).

Table 5-732. R5_ROM_ECLIPSE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R/W	0h	
10-8	memswap_wait	R/W	0h	writing 3'b111 ensures ROM-Eclipsing happens only after R5SS reset. Orelse it will be a immediate change.
7-3	RESERVED	R/W	0h	
2-0	memswap	R/W	0h	writing '111' ensures eclipsing of CR5A_ROM immediately if memswap_wait is not set. If memswap_wait is set then ROM is eclipsed after R5SS reset assertion.

5.2.6.256 R5_COREA_HALT Register (Offset = 808h) [Reset = 0000007h]

R5_COREA_HALT is shown in [Table 5-733](#).

Return to the [Summary Table](#).

Table 5-733. R5_COREA_HALT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	halt	R/W	7h	writing '000' will unhalt CR5A. This register should be written only once.

5.2.6.257 R5_COREB_HALT Register (Offset = 80Ch) [Reset = 0000007h]

R5_COREB_HALT is shown in [Table 5-734](#).

Return to the [Summary Table](#).

Table 5-734. R5_COREB_HALT Register Field Descriptions

intr_enable is shown in [Table 5-750](#).

Return to the [Summary Table](#).

Interrupt Enable register

Table 5-750. intr_enable Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	0h	
3	proxy_err_en	R/W1S	0h	Proxy0 access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
2	kick_err_en	R/W1S	0h	Kick access violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
1	addr_err_en	R/W1S	0h	Addressing violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
0	prot_err_en	R/W1S	0h	Protection violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.

5.2.6.274 intr_enable_clear Register (Offset = 101Ch) [Reset = 0000000h]

intr_enable_clear is shown in [Table 5-751](#).

Return to the [Summary Table](#).

Interrupt Enable Clear register

Table 5-751. intr_enable_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	0h	
3	proxy_err_en_clr	R/W1C	0h	Proxy0 access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
2	kick_err_en_clr	R/W1C	0h	Kick access violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
1	addr_err_en_clr	R/W1C	0h	Addressing violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.
0	prot_err_en_clr	R/W1C	0h	Protection violation error enable clear. Write a 1 to clear the enable. Writing a 0 has no effect.

5.2.6.275 eoi Register (Offset = 1020h) [Reset = 00000000h]

eoi is shown in [Table 5-752](#).

Return to the [Summary Table](#).

EOI register

Table 5-752. eoi Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R/W	0h	
7-0	eoi_vector	R/W	0h	EOI vector value. Write this with interrupt distribution value in the chip.

5.2.6.276 fault_address Register (Offset = 1024h) [Reset = 00000000h]

fault_address is shown in [Table 5-753](#).

Return to the [Summary Table](#).

Fault Address register

Table 5-753. fault_address Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	fault_addr	R	0h	Fault Address.

5.2.6.277 fault_type_status Register (Offset = 1028h) [Reset = 0000000h]

fault_type_status is shown in [Table 5-754](#).

Return to the [Summary Table](#).

Fault Type Status register

Table 5-754. fault_type_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R	0h	
6	fault_ns	R	0h	Non-secure access.
5-0	fault_type	R	0h	Fault Type 10_0000 = Supervisor read fault - priv = 1 dir = 1 dtype ! = 1 01_0000 = Supervisor write fault - priv = 1 dir = 0 00_1000 = Supervisor execute fault - priv = 1 dir = 1 dtype = 1 00_0100 = User read fault - priv = 0 dir = 1 dtype = 1 00_0010 = User write fault - priv = 0 dir = 0 00_0001 = User execute fault - priv = 0 dir = 1 dtype = 1 00_0000 = No fault

5.2.6.278 fault_attr_status Register (Offset = 102Ch) [Reset = 00000000h]

fault_attr_status is shown in [Table 5-755](#).

Return to the [Summary Table](#).

Fault Attribute Status register

Table 5-755. fault_attr_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	fault_xid	R	0h	XID.
19-8	fault_routeid	R	0h	Route ID.
7-0	fault_privid	R	0h	Privilege ID.

5.2.6.279 fault_clear Register (Offset = 1030h) [Reset = 0000000h]

fault_clear is shown in [Table 5-756](#).

Return to the [Summary Table](#).

Fault Clear register

Table 5-756. fault_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	W	0h	
0	fault_clr	W	0h	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

5.2.7 RSS_CTRL Registers

Table 5-757 lists the memory-mapped registers for the RSS_CTRL registers. All register offset addresses not listed in Table 5-757 should be considered as reserved locations and the register contents should not be modified.

Table 5-757. RSS_CTRL Registers

Offset	Acronym	Register Name	Section
0h	PID	PID register	Section 5.2.7.1
8h	RSS_TPCC_A_ERRAGG_MASK		Section 5.2.7.2
Ch	RSS_TPCC_A_ERRAGG_STATUS		Section 5.2.7.3

0	mem0_done	R/W	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of memory is complete. Write 0x1 to clear status.

5.2.7.41 BSS_RAMPGEN_MEMINIT_STATUS Register (Offset = 430h) [Reset = 0000000h]

BSS_RAMPGEN_MEMINIT_STATUS is shown in [Table 5-799](#).

Return to the [Summary Table](#).

Table 5-799. BSS_RAMPGEN_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	mem0_status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of memory is in progress.

5.2.7.42 BSS_DSS_L3_STICKY Register (Offset = 434h) [Reset = 00000000h]

BSS_DSS_L3_STICKY is shown in [Table 5-800](#).

Return to the [Summary Table](#).

Table 5-800. BSS_DSS_L3_STICKY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-3	RESERVED	R/W	0h	
2-0	sticky_enable	R/W	0h	writing 3'b111 make the BSS_CONTROL::DSS_L3_ACCESS_ENABLE sticky. Further writes to DSS_L3_ACCESS_ENABLE wont impact the register

5.2.7.43 BSS_DSS_L3_ACCESS Register (Offset = 438h) [Reset = 00000000h]

BSS_DSS_L3_ACCESS is shown in [Table 5-801](#).

Return to the [Summary Table](#).

Table 5-801. BSS_DSS_L3_ACCESS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	status	R	0h	reading 1'b0: DSS_L3_BANKD1 is not allocated to BSS_TCMA 1'b1: DSS_L3_BANKD1 is allocated to BSS_TCMA

5.2.7.44 TESTPATTERNRX1ICFG Register (Offset = 800h) [Reset = 00010000h]

TESTPATTERNRX1ICFG is shown in [Table 5-802](#).

Return to the [Summary Table](#).

Table 5-802. TESTPATTERNRX1ICFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX1IINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in I channel Rx channel 0. In this register the naming convention for the 4 Rx channel indices are from 1 to 4 instead of 0 to 3.
15-0	TSTPATRX1IOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in I channel Rx channel 0. In this register the naming convention for the 4 Rx channel indices are from 1 to 4 instead of 0 to 3.

5.2.7.45 TESTPATTERNRX2ICFG Register (Offset = 804h) [Reset = 00010000h]

TESTPATTERNRX2ICFG is shown in [Table 5-803](#).

Return to the [Summary Table](#).

Table 5-803. TESTPATTERNRX2ICFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX2IINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in I channel Rx channel 1.
15-0	TSTPATRX2IOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in I channel Rx channel 1.

5.2.7.46 TESTPATTERNRX3ICFG Register (Offset = 808h) [Reset = 00010000h]

TESTPATTERNRX3ICFG is shown in [Table 5-804](#).

Return to the [Summary Table](#).

Table 5-804. TESTPATTERNRX3ICFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX3IINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in I channel Rx channel 2
15-0	TSTPATRX3IOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in I channel Rx channel 2

5.2.7.47 TESTPATTERNRX4ICFG Register (Offset = 80Ch) [Reset = 00010000h]

TESTPATTERNRX4ICFG is shown in [Table 5-805](#).

Return to the [Summary Table](#).

Table 5-805. TESTPATTERNRX4ICFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX4IINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in I channel Rx channel 3
15-0	TSTPATRX4IOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in I channel Rx channel 3

5.2.7.48 TESTPATTERNRX1QCFG Register (Offset = 810h) [Reset = 00010000h]

TESTPATTERNRX1QCFG is shown in [Table 5-806](#).

Return to the [Summary Table](#).

Table 5-806. TESTPATTERNRX1QCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX1QINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in Q channel Rx channel 0. In this register the naming convention for the 4 Rx channel indices are from 1 to 4 instead of 0 to 3.
15-0	TSTPATRX1QOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in Q channel Rx channel 0. In this register the naming convention for the 4 Rx channel indices are from 1 to 4 instead of 0 to 3.

5.2.7.49 TESTPATTERNRX2QCFG Register (Offset = 814h) [Reset = 00010000h]

TESTPATTERNRX2QCFG is shown in [Table 5-807](#).

Return to the [Summary Table](#).

Table 5-807. TESTPATTERNRX2QCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX2QINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in Q channel Rx channel 1.
15-0	TSTPATRX2QOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in Q channel Rx channel 1.

5.2.7.50 TESTPATTERNRX3QCFG Register (Offset = 818h) [Reset = 00010000h]

TESTPATTERNRX3QCFG is shown in [Table 5-808](#).

Return to the [Summary Table](#).

Table 5-808. TESTPATTERNRX3QCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX3QINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in Q channel Rx channel 2
15-0	TSTPATRX3QOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in Q channel Rx channel 2

5.2.7.51 TESTPATTERNRX4QCFG Register (Offset = 81Ch) [Reset = 00010000h]

TESTPATTERNRX4QCFG is shown in [Table 5-809](#).

Return to the [Summary Table](#).

Table 5-809. TESTPATTERNRX4QCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TSTPATRX4QINCR	R/W	1h	Value to be added for each successive sample for the test pattern data in Q channel Rx channel 3
15-0	TSTPATRX4QOFFSET	R/W	0h	Offset value to be used for the first sample for the test pattern data in Q channel Rx channel 3

5.2.7.52 TESTPATTERNVLDCFG Register (Offset = 820h) [Reset = 0000008h]

TESTPATTERNVLDCFG is shown in [Table 5-810](#).

Return to the [Summary Table](#).

Table 5-810. TESTPATTERNVLDCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R/W	0h	
10-8	TSTPATGENEN	R/W	0h	Enable for test pattern generator. This is used to Mux with the functional data from BSS. 000 -->Disable, 111-->Enable, Others are reserved.
7-0	TSTPATVLDCNT	R/W	8h	Number of DSS Interconnect clocks (200 MHz) between successive samples for the test pattern gen.

5.2.7.53 ADCBUF CFG1 Register (Offset = 824h) [Reset = 00010004h]

ADCBUF CFG1 is shown in [Table 5-811](#).

Return to the [Summary Table](#).

Table 5-811. ADCBUF CFG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	RESERVED	R/W	0h	
16	ADCBUFPIPOSEL	R	1h	TI Internal Feature Ping-pong select value from ADC Buffer Packing logic. Even in SW override mode, this register will indicate the ping-pong select signal generated from the ADC Buffer Packing logic and not the override value.
15	ADCBUFCONTSTOPPL	R/W	0h	Stop Pulse for Continuous mode. The data capture will stop once this register is set. Continuous mode is expected to be only used for CZ and ADC Buffer Testpattern mode : Its a wspecial access type, write to this field will generate a pulse
14	ADCBUFCONTSTRTP	R/W	0h	Start Pulse for Continuous mode. The data capture will start from Address 0 once this register is set. All the other configurations like Enable, Sample Count are expected to be programmed before this pulse. Continuous mode is expected to be only used for CZ and ADC Buffer Testpattern mode : Its a wspecial access type, write to this field will generate a pulse
13	ADCBUFCONTMODEEN	R/W	0h	Continuous mode enable for ADC Buffer. This is set when a fixed number of samples have to be stored in Ping/Pong and not depend on Chirp time-lines (Eg: Analog Lab characterization to stream out continuous data from DFE). Continuous mode is expected to be only used for CZ and ADC Buffer Testpattern mode
12	ADCBUFWRITEMODE	R/W	0h	This needs to be programmed to 0x1 in AR16x 0 --> Interleaved, 1 --> Non-interleaved
11	ADCBUFPIPOOVRVAL	R/W	0h	TI Internal Feature SW override value for ADC Buffer Ping Pong select
10	ADCBUFPIPOOVRCNT	R/W	0h	TI Internal Feature Override control for ADC Buffer Ping Pong select
9	RX3EN	R/W	0h	Enable for Rx3 write
8	RX2EN	R/W	0h	Enable for Rx2 write
7	RX1EN	R/W	0h	Enable for Rx1 write
6	RX0EN	R/W	0h	Enable for Rx0 write
5	ADCBUFIQSWAP	R/W	0h	0 --> I is stored in LSB and Q is stored in MSB 1 --> Q is stored in LSB and I is stored in MSB
4	ADCBUFRL2CHINTRL	R/W	0h	TI reserved field. Do not touch
3	ADCBUFRLMODECHSEL	R/W	0h	TI Internal Feature 0 -->I channel, 1 --> Q channel
2	ADCBUFREALONLYMODE	R/W	1h	0-->Complex Data mode, 1-->Real data mode
1	ADCBUFPIPOSELINV	R/W	0h	TI Internal Feature Inversion control for ADC Buffer Ping-pong select. By default ADC Buffer write starts with Pong write. By setting this bit to 1, it will start from Ping write after reset.
0	ADCBUFWRSOURCE	R/W	0h	TI Internal Feature Write source for ADC Buffer. 0 --> DFE, 1 --> VIN

5.2.7.54 ADCBUFCFG1_EXTD Register (Offset = 828h) [Reset = 0000000h]

ADCBUFCFG1_EXTD is shown in [Table 5-812](#).

Return to the [Summary Table](#).

Table 5-812. ADCBUFCFG1_EXTD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ADCBUFINTGENDLY	R/W	0h	TI Internal Feature. No of clocks to delay the ping-pong switch and interrupt generation w.r.t ADC Valid fall pulse. This will enable dithering the DSP activity for successive ping-pong switch cycles. This will not delay the ping pong toggle which will happen immediately after ADC Valid fall.

5.2.7.55 ADCBUF CFG2 Register (Offset = 82Ch) [Reset = 0100XX00h]

ADCBUF CFG2 is shown in [Table 5-813](#).

Return to the [Summary Table](#).

Table 5-813. ADCBUF CFG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R/W	0h	
26-16	ADCBUFADDRX1	R/W	100h	128 bit Address offset to be added to the internal address pointer for Rx1 writes in Non-interleaved mode.
15-11	RESERVED	R/W	0h	
10-0	ADCBUFADDRX0	R/W	0h	128 bit Address offset to be added to the internal address pointer for Rx0 writes in Non-interleaved mode.

5.2.7.56 ADCBUFCFG3 Register (Offset = 830h) [Reset = 0300XX00h]

ADCBUFCFG3 is shown in [Table 5-814](#).

Return to the [Summary Table](#).

Table 5-814. ADCBUFCFG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-27	RESERVED	R/W	0h	
26-16	ADCBUFADDRX3	R/W	300h	128 bit Address offset to be added to the internal address pointer for Rx3 writes in Non-interleaved mode.
15-11	RESERVED	R/W	0h	
10-0	ADCBUFADDRX2	R/W	200h	128 bit Address offset to be added to the internal address pointer for Rx2 writes in Non-interleaved mode.

5.2.7.57 ADCBUF CFG4 Register (Offset = 834h) [Reset = XX000400h]

ADCBUF CFG4 is shown in [Table 5-815](#).

Return to the [Summary Table](#).

Table 5-815. ADCBUF CFG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	0h	
30	ADCBUF PNGSEL TGLDIS	R/W	0h	TI Internal Feature 0 --> Delay Interrupt Gen and Ping/Pong toggle together based on <code>cfg_interrupt_gen_delay</code> , 1 --> Delay only Interrupt Gen based on <code>cfg_interrupt_gen_delay</code> . But toggle Ping/Pong select signal as soon as the write is complete.
29-26	RESERVED	R/W	0h	
25-21	ADCBUF NUMCHR P PONG	R/W	0h	Number of chirps to be stored in Pong buffer. This register should be programmed with one less than the actual number needed. This is used when data is written to Pong Memory. The value written to this field should be the same as that configured for Ping
20-16	ADCBUF NUMCHR P PING	R/W	0h	Number of chirps to be stored in Ping buffer. This register should be programmed with one less than the actual number needed. This is used when data is written to Pong Memory. The value written to this field should be the same as that configured for Pong
15-0	ADCBUF SAMP CNT	R/W	400h	No of samples to store in each Ping and Pong register in continuous mode of ADC Buffer. In real only mode this refers to the number of real samples and in complex mode, this refers to number of complex samples. This refers to the number of samples per channel. This counter increments once for every new sample from DFE (as long as 1 or more channels are enabled). The max allowed value varies depending on other configurations (No of channels enabled and real/complex data). Continuous mode is expected to be only used for CZ and ADC Buffer Testpattern mode

5.2.7.58 ADCBUFINTGENDITHERDLY Register (Offset = 838h) [Reset = 0000000h]

ADCBUFINTGENDITHERDLY is shown in [Table 5-816](#).

Return to the [Summary Table](#).

Table 5-816. ADCBUFINTGENDITHERDLY Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	ADCBUFINTGENDITHERDLY	R/W	0h	TI Internal Feature. Additional dithering delay added on the Chirp Available interrupt

5.2.7.59 CBUFF_FRAME_START_SEL Register (Offset = 83Ch) [Reset = 0000000h]

CBUFF_FRAME_START_SEL is shown in [Table 5-817](#).

Return to the [Summary Table](#).

Table 5-817. CBUFF_FRAME_START_SEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	0h	
0	sel	R/W	0h	writing: 1'b0: selects frame_start from DFE 1'b1: Selects frame_start from chirp_avail (adc capture complete)

5.2.7.60 CQCFG1 Register (Offset = C00h) [Reset = 4010000Xh]

CQCFG1 is shown in [Table 5-818](#).

Return to the [Summary Table](#).

Table 5-818. CQCFG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	R/W	0h	
30-22	CQ2BASEADDR	R/W	100h	128-bit Address offset which indicates the start address for storing CQ0 (ADC/RxIF Saturation Detection) from the start of CQ memory. This is not the byte address offset but 128 bit address offset
21-13	CQ1BASEADDR	R/W	80h	128-bit Address offset which indicates the start address for storing CQ0 (Signal Image Band Energy detection) from the start of CQ memory. This is not the byte address offset but 128 bit address offset
12-4	CQ0BASEADDR	R/W	0h	128-bit Address offset which indicates the start address for storing CQ0 (Wide Band Energy detection) from the start of CQ memory. This is not the byte address offset but 128 bit address offset
3	CQ96BITPACKEN	R/W	0h	This is used to pack the CQ data into only the LSB 96 bits of each row of the CQ memory. This can be used in 3 channel mode of LVDS where the ADC data and Chirp Params occupy only LSB 96 bits of each memory row.
2	RESERVED	R/W	0h	
1-0	CQDATAWIDTH	R/W	0h	This is used to appropriately pack the valid CQ data bits in appropriate bits in the CQ memory. 00, 01->Raw 16, 10-->Raw 12, 11-->Raw14

5.2.7.61 CQCFG2 Register (Offset = C04h) [Reset = 0000XXXh]

CQCFG2 is shown in [Table 5-819](#).

Return to the [Summary Table](#).

Table 5-819. CQCFG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-18	RESERVED	R/W	0h	
17	CQ_CLK_GATE	R/W	0h	writing: 1'b0: ungates the clk to CQ logic 1'b1: Gates the clk to CQ logic
16	CQPIPOSELVAL	R/W	0h	Ping pong select override value for CQ Memory. 1 --> Read access from Chirp Info Slave of DSS Interconnect will be routed to ping memory and write access from CQ_W/DFE write will be routed to pong memory. 0 --> Read access from Chirp Info Slave of DSS Interconnect will be routed to pong memory and write access from CQ_W/DFE write will be routed to ping memory.
15-13	RESERVED	R/W	0h	
12	CQPIPOSELCNT	R/W	0h	Ping pong select override control for CQ Memory. 0 --> Ping-pong select comes from HW FSM (same as the ping-pong select for ADC Buffer)/DMMCQPINPONSEL 1 --> Ping pong select for CQ memory is taken from SW register (CQPIPOSELVAL)
11-9	RESERVED	R/W	0h	
8	CQ2TESTMODEEN	R/W	0h	TI Internal Feaure Test Mode enable for CQ2 (ADC/RxIF Saturation). Once enabled, each 8 bit data is same as Addr+1.
7-5	RESERVED	R/W	0h	
4	CQ1TESTMODEEN	R/W	0h	TI Internal Feaure Test Mode enable for CQ1 (SI). Once enabled, each 16 bit data is same as [2*Addr+1 for the MSB 8 bits and Addr+1 for the LSB 8 bits.
3-1	RESERVED	R/W	0h	
0	CQ0TESTMODEEN	R/W	0h	TI Internal Feaure Test Mode enable for CQ0 (WBE). Once enabled, each 16 bit data is same as [2*Addr+1 for the MSB 8 bits and Addr+1 for the LSB 8 bits.

5.2.7.62 CPREG0 Register (Offset = C08h) [Reset = 00000000h]

CPREG0 is shown in [Table 5-820](#).

Return to the [Summary Table](#).

Table 5-820. CPREG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CPREG0	R	0h	Chirp Parameters Register 0. Refer to Chirp Parameter section for more details (DSS_CP)

5.2.7.63 CPREG1 Register (Offset = C0Ch) [Reset = 0000001h]

5.2.7.235 fault_attr_status Register (Offset = 102Ch) [Reset = 0000000h]

fault_attr_status is shown in [Table 5-993](#).

Return to the [Summary Table](#).

Fault Attribute Status register

Table 5-993. fault_attr_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	fault_xid	R	0h	XID.
19-8	fault_routeid	R	0h	Route ID.
7-0	fault_privid	R	0h	Privilege ID.

5.2.7.236 fault_clear Register (Offset = 1030h) [Reset = 0000000h]

fault_clear is shown in [Table 5-994](#).

Return to the [Summary Table](#).

Fault Clear register

Table 5-994. fault_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	W	0h	
0	fault_clr	W	0h	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

5.2.8 MSS_IOMUX Registers

Table 5-995 lists the memory-mapped registers for the MSS_IOMUX registers. All register offset addresses not listed in Table 5-995 should be considered as reserved locations and the register contents should not be modified.

Table 5-995. MSS_IOMUX Registers

Offset	Acronym	Register Name	Section
0h	PADAA_cfg_reg		Section 5.2.8.1

Complex bit access types are encoded to fit into small table cells. [Table 5-996](#) shows the codes that are used for access types in this section.

Table 5-996. MSS_IOMUX Access Type Codes

Access Type	Code	Description
Read Type		

**Table 5-996. MSS_IOMUX Access Type Codes
(continued)**

Access Type	Code	Description
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

5.2.8.1 PADAA_cfg_reg Register (Offset = 0h) [Reset = 0000000h]

PADAA_cfg_reg is shown in [Table 5-997](#).

Return to the [Summary Table](#).

Table 5-997. PADAA_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R/W	0h	Reserved
10	sc1	R/W	0h	IO Slew rate control : 0 : higher slew rate. 1: Lower slew rate.
9	pupdsel	R/W	0h	Pullup/PullDown Selection 0 -- Pull Down
8	pi	R/W	0h	Pull Inhibit/Pull Disable 0 -- Enable
7	oe_override	R/W	0h	Active Low Output Override
6	oe_override_ctrl	R/W	0h	Active Low Output Override Control : Write 1 to select Active low Output Override value to control IOs OE_N/GZ instead of the control from hardware
5	ie_override	R/W	0h	Active Low Input Override
4	ie_override_ctrl	R/W	0h	Active Low Input Override Control : Write 1 to select Active low Input Override value to control IOs IE_N/RXACTIVE_N instead of the control from hardware
3-0	func_sel	R/W	0h	Function select

5.2.8.2 PADAB_cfg_reg Register (Offset = 4h) [Reset = 0000000h]

PADAB_cfg_reg is shown in [Table 5-998](#).

Return to the [Summary Table](#).

Table 5-998. PADAB_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R/W	0h	Reserved
10	sc1	R/W	0h	IO Slew rate control : 0 : higher slew rate. 1: Lower slew rate.
9	pupdsel	R/W	0h	Pullup/PullDown Selection 0 -- Pull Down
8	pi	R/W	0h	Pull Inhibit/Pull Disable 0 -- Enable
7	oe_override	R/W	0h	Active Low Output Override
6	oe_override_ctrl	R/W	0h	Active Low Output Override Control : Write 1 to select Active low Output Override value to control IOs OE_N/GZ instead of the control from hardware
5	ie_override	R/W	0h	Active Low Input Override
4	ie_override_ctrl	R/W	0h	Active Low Input Override Control : Write 1 to select Active low Input Override value to control IOs IE_N/RXACTIVE_N instead of the control from hardware
3-0	func_sel	R/W	0h	Function select

5.2.8.3 PADAC_cfg_reg Register (Offset = 8h) [Reset = 0000000h]

PADAC_cfg_reg is shown in [Table 5-999](#).

Return to the [Summary Table](#).

Table 5-999. PADAC_cfg_reg Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	NU	R/W	0h	Reserved
10	sc1	R/W	0h	IO Slew rate control : 0 : higher slew rate. 1: Lower slew rate.

5.2.8.121 USERMODEEN Register (Offset = 1F0h) [Reset = 0000000h]

USERMODEEN is shown in [Table 5-1117](#).

Return to the [Summary Table](#).

Table 5-1117. USERMODEEN Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	USERMODEEN	R/W	0h	Write 0XADADADAD to enable user mode write access to IO CFG space

5.2.8.122 PADGLBLCFGREG Register (Offset = 1F4h) [Reset = 0000000h]

PADGLBLCFGREG is shown in [Table 5-1118](#).

Return to the [Summary Table](#).

Table 5-1118. PADGLBLCFGREG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	PADGLBLCFGREG	R/W	0h	2:0 : global_ie_n_ctl - Write 3'b111 to pass global_ie_n_val to IE_N/ RXACTIVE_N pin of all the IOs. 3 : global_ie_n_val - Active low 10:8 : global_oe_n_ctl - Write 3'b111 to pass global_oe_n_val to OE_N/GZ pin of all the IOs. 11 : global_oe_n_val - Active low 18:16 : global_pi_ctl - Write 3'b111 to pass global_pi_val and global_pu_val to all the IOs 19 : global_pi_val 20 : global_pu_val

5.2.8.123 IOCFGKICK0 Register (Offset = 1F8h) [Reset = 0000000h]

IOCFGKICK0 is shown in [Table 5-1119](#).

Return to the [Summary Table](#).

Table 5-1119. IOCFGKICK0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	IOCFGKICK0	R/W	0h	Kicker 0 Register. The value 83E7 0B13h must be written to KICK0 as part of the process to unlock the CPU write access to the above PIN MUX registers (including IOCFGKICK1)

5.2.8.124 IOCFGKICK1 Register (Offset = 1FCh) [Reset = 00000000h]

IOCFGKICK1 is shown in [Table 5-1120](#).

Return to the [Summary Table](#).

Table 5-1120. IOCFGKICK1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	IOCFGKICK1	R/W	0h	Kicker 1 Register. The value 95A4 F1E0h must be written to the KICK1 as part of the process to unlock the CPU write access to above PINMUX registers (excluding IOCFGKICK0). IOCFGKICK0 has to be written with 83E70B13h to enable access to IOCFGKICK1.

5.2.9 TOP_CTRL Registers

Table 5-1121 lists the memory-mapped registers for the TOP_CTRL registers. All register offset addresses not listed in Table 5-1121 should be considered as reserved locations and the register contents should not be modified.

Table 5-1121. TOP_CTRL Registers

Offset	Acronym	Register Name	Section

Complex bit access types are encoded to fit into small table cells. [Table 5-1122](#) shows the codes that are used for access types in this section.

Table 5-1122. TOP_CTRL Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write

**Table 5-1122. TOP_CTRL Access Type Codes
(continued)**

Access Type	Code	Description
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

5.2.9.1 PID Register (Offset = 0h) [Reset = 61800214h]

PID is shown in [Table 5-1123](#).

Return to the [Summary Table](#).

PID register

Table 5-1123. PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PID_msb16	R	6180h	
15-11	PID_misc	R	0h	
10-8	PID_major	R	2h	
7-6	PID_custom	R	0h	
5-0	PID_minor	R	14h	

5.2.9.2 MDO_CTRL Register (Offset = 4h) [Reset = 000000Xh]

MDO_CTRL is shown in [Table 5-1124](#).

Return to the [Summary Table](#).

Table 5-1124. MDO_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RESERVED	R/W	0h	
5-4	SRC_SELECT	R/W	0h	Select the source IP of LVDS Data 0: Aurora full data on LVDS 1: CBUFF on LVDS 2: Aurora bit-clk ,frame clk and 2 data support. 3: Aurora 1bit clk and 2 data support for LOP package
3-1	RESERVED	R/W	0h	
0	AURORATX_SRC_SELECT	R/W	0h	Select the TPIU source to TOP_AURORATX IP 0:Measurement Data 1: Trace Data

5.2.9.3 PROBE_BUS_SEL0 Register (Offset = 8h) [Reset = 00000000h]

PROBE_BUS_SEL0 is shown in [Table 5-1125](#).

Return to the [Summary Table](#).

Table 5-1125. PROBE_BUS_SEL0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	sel	R/W	0h	Probe Bus 0 Mux Select

5.2.9.4 PROBE_BUS_SEL1 Register (Offset = Ch) [Reset = 0000000h]

PROBE_BUS_SEL1 is shown in [Table 5-1126](#).

Return to the [Summary Table](#).

Table 5-1126. PROBE_BUS_SEL1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	sel	R/W	0h	Probe Bus 1 Mux Select

5.2.9.5 RS232_SLEEP_CLK_DIV Register (Offset = 10h) [Reset = 0000131h]

RS232_SLEEP_CLK_DIV is shown in [Table 5-1127](#).

Return to the [Summary Table](#).

Table 5-1127. RS232_SLEEP_CLK_DIV Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	div_val	R/W	131h	The Divider value for RS232 sleep clock generation from RCclk

5.2.9.6 RS232_SLEEP_CLK_DIV_by2 Register (Offset = 14h) [Reset = 00000098h]

RS232_SLEEP_CLK_DIV_by2 is shown in [Table 5-1128](#).

Return to the [Summary Table](#).

Table 5-1128. RS232_SLEEP_CLK_DIV_by2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	div_val	R/W	98h	The Dividerby2 value for RS232 sleep clock generation from RCclk. This decides the duty cycle of sleep clock.

5.2.9.7 RS232_STATUS Register (Offset = 18h) [Reset = 02B6X000h]

RS232_STATUS is shown in [Table 5-1129](#).

Return to the [Summary Table](#).

Table 5-1129. RS232_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	RESERVED	R	0h	
27-16	curr_bit_interval	R	2B6h	Current RS232 bit interval being used
15-12	RESERVED	R	0h	
11-0	clk_duration	R	0h	Number of vbusp clocks measured in one sleep clock frequency

5.2.9.8 EFUSE_DIEID0 Register (Offset = 200h) [Reset = 00000000h]

EFUSE_DIEID0 is shown in [Table 5-1130](#).

Return to the [Summary Table](#).

Table 5-1130. EFUSE_DIEID0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	val	R	0h	EFUSE DieID[31:0]

5.2.9.9 EFUSE_DIEID1 Register (Offset = 204h) [Reset = 00000000h]

EFUSE_DIEID1 is shown in [Table 5-1131](#).

Return to the [Summary Table](#).

Table 5-1131. EFUSE_DIEID1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	val	R	0h	EFUSE DieID[63:32]

5.2.9.10 EFUSE_DIEID2 Register (Offset = 208h) [Reset = 00000000h]

EFUSE_DIEID2 is shown in [Table 5-1132](#).

Return to the [Summary Table](#).

Table 5-1132. EFUSE_DIEID2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	val	R	0h	EFUSE DieID[95:64]

5.2.9.11 EFUSE_DIEID3 Register (Offset = 20Ch) [Reset = 0000000h]

EFUSE_DIEID3 is shown in [Table 5-1133](#).

Return to the [Summary Table](#).

Table 5-1133. EFUSE_DIEID3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	val	R	0h	EFUSE DieID[127:96]

5.2.9.12 EFUSE_UID0 Register (Offset = 210h) [Reset = 0000000h]

EFUSE_UID0 is shown in [Table 5-1134](#).

Return to the [Summary Table](#).

Table 5-1134. EFUSE_UID0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	val	R	0h	EFUSE UID[31:0]

5.2.9.13 EFUSE_UID1 Register (Offset = 214h) [Reset = 0000000h]

EFUSE_UID1 is shown in [Table 5-1135](#).

Return to the [Summary Table](#).

Table 5-1135. EFUSE_UID1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	val	R	0h	EFUSE UID[63:32]

5.2.9.14 EFUSE_UID2 Register (Offset = 218h) [Reset = 0000000h]

EFUSE_UID2 is shown in [Table 5-1136](#).

Return to the [Summary Table](#).

Table 5-1136. EFUSE_UID2 Register Field Descriptions

Bit	Field	Type	Reset	Description

Complex bit access types are encoded to fit into small table cells. [Table 5-1233](#) shows the codes that are used for access types in this section.

Table 5-1233. RSS_PROC_CTRL Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Reset or Default Value		
-n		Value after reset or the default value

5.2.10.1 PID Register (Offset = 0h) [Reset = 61800214h]

PID is shown in [Table 5-1234](#).

Return to the [Summary Table](#).

PID register

Table 5-1234. PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	PID_msb16	R	6180h	
15-11	PID_misc	R	0h	
10-8	PID_major	R	2h	
7-6	PID_custom	R	0h	
5-0	PID_minor	R	14h	

5.2.10.2 HW_REG0 Register (Offset = 4h) [Reset = 0000000h]

HW_REG0 is shown in [Table 5-1235](#).

Return to the [Summary Table](#).

Table 5-1235. HW_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	reg	R/W	0h	TI Reserved

5.2.10.3 RSS_CR4_MBOX_WRITE_DONE Register (Offset = 8h) [Reset = 0XXXXXXh]

RSS_CR4_MBOX_WRITE_DONE is shown in [Table 5-1236](#).

Return to the [Summary Table](#).

Table 5-1236. RSS_CR4_MBOX_WRITE_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	RESERVED	R/W	0h	
28	proc_7	R/W	0h	This register should be written once finishing writing into the mailbox memory of processor 7
27-25	RESERVED	R/W	0h	
24	proc_6	R/W	0h	This register should be written once finishing writing into the mailbox memory of processor 6
23-21	RESERVED	R/W	0h	
20	proc_5	R/W	0h	This register should be written once finishing writing into the mailbox memory of processor 5
19-17	RESERVED	R/W	0h	
16	proc_4	R/W	0h	This register should be written once finishing writing into the mailbox memory of processor 4
15-13	RESERVED	R/W	0h	
12	proc_3	R/W	0h	This register should be written once finishing writing into the mailbox memory of processor 3
11-9	RESERVED	R/W	0h	
8	proc_2	R/W	0h	This register should be written once finishing writing into the mailbox memory of processor 2
7-5	RESERVED	R/W	0h	
4	proc_1	R/W	0h	This register should be written once finishing writing into the mailbox memory of processor 1
3-1	RESERVED	R/W	0h	
0	proc_0	R/W	0h	This register should be written once finishing writing into the mailbox memory of processor 0

5.2.10.4 RSS_CR4_MBOX_READ_REQ Register (Offset = Ch) [Reset = 0XXXXXXh]

RSS_CR4_MBOX_READ_REQ is shown in [Table 5-1237](#).

Return to the [Summary Table](#).

Table 5-1237. RSS_CR4_MBOX_READ_REQ Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	RESERVED	R/W	0h	
28	proc_7	R/W	0h	This is request from processor 7 to mss_cr5a. Requesting it to read from mailbox.
27-25	RESERVED	R/W	0h	
24	proc_6	R/W	0h	This is request from processor 6 to mss_cr5a. Requesting it to read from mailbox.
23-21	RESERVED	R/W	0h	
20	proc_5	R/W	0h	This is request from processor 5 to mss_cr5a. Requesting it to read from mailbox.
19-17	RESERVED	R/W	0h	
16	proc_4	R/W	0h	This is request from processor 4 to mss_cr5a. Requesting it to read from mailbox.
15-13	RESERVED	R/W	0h	
12	proc_3	R/W	0h	This is request from processor 3 to mss_cr5a. Requesting it to read from mailbox.
11-9	RESERVED	R/W	0h	
8	proc_2	R/W	0h	This is request from processor 2 to mss_cr5a. Requesting it to read from mailbox.
7-5	RESERVED	R/W	0h	
4	proc_1	R/W	0h	This is request from processor 1 to mss_cr5a. Requesting it to read from mailbox.
3-1	RESERVED	R/W	0h	
0	proc_0	R/W	0h	This is request from processor 0 to mss_cr5a. Requesting it to read from mailbox.

5.2.10.5 RSS_CR4_MBOX_READ_DONE Register (Offset = 10h) [Reset = 0XXXXXXh]

RSS_CR4_MBOX_READ_DONE is shown in [Table 5-1238](#).

Return to the [Summary Table](#).

Table 5-1238. RSS_CR4_MBOX_READ_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	RESERVED	R/W	0h	
28	proc_7	R/W	0h	This register should be written once finishing reading from CR5A's mailbox written by proc 7
27-25	RESERVED	R/W	0h	
24	proc_6	R/W	0h	This register should be written once finishing reading from CR5A's mailbox written by proc 6
23-21	RESERVED	R/W	0h	
20	proc_5	R/W	0h	This register should be written once finishing reading from CR5A's mailbox written by proc 5
19-17	RESERVED	R/W	0h	
16	proc_4	R/W	0h	This register should be written once finishing reading from CR5A's mailbox written by proc 4
15-13	RESERVED	R/W	0h	
12	proc_3	R/W	0h	This register should be written once finishing reading from CR5A's mailbox written by proc 3
11-9	RESERVED	R/W	0h	
8	proc_2	R/W	0h	This register should be written once finishing reading from CR5A's mailbox written by proc 2
7-5	RESERVED	R/W	0h	
4	proc_1	R/W	0h	This register should be written once finishing reading from CR5A's mailbox written by proc 1
3-1	RESERVED	R/W	0h	
0	proc_0	R/W	0h	This register should be written once finishing reading from CR5A's mailbox written by proc 0

5.2.10.6 RSS_CR4_MBOX_READ_DONE_ACK Register (Offset = 14h) [Reset = 0000000h]

RSS_CR4_MBOX_READ_DONE_ACK is shown in [Table 5-1239](#).

Return to the [Summary Table](#).

Table 5-1239. RSS_CR4_MBOX_READ_DONE_ACK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	proc	R/W	0h	Write pulse bit field: For bits 0 to 7: Writing 1'b1 : Generates pulse interrupt to corresponding proc from RSS_CR4

5.2.10.7 BSS_TO_SOC_SW_INT Register (Offset = 18h) [Reset = 0000000h]

BSS_TO_SOC_SW_INT is shown in [Table 5-1240](#).

Return to the [Summary Table](#).

Table 5-1240. BSS_TO_SOC_SW_INT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R/W	0h	
3-0	trig	R/W	0h	Write pulse bit field: For bits 0 to 3: Wrting 1'b1 : Generates DSS_SW_INT_RSS_PROC_CTRL<0-3>

5.2.10.8 RSS_TO_MSS_INT_MASK Register (Offset = 1Ch) [Reset = 0000001Xh]

RSS_TO_MSS_INT_MASK is shown in [Table 5-1241](#).

Return to the [Summary Table](#).

Table 5-1241. RSS_TO_MSS_INT_MASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31-5	RESERVED	R/W	0h	
4	ESM_LO	R/W	1h	writing: 1'b1: Mask ESM-LO interrupt reaching DSS and MSS 1'b0: Unmaks ESM-LO interrupt reaching DSS and MSS
3-1	RESERVED	R/W	0h	
0	ESM_HI	R/W	1h	writing: 1'b1: Mask ESM-HI interrupt reaching DSS and MSS 1'b0: Unmaks ESM-HI interrupt reaching DSS and MSS

5.2.10.9 RSS_CR4_BOOT_INFO_REG0 Register (Offset = 20h) [Reset = 0000000h]

RSS_CR4_BOOT_INFO_REG0 is shown in [Table 5-1242](#).

Return to the [Summary Table](#).

Table 5-1242. RSS_CR4_BOOT_INFO_REG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	config	R/W	0h	Reserved Register for Software use

5.2.10.10 RSS_CR4_BOOT_INFO_REG1 Register (Offset = 24h) [Reset = 0000000h]

RSS_CR4_BOOT_INFO_REG1 is shown in [Table 5-1243](#).

Return to the [Summary Table](#).

Table 5-1243. RSS_CR4_BOOT_INFO_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	config	R/W	0h	Reserved Register for Software use

5.2.10.11 RSS_CR4_BOOT_INFO_REG2 Register (Offset = 28h) [Reset = 0000000h]

RSS_CR4_BOOT_INFO_REG2 is shown in [Table 5-1244](#).

Return to the [Summary Table](#).

Table 5-1244. RSS_CR4_BOOT_INFO_REG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	config	R/W	0h	Reserved Register for Software use

5.2.10.12 RSS_CR4_BOOT_INFO_REG3 Register (Offset = 2Ch) [Reset = 0000000h]

RSS_CR4_BOOT_INFO_REG3 is shown in [Table 5-1245](#).

Return to the [Summary Table](#).

Bit	Field	Type	Reset	Description
31-0	config	R/W	0h	Reserved Register for Software use

5.2.10.15 RSS_CR4_BOOT_INFO_REG6 Register (Offset = 38h) [Reset = 0000000h]

RSS_CR4_BOOT_INFO_REG6 is shown in [Table 5-1248](#).

Return to the [Summary Table](#).

Table 5-1248. RSS_CR4_BOOT_INFO_REG6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	config	R/W	0h	Reserved Register for Software use

5.2.10.16 RSS_CR4_BOOT_INFO_REG7 Register (Offset = 3Ch) [Reset = 0000000h]

RSS_CR4_BOOT_INFO_REG7 is shown in [Table 5-1249](#).

Return to the [Summary Table](#).

Table 5-1249. RSS_CR4_BOOT_INFO_REG7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	config	R/W	0h	Reserved Register for Software use

5.2.10.17 RSS_STATIC_MEM_MEMINIT Register (Offset = 40h) [Reset = 0000000h]

RSS_STATIC_MEM_MEMINIT is shown in [Table 5-1250](#).

Return to the [Summary Table](#).

Table 5-1250. RSS_STATIC_MEM_MEMINIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	0h	
0	start	R/W	0h	Start Memory initialization of memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed.

5.2.10.18 RSS_STATIC_MEM_MEMINIT_DONE Register (Offset = 44h) [Reset = 0000000h]

RSS_STATIC_MEM_MEMINIT_DONE is shown in [Table 5-1251](#).

Return to the [Summary Table](#).

Table 5-1251. RSS_STATIC_MEM_MEMINIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	0h	
0	done	R/W	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of memory is complete. Write 0x1 to clear status.

5.2.10.19 RSS_STATIC_MEM_MEMINIT_STATUS Register (Offset = 48h) [Reset = 0000000h]

RSS_STATIC_MEM_MEMINIT_STATUS is shown in [Table 5-1252](#).

Return to the [Summary Table](#).

Table 5-1252. RSS_STATIC_MEM_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of memory is in progress.

5.2.10.20 RSS_MBOX_MEMINIT Register (Offset = 4Ch) [Reset = 00000000h]

RSS_MBOX_MEMINIT is shown in [Table 5-1253](#).

Return to the [Summary Table](#).

Table 5-1253. RSS_MBOX_MEMINIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	0h	
0	start	R/W	0h	Start Memory initialization of memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed.

5.2.10.21 RSS_MBOX_MEMINIT_DONE Register (Offset = 50h) [Reset = 0000000h]

RSS_MBOX_MEMINIT_DONE is shown in [Table 5-1254](#).

Return to the [Summary Table](#).

Table 5-1254. RSS_MBOX_MEMINIT_DONE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R/W	0h	
0	done	R/W	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of memory is complete. Write 0x1 to clear status.

5.2.10.22 RSS_MBOX_MEMINIT_STATUS Register (Offset = 54h) [Reset = 0000000h]

RSS_MBOX_MEMINIT_STATUS is shown in [Table 5-1255](#).

Return to the [Summary Table](#).

Table 5-1255. RSS_MBOX_MEMINIT_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	0h	
0	status	R	0h	Status field. Read value 0x1 indicates previously triggered Memory initialization of memory is in progress.

5.2.10.23 FRCCFG Register (Offset = 400h) [Reset = 0007FX0Xh]

FRCCFG is shown in [Table 5-1256](#).

Return to the [Summary Table](#).

Table 5-1256. FRCCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-29	RESERVED	R/W	0h	
28-26	FRCSYNCINSRCSEL	R/W	0h	FRC Sync In Source Select. 0-->SW Sync In, 1-->External Sync In
25	FRCCFGSWRST	R/W	0h	FRC Software reset. Self clearing Pulse.
24	FRCCMPDIS	R/W	0h	FRC Parity Compare Disable
23	FRCCMPXORININV	R/W	0h	FRC Parity Compare Logic input XOR Inversion.
22	FRCCMPXOROUTINV	R/W	0h	FRC Parity Compare Logic output XOR Inversion.
21	FRCCMPOROUTMSK	R/W	0h	Parity Compare Logic OR Out Mask
20	FRCCMPANDOUTMSK	R/W	0h	Parity Compare Logic AND Out Mask
19	FRCSSYNCIN	R/W	0h	FRC Software Sync In signal.
18-17	MSSEVNTGEN1UMOD	R/W	3h	MSS Event Gen 1 Usage Mode. 00-->Only LSB, 01-->LSB+MID, 10,11-->All 3 Part.
16-15	MSSEVNTGEN2UMOD	R/W	3h	MSS Event Gen 2 Usage Mode. 00-->Only LSB, 01-->LSB+MID, 10,11-->All 3 Part.
14-13	MSSEVNTGEN3UMOD	R/W	3h	MSS Event Gen 3 Usage Mode. 00-->Only LSB, 01-->LSB+MID, 10,11-->All 3 Part.
12-11	MSSEVNTGEN4UMOD	R/W	3h	MSS Event Gen 4 Usage Mode. 00-->Only LSB, 01-->LSB+MID, 10,11-->All 3 Part.
10	MSSSWTRIG1	R/W	0h	MSS Software Trigger 1. Self clearing Pulse
9	MSSSWTRIG2	R/W	0h	MSS Software Trigger 2. Self clearing Pulse
8	RESERVED	R/W	0h	
7	FRCEN	R/W	0h	Enable for FRC
6	FRCADCCLKENGATE	R/W	0h	Gating signal for ADC clock enable pulse sent to analog. 0 --> Allow the signal to pass through. 1--> Gate off FRC Sync Out signal.
5	FRCSYNCSINGATE	R/W	0h	Gating signal for ext_sync_in signal. 0 --> Allow the signal to pass through. 1--> Gate off FRC Sync Out signal.
4	FRCSYNCSOUTGATE	R/W	0h	Gating signal for ext_sync_out pulse. 0 --> Allow the signal to pass through. 1--> Gate off FRC Sync Out signal.
3	FRCSYNCSOUTMODE	R/W	0h	0 Uses only LSB counter for frame pulse generation. 1 Uses both LSB and MID counters for frame pulse generation.
2-1	FRCADCCLKENSEL	R/W	0h	ADC Clock Enable Select. 00,11-->Ext Sync In, 01-->LSB Roll-over, 10-->MID Counter Rollover
0	RESERVED	R/W	0h	

5.2.10.24 MSSEVNTGEN1LSB Register (Offset = 404h) [Reset = 0FFFFFFFh]

5.2.10.48 FRCLSBCNT Register (Offset = 464h) [Reset = 0FFFFFFFh]

FRCLSBCNT is shown in [Table 5-1281](#).

Return to the [Summary Table](#).

Table 5-1281. FRCLSBCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	FRCLSBCNT	R	0FFFFFFFh	LSB Count Value of FRC

5.2.10.49 FRCMIDCNT Register (Offset = 468h) [Reset = 00000000h]

FRCMIDCNT is shown in [Table 5-1282](#).

Return to the [Summary Table](#).

Table 5-1282. FRCMIDCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	FRCMIDCNT	R	0h	MID Count Value of FRC

5.2.10.50 FRCMSBCNT Register (Offset = 46Ch) [Reset = 00000000h]

FRCMSBCNT is shown in [Table 5-1283](#).

Return to the [Summary Table](#).

Table 5-1283. FRCMSBCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	FRCMSBCNT	R	0h	MSB Count Value of FRC

5.2.10.51 TIMSTMPTRIGSEL Register (Offset = 470h) [Reset = 00X0X0X0h]

TIMSTMPTRIGSEL is shown in [Table 5-1284](#).

Return to the [Summary Table](#).

Table 5-1284. TIMSTMPTRIGSEL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	RESERVED	R/W	0h	
27-24	TIMSTMPTRIG1SEL	R/W	0h	Trigger select for Time Stamp 1. 0-->MSS Sw Trig1, 1-->MSS SW Trig2, 2-->GPIO1, 3-->GPIO2, 4-->GPIO3, 5-->MSS MSG1, 6-->MSS MSG2, 7-->MSS MSG3, 8-->Ext Sync In, 9-->MSS MSG4, 10-->MSS MSG5
23-20	RESERVED	R/W	0h	
19-16	TIMSTMPTRIG2SEL	R/W	0h	Trigger select for Time Stamp 2. 0-->MSS Sw Trig1, 1-->MSS SW Trig2, 2-->GPIO1, 3-->GPIO2, 4-->GPIO3, 5-->MSS MSG1, 6-->MSS MSG2, 7-->MSS MSG3, 8-->Ext Sync In, 9-->MSS MSG4, 10-->MSS MSG5
15-12	RESERVED	R/W	0h	
11-8	TIMSTMPTRIG3SEL	R/W	0h	Trigger select for Time Stamp 3. 0-->MSS Sw Trig1, 1-->MSS SW Trig2, 2-->GPIO1, 3-->GPIO2, 4-->GPIO3, 5-->MSS MSG1, 6-->MSS MSG2, 7-->MSS MSG3, 8-->Ext Sync In, 9-->MSS MSG4, 10-->MSS MSG5
7-4	RESERVED	R/W	0h	
3-0	TIMSTMPTRIG4SEL	R/W	0h	Trigger select for Time Stamp 4. 0-->MSS Sw Trig1, 1-->MSS SW Trig2, 2-->GPIO1, 3-->GPIO2, 4-->GPIO3, 5-->MSS MSG1, 6-->MSS MSG2, 7-->MSS MSG3, 8-->Ext Sync In, 9-->MSS MSG4, 10-->MSS MSG5

5.2.10.52 FRCLSBPERIOD Register (Offset = 474h) [Reset = 0000000h]

FRCLSBPERIOD is shown in [Table 5-1285](#).

Return to the [Summary Table](#).

Table 5-1285. FRCLSBPERIOD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	RESERVED	R/W	0h	
27-0	FRCLSBPERIOD	R/W	0h	LSB Period for FRC. This is copied into the shadow registers inside the module at the roll over condition and hence any update to these registers during the frame will take effect for the next frame.

5.2.10.53 FRCMIDPERIOD Register (Offset = 478h) [Reset = 0000000h]

FRCMIDPERIOD is shown in [Table 5-1286](#).

Return to the [Summary Table](#).

Table 5-1286. FRCMIDPERIOD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	FRCMIDPERIOD	R/W	0h	MID Period for FRC. This is copied into the shadow registers inside the module at the roll over condition and hence any update to these registers during the frame will take effect for the next frame.

5.2.10.54 FRCLSBCNTINITVAL Register (Offset = 47Ch) [Reset = 0FFFFFFFh]

FRCLSBCNTINITVAL is shown in [Table 5-1287](#).

Return to the [Summary Table](#).

Table 5-1287. FRCLSBCNTINITVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	RESERVED	R/W	0h	
27-0	FRCLSBCNTINITVAL	R/W	0FFFFFFFh	Init Value for FRC LSB Counter

5.2.10.55 FRCMIDCNTINITVAL Register (Offset = 480h) [Reset = 0000000h]

FRCMIDCNTINITVAL is shown in [Table 5-1288](#).

Return to the [Summary Table](#).

Table 5-1288. FRCMIDCNTINITVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	FRCMIDCNTINITVAL	R/W	0h	Init Value for FRC MID Counter

5.2.10.56 FRCMSBCNTINITVAL Register (Offset = 484h) [Reset = 0000000h]

FRCMSBCNTINITVAL is shown in [Table 5-1289](#).

Return to the [Summary Table](#).

Table 5-1289. FRCMSBCNTINITVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	RESERVED	R/W	0h	
27-0	FRCMSBCNTINITVAL	R/W	0h	Init Value for FRC MSB Counter

5.2.10.57 FRCSYNCOUPLSBCNT Register (Offset = 488h) [Reset = 0000000h]

FRCSYNCOUPLSBCNT is shown in [Table 5-1290](#).

Return to the [Summary Table](#).

Table 5-1290. FRCSYNCOUPLSBCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	RESERVED	R/W	0h	
27-0	FRCSYNCOUPLSBCNT	R/W	0h	LSB Count value used for generating Frame Pulse (ext_sync_out)

5.2.10.58 FRCSYNCOUTMIDCNT Register (Offset = 48Ch) [Reset = 0000000h]

FRCSYNCOUTMIDCNT is shown in [Table 5-1291](#).

Return to the [Summary Table](#).

Table 5-1291. FRCSYNCOUTMIDCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-12	RESERVED	R/W	0h	
11-0	FRCSYNCOUTMIDCNT	R/W	0h	MID Count value used for generating Frame Pulse (ext_sync_out)

5.2.10.59 FRCRESETMODE Register (Offset = 490h) [Reset = 0000000h]

FRCRESETMODE is shown in [Table 5-1292](#).

Return to the [Summary Table](#).

Table 5-1292. FRCRESETMODE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	0h	
1	FRCMIDRESETMODE	R/W	0h	Reset mode for MID Counter. 0-->Sync_In, 1-->LSB Period
0	FRCLSBRESETMODE	R/W	0h	Reset mode for LSB Counter. 0-->Sync_In, 1-->LSB Period

5.2.10.60 FRCCFG2 Register (Offset = 494h) [Reset = 00XX0010h]

FRCCFG2 is shown in [Table 5-1293](#).

Return to the [Summary Table](#).

Table 5-1293. FRCCFG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	RESERVED	R/W	0h

31-8	RESERVED	R/W	0h	
7-0	eoi_vector	R/W	0h	EOI vector value. Write this with interrupt distribution value in the chip.

5.2.10.78 fault_address Register (Offset = 1024h) [Reset = 00000000h]

fault_address is shown in [Table 5-1311](#).

Return to the [Summary Table](#).

Fault Address register

Table 5-1311. fault_address Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	fault_addr	R	0h	Fault Address.

5.2.10.79 fault_type_status Register (Offset = 1028h) [Reset = 00000000h]

fault_type_status is shown in [Table 5-1312](#).

Return to the [Summary Table](#).

Fault Type Status register

Table 5-1312. fault_type_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R	0h	
6	fault_ns	R	0h	Non-secure access.
5-0	fault_type	R	0h	Fault Type 10_0000 = Supervisor read fault - priv = 1 dir = 1 dtype ! = 1 01_0000 = Supervisor write fault - priv = 1 dir = 0 00_1000 = Supervisor execute fault - priv = 1 dir = 1 dtype = 1 00_0100 = User read fault - priv = 0 dir = 1 dtype = 1 00_0010 = User write fault - priv = 0 dir = 0 00_0001 = User execute fault - priv = 0 dir = 1 dtype = 1 00_0000 = No fault

5.2.10.80 fault_attr_status Register (Offset = 102Ch) [Reset = 0000000h]

fault_attr_status is shown in [Table 5-1313](#).

Return to the [Summary Table](#).

Fault Attribute Status register

Table 5-1313. fault_attr_status Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	fault_xid	R	0h	XID.
19-8	fault_routeid	R	0h	Route ID.
7-0	fault_privid	R	0h	Privilege ID.

5.2.10.81 fault_clear Register (Offset = 1030h) [Reset = 0000000h]

fault_clear is shown in [Table 5-1314](#).

Return to the [Summary Table](#).

Fault Clear register

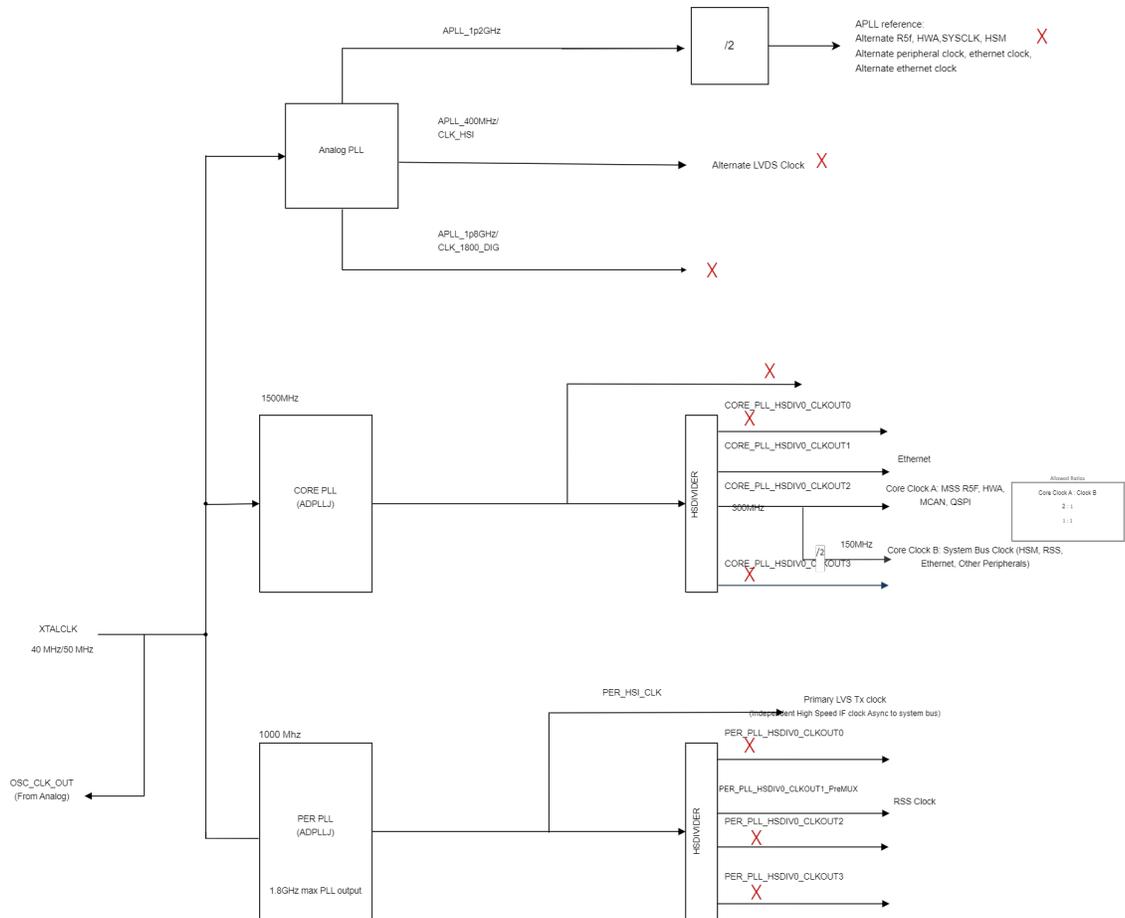

Table 5-1314. fault_clear Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	W	0h	
0	fault_clr	W	0h	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

5.3 Device Clock Architecture

5.3.1 Clock Overview

[Figure 5-2](#) shows a high-level overview of the device clock architecture. The figure captures the key clock sources and the configuration options available to select the appropriate clock source. The detailed structure is captured under each PLL clocking section.

X These paths are not to be used in typical configuration.

Figure 5-2. Clock Tree Configuration

5.3.2 External Clocks

The clocks in the AWR2544 device to the supported peripherals are as depicted in Figure 5-3.

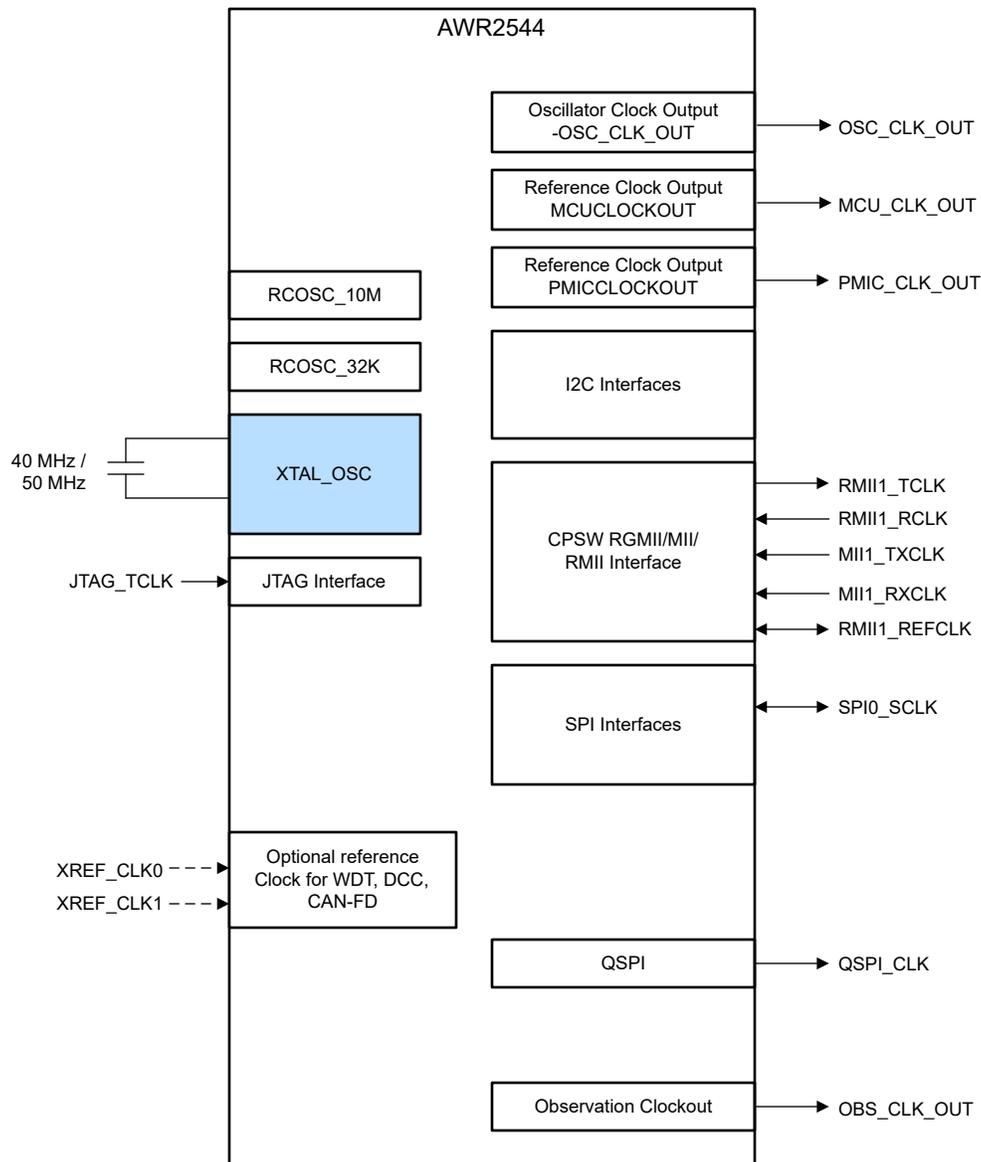

Figure 5-3. External Clocks

Note

RCOSC_10M , RCOSC_32K : these two clocks are internal and not available for application.

5.3.3 Clock Selection

Table 5-1315 lists the configuration options for the clock source, divider, and gating selections for different peripheral clocks.

Table 5-1315. Configuration Options

5.3.4 Analog Modules

5.3.4.1 ADPLL

General features of the ADPLL-J module are:

- Low Jitter Phase-Locked Loop
- RHEA, OCP, and Direct Access interface
- Programmable 8-bit input divider: N

- Programmable 12-bit integer, 18-bit fractional loop multiplier: M
- Programmable 7-bit post divider: M2
- Digital control and loop filter
- User-selectable multiple in-built oscillators for power-jitter optimization
- Primary output clock on digital core domain: $CLKOUT = (M / (N+1)) * CLKINP * (1/M2)$
- Additional output clock on internal LDO domain: $CLKOUTLDO = (M / (N+1)) * CLKINP * (1/M2)$
- Internal oscillator clock on internal LDO domain: $CLKDCOLDO = (M / (N+1)) * CLKINP$
- Output clock gating control: CLKOUTEN / CLKOUTLDOEN / CLKOUTDCOLDOEN
- Digital LOCK indicators for frequency and phase lock
- Fast re-lock
- Input to output bypass on CLKOUT
- Bypass programmable 4-bit divider: N2: $CLKOUT = CLKINP / (N2 + 1)$
- Optional low frequency bypass clock control: ULOWCLKEN CLKOUT = CLKINPULOW
- Power management modes:
 - Power down
 - Idle bypass
 - Stop Clock-input Bypass
 - Retention
- Output clock Spread spectrum clocking supported

The ADPLLLJ is a low jitter PLL with a 2-GHz maximum output. ADPLLLJ has a predivide feature which allows user to divide, for instance, a 24-MHz or 26-MHz reference clock to 1 MHz and then multiply up to 2 GHz maximum. All PLLs will come-up in bypass mode at reset. SW needs to program all the PLL settings appropriately and then wait for PLL to be locked.

Spread Spectrum Clocking

The module supports spread spectrum clocking (SSC) on its output clocks. SSC is used to spread the spectral peaking of the clock to reduce any electromagnetic interference (EMI) that may be caused due to the clock's fundamental or any of its harmonics. When SSC is enabled the clock's spectrum is spread by the amount of frequency spread, and the attenuation is given by the ratio of the frequency spread (Δf) and the modulation frequency (fm), i.e., $10 * \log_{10}(\Delta f/fm)$ dB.

Note

Please refer [MMWAVE-MCUPLUS-SDK](#) for reference implementation of this feature.

5.3.4.2 ADPLLJ Programming Model

5.3.4.2.1 ADPLLJ Programming Sequence

The following sequence is for PLL_PER. Similar registers exist for PLL_CORE and PLL_DSP.

1. Program the values M and N2 in TOP_RCM: PLL_PER_MN2DIV.
2. Program the values of N and M2 in TOP_RCM:PLL_PER_M2NDIV.
3. Program the Fractional M in TOP_RCM:PLL_PER_FRACDIV_FRACTIONALM.
4. Program the Sigma Delta Divider (SD) in TOP_RCM:PLL_PER_FRACDIV_REGSD.
5. Copy the NWEELL TRIM from EFUSE to TOP_RCM:PLL_PER_CLKCTRL_NWEELLTRIM.
6. Write 0x0 to TOP_RCM:PLL_PER_CLKCTRL_IDLE.
7. Write 0x1 to TOP_RCM:PLL_PER_TENABLE.
8. Write 0x1 to TOP_RCM:PLL_PER_CLKCTRL_TINTZ.
9. Write 0x0 to TOP_RCM:PLL_PER_TENABLE.
10. Write 0x1 to TOP_RCM: PLL_PER_TENABLEDIV.
11. Write 0x0 to TOP_RCM: PLL_PER_TENABLEDIV.
12. Poll Lock Status by reading TOP_RCM:PLL_PER_STATUS_PHASELOCK until it is 0x1.

5.3.4.2.2 HS Divider Programming Sequence

1. Program the CLKOUT0 Divider value in TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT0_DIV.
2. Program the CLKOUT0 Divider value in TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT1_DIV.
3. Program the CLKOUT0 Divider value in TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT2_DIV.
4. Program the CLKOUT0 Divider value in TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT3_DIV.
5. Write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_TENABLEDIV.
6. Write 0x0 to TOP_RCM:PLL_PER_HSDIVIDER_TENABLEDIV.
7. Enable the CLKOUT0 by write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT0_GATE_CTRL.
8. Enable the CLKOUT0 by write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT1_GATE_CTRL.
9. Enable the CLKOUT0 by write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT2_GATE_CTRL.
10. Enable the CLKOUT0 by write 0x1 to TOP_RCM:PLL_PER_HSDIVIDER_CLKOUT3_GATE_CTRL.

5.3.4.2.3 M2 and N2 Change On-the-Fly

The dividers M2 and N2 are designed to change on the fly and provide a glitch-free frequency switch from the old to new frequencies. In other words, they can be changed while the PLL is in a locked condition, without having to switch to bypass mode. A status toggle bit will give an indication if the new divisor was accepted. These dividers can also be changed in bypass mode, and the new divisor value will be reflected on output after the PLL relocks. For more details, see the PLL configuration procedures for each PLL.

5.4 Memory Protection Unit (MPU) and Firewalls

5.4.1 Functional Operation

The MPU performs memory protection checking for a CBA bus. It inputs a VBUSM or VBUSP bus, then checks the address against the fixed and programmable regions to see if the access is allowed. If allowed, the transfer is passed unmodified to the output VBUSM or VBUSP bus. If the transfer is illegal (fails the protection check), then the MPU does not pass the transfer to the output bus but rather services the transfer internally back to the input bus (to prevent a hang) returning the fault status to the requestor as well as generating an interrupt about the fault.

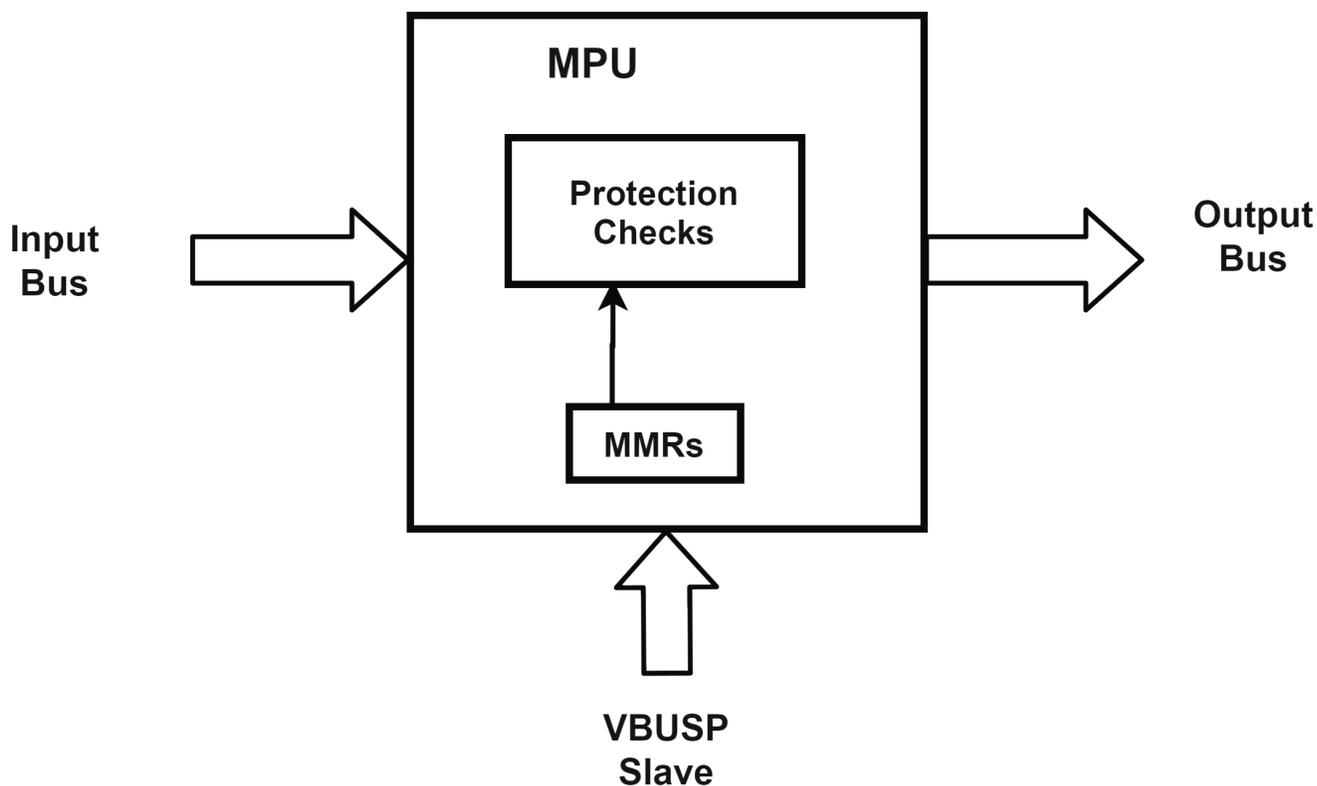

Figure 5-4. MPU Top Level Diagram

The first check is the transfer's privID against the AID settings. There is an AID register bit for each possible privID (0 to 15) and an AIDX that covers privIDs not configured. The privID is used to lookup the associated AID bit. If the AID bit is 0, then the range does not cover that privilege level and the range is not checked (although other ranges with different AID setting will) for this transfer. If the AID bit is 1, then the range does cover that privilege level and the permissions are checked. The transfer secure and debug parameters are checked against the MPPA values to detect an allowed access. The two bits (NS and EMU) provide 3 permission levels. If the NS is set, the range is non-secure and any security or debug level may access the range. If the NS is not set, the range is secure only and only secure level accesses are allowed. In secure mode, if the EMU is set, debug accesses are allowed. If the EMU is not set, debug accesses are not allowed. For non-debug accesses, the read, write, and execute permissions are also checked. There is a set of permissions for supervisor mode and another for user mode. The "priv" attribute of the transfer determines which is checked. If priv = 1, the supervisor rwx bits are checked against the "dir" and "dtype" attributes of the transfer (read is dir = 1 and dtype not instruction, write is dir = 0, execute is dir = 1 and dtype = instruction). If priv = 0, the user rwx bits are checked against the same attributes. If the associated rwx bit for the type of transfer is 1, the transfer is allowed, but if the rwx bit is 0, the transfer is not allowed.

The function outputs whether the transfer is allowed or not. If the transfer address range (start to end address, or those with AID bits = 0) does not match any range, the transfer is either allowed or disallowed based on the configuration mode of the MPU to "assumed allowed" or "assumed disallowed" mode. If any of the overlapped ranges does not allow the access, the access is not allowed. Only when all the overlapped ranges allow the access is the access allowed. The final permissions are the lowest of each type of permission from any hit range (so if a transfer hits 2 ranges, one that is rw and one that is rx, then the final permission is just r).

5.4.2 Firewalls

There are 2 types of firewalls in the system: access control firewalls and PrivID-based firewalls. The following sections clarify the usage of the firewalls.

Access control firewalls — These firewalls generally allow or disallow access to a particular entity. The different variations of these firewalls are:

- Configuration-based complete (read-write) access allow/disallow
- Configuration-based selected (read/write/read-write) access allow/disallow

The firewalls also support a "Lock" of the configuration, which is a sticky bit implementation that does not allow for any further updates to the configuration until the next power cycle.

PrivID based firewalls — The PrivID-based firewall is used to protect peripheral ports from unintentional access from controller ports. The transactions over the bus interconnect have an associated Privilege Identifier field with the read-write access used to determine the validity (allow-disallow) of the transaction. A high level view of the firewall is shown in [Figure 5-5](#).

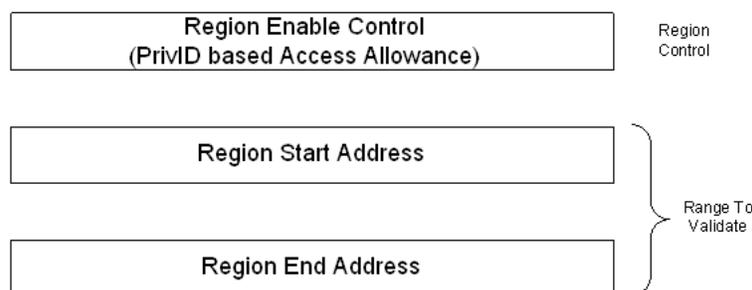

Figure 5-5. PrivID Firewall Overview

A region and the region controls are defined as to which controllers/PrivIDs would be allowed or disallowed access (based on modes). If the address range (start address to end address) of the input transfer overlaps with one of the regions, then the transfer parameters are checked against the address range permissions. These permissions are programmable and follow the MPPA (Memory Protection Permission Attribute) standard

set by the Highlander Memory Management architecture. Additionally, the region controls also include read/write/execute permissions both in user/supervisor modes. Further, secure and debug modes can also be configured.

Thus, this section of the PCR controls the configurations of MPU regions in the device. The default_prog_mppa, default_prog_start_addr, default_prog_end_addr (for region 0 and 1) at the time of reset. It is controlled based on security manager's signals soc_firewall_bypass and hsm_firewall_bypass.

		mppa0	start_addr0	end_addr0	mppa1	start_addr1	end_addr1
		[31:0]	[31:0]	[31:0]	[31:0]	[31:0]	[31:0]
MPU_MSS_L2_BANK_A	Firewall Bypass	0x03FFFFFF	0x00000000	0xFFFFFFFF	0x00000000	0x00000000	0x00000000

Figure 5-6. Default MPU Reset Configurations

5.4.3 ID Allocation

The PrivID allocation is primarily a static allocation in the system, and defined by the values specified in .

Table 5-1316. PrivID Grouping and Allocation

Master Group	PrivID Allocation
MSS Masters	
MSS Cortex R5FA,B AXI-M (x2)	0x2
MSS eDMA TPTCs	0x2
Ethernet DMA	0x2
Debug Masters	
DebugSS JTAG	0x4
RS232	0x4
DSS Masters	
DSS MDMA Port	0x5
DSS eDMA TPTC	0x5
DSS CM4 Master	0x5
DSS eDMA TPTC	0x5
RCSS Masters	
RCSS ICSS-M Ports (x2)	0x6
RCSS eDMA TPTCs (x2)	0x6

5.4.4 Memory Map (MPU)

The default registers are listed in [Table 5-1317](#). There can also be configured MMRs.

Table 5-1317. Memory Map Registers

Address Offset	Register
0x000	Revision
0x004	Configuration
0x010	Interrupt Raw Status/Set
0x014	Interrupt Enabled Status/Clear
0x018	Interrupt Enable
0x01C	Interrupt Enable Clear
0x020 - 0x0FC	Reserved

Table 5-1317. Memory Map Registers (continued)

Address Offset	Register
0x100	Reserved
0x104	Reserved
0x108	Reserved
0x10C	Reserved
0x110 - 0x1FC	Reserved
0x200	Programmable 1 Start Address
0x204	Programmable 1 End Address
0x208	Programmable 1 MPPA
0x20C	Reserved
0x210 - 0x2FC	Additional Programmable Range MMRs
0x300	Fault 1 Address
0x304	Fault 1 Status
0x308	Fault 1 Clear

5.4.4.1 Revision Register (Base Address + 0x000)

The Revision Register contains the ID and revision information.

Table 5-1318. Revision Register

Bits	Field	Type	Reset	Description
31:30	scheme	r/o	1	Scheme.
29:28	reserved	r/o	0	Always read as 0. Writes have no affect.
27:16	modID	r/o	0xe81	Module ID field.
15:11	revrtl	r/o	Any	RTL revision. Will vary depending on release.
10:8	revmaj	r/o	1	Major revision.
7:6	revcustom	r/o	0	Custom revision.
5:0	revmin	r/o	2	Minor revision.

5.4.4.2 Configuration Register (Base Address + 0x004)

The readonly Configuration register contains the configured values of the module.

Table 5-1319. Configuration Register

Bits	Field	Type	Reset	Description
31:24	address_align	r/o	0	Address alignment for range checking. 0 = 1k 1 = 2k 2 = 4k ...
23:20	num_fixed	r/o	0	Number of fixed address ranges.
19:16	num_prog	r/o	8	Number of programmable address ranges.
15:12	num_fixed_aids	r/o	0	Number of supported fixed AIDs. 0 = no specific fixed AIDs supported (all treated equally) N = PrivIDs from 0 to N-1 supported, others use AIDX
11:1	reserved	r/o	0	Always read as 0.

Table 5-1319. Configuration Register (continued)

Bits	Field	Type	Reset	Description
0	assumed_allowed	r/o	0	Assumed allowed mode. 0 = assumed disallowed 1 = assumed allowed

5.4.4.3 Interrupt Raw Status/Set Register (Base Address + 0x010)

The Interrupt Raw Status/Set register shows the interrupt status (before enabling) and allows setting of the interrupt status.

Table 5-1320. Interrupt Raw Status/Set Register

Bits	Field	Type	Reset	Description
31:02:00	reserved	r/o	0	Always read as 0.
1	addr_err	w1ts	0	Addressing violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.
0	prot_err	w1ts	0	Protection violation error. Raw status is read. Write a 1 to set the status. Writing a 0 has no effect.

5.4.4.4 Interrupt Enabled Status/Clear Register (Base Address + 0x014)

The Interrupt Enabled Status/Clear register shows the interrupt enabled status and allows clearing of the interrupt status.

Table 5-1321. Interrupt Enabled Status/Clear Register

Bits	Field	Type	Reset	Description
31:2	reserved	r/o	0	Always read as 0.
1	enabled_addr_err	w1tc	0	Addressing violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.
0	enabled_prot_err	w1tc	0	Protection violation error. Enabled status is read. Write a 1 to clear the status. Writing a 0 has no effect.

5.4.4.5 Interrupt Enable Register (Base Address + 0x018)

The Interrupt Enable register shows the interrupt enable value and allows setting the enable.

Table 5-1322. Interrupt Enable Register

Bits	Field	Type	Reset	Description
31:02	reserved	r/o	0	Always read as 0.
1	addr_err_en	w1ts	0	Addressing violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.
0	prot_err_en	w1ts	0	Protection violation error enable. Write a 1 to set the enable. Writing a 0 has no effect.

5.4.4.6 Interrupt Enable Clear Register (Base Address + 0x01C)

The Interrupt Enable Clear register shows the interrupt enable and allows clearing of the interrupt enable. Reads return the Interrupt Enable register value, but writes can clear the interrupt enables.

Table 5-1323. Interrupt Enable Clear Register

Bits	Field	Type	Reset	Description
31:02	reserved	r/o	0	Always read as 0.

Table 5-1323. Interrupt Enable Clear Register (continued)

Bits	Field	Type	Reset	Description
1	addr_err_en_clr	w1tc	0	Addressing violation error enable. Write a 1 to clear the enable. Writing a 0 has no effect.
0	prot_err_en_clr	w1tc	0	Protection violation error enable. Write a 1 to clear the enable. Writing a 0 has no effect.

5.4.4.7 EOI Register (Base Address + 0x020)

The EOI register allows software to indicate when the end of interrupt service is complete. The eoi vector value is dependent on the interrupt handling.

Table 5-1324. EOI Register

Bits	Field	Type	Reset	Description
31:8	reserved	r/o	0	Always read as 0.
7:0	eoi_vector	r/w	0	EOI vector value. Write this with the interrupt distribution value in the chip. This drives the mpu_eoi_vector output signal.

5.4.4.8 Interrupt Vector Register (Base Address + 0x024)

The Interrupt Vector register displays the interrupt vector returned from interrupt distribution.

Table 5-1325. Interrupt Vector Register

Bits	Field	Type	Reset	Description
31:0	intr_vec	r/o	0	Interrupt vector. Reads mpu_intr_vector input signal.

5.4.4.9 Programmable Address Start Register N (Base Address + 0x200, 0x210, 0x220, ...)

The Programmable Address Start register holds the start address for the range. This register is writeable by a supervisor entity (priv = 1) only. If the NS bit is in non-secure mode (= 0) in the associated MPPA register, the register is also only writeable by a secure entity (secure = 1). The width of the field is determined by the comp_width parameter.

(Note: For GP device 'Bypass' is the default reset value and for HS-SE device 'Block' is the default reset value. For MPU_RSS_DSS2RSS and MPU_RSS_MSS2RSS the default reset value is 'Bypass' for all type of devices)

Refer to Default MPU Reset Configurations.

Table 5-1326. Programmable Address Start Register

Bits	Field	Type	Reset	Description
31:N	start_addrN	r/w	input	Start address for range N. Defaults to input signal value.
N-1:0	reserved	r/o	0	Always read as 0.

5.4.4.10 Programmable Address End Register N (Base Address + 0x204, 0x214, 0x224, ...)

The Programmable Address End register holds the end address for the range. This register is writeable by a supervisor entity (priv = 1) only. If the NS bit is in non-secure mode (= 0) in the associated MPPA register, the register is also only writeable by a secure entity (secure = 1). The field width is determined by the comp_width parameter.

(Note: For GP device 'Bypass' is the default reset value and for HS-SE device 'Block' is the default reset value. For MPU_RSS_DSS2RSS and MPU_RSS_MSS2RSS the default reset value is 'Bypass' for all type of devices)

Refer to Default MPU Reset Configurations.

Table 5-1327. Programmable Address End Register

Bits	Field	Type	Reset	Description
31:N	end_addrN	r/w	input	End address for range N. Defaults to input signal value.
N-1:0	reserved	r/o	1s	Always read as all bits 1.

5.4.4.11 Programmable MPPA Register N (Base Address + 0x208, 0x218, 0x228, ...)

The Programmable Address MPPA register holds the permissions for the region. This register is writeable by a non-debug supervisor entity (priv = 1) only. If the NS bit is in secure mode (= 0), the register is also only writeable by a non-debug secure entity (secure = 1). The NS bit is only writeable by a non-debug secure entity. For debug accesses, the register is writeable only when NS = 1 or EMU = 1.

(Note: For GP device 'Bypass' is the default reset value and for HS-SE device 'Block' is the default reset value. For MPU_RSS_DSS2RSS and MPU_RSS_MSS2RSS the default reset value is 'Bypass' for all type of devices)

Refer to Default MPU Reset Configurations.

Table 5-1328. Programmable MPPA Register

Bits	Field	Type	Reset	Description
31:26	reserved	r/o	0	Always read as 0.
25:10	AID15-0	r/w	input	AIDs checked for this region. Defaults to input value. 0 = AID is not checked for these permissions. 1 = AID is checked for these permissions.
9	AIDX	r/w	input	Additional AIDs checked. Defaults to input value.
8	reserved	r/o	0	Always read as 0.
7	ns	r/w	input	Non-secure permission. Defaults to input value.
6	emu	r/w	input	Debug permission. Defaults to input value.
5	sr	r/w	input	Supervisor read permission. Defaults to input value.
4	sw	r/w	input	Supervisor write permission. Defaults to input value.
3	sx	r/w	input	Supervisor executable permission. Defaults to input value.
2	ur	r/w	input	User read permission. Defaults to input value.
1	uw	r/w	input	User write permission. Defaults to input value.
0	ux	r/w	input	User executable permission. Defaults to input value.

5.4.4.12 Fault Address Register (Base Address + 0x300)

The Fault Address register holds the address of the first protection fault transfer.

Table 5-1329. Fault Address Register

Bits	Field	Type	Reset	Description
31:0	fault_addr	r/o	0	Fault address.

5.4.4.13 Fault Status Register (Base Address + 0x304)

The Fault Status register holds the status and attributes of the first protection fault transfer.

Table 5-1330. Fault Status Register

Bits	Field	Type	Reset	Description
31:24	id	r/o	0	Transfer ID.
23:16	mstid	r/o	0	controller ID.
15:13	reserved	r/o	0	Always read as 0.
12:09	privid	r/o	0	Privilege ID.
8	reserved	r/o	0	Always read as 0.
7	ns	r/o	0	Non-secure access.
6	reserved	r/o	0	Always read as 0.
5:00	fault_type	r/o	0	Fault type. 100000 = supervisor read fault 010000 = supervisor write fault 001000 = supervisor execute fault 000100 = user read fault 000010 = user write fault 000001 = user execute fault 111111 = relaxed cache linefill fault 010010 = relaxed cache writeback fault 000000 = no fault

5.4.4.14 Fault Clear Register (Base Address + 0x308)

The Fault Clear register allows the software to clear the current fault, so that another can be captured when this register is written.

Table 5-1331. Fault Clear Register

Bits	Field	Type	Reset	Description
31:1	reserved	r/o	0	Always read as 0.
0	fault_clr	w/o	0	Fault clear. Writing a 1 clears the current fault. Writing a 0 has no effect.

5.5 Power Domains

The DSS_L3 memory, MSS_L2 memory and the HWA can be switched off dynamically if required.

5.5.1 DSP Subsystem L3 Power Domain

The DSS L3 memory can be controlled from DSS_RCM registers by the software.

By default, all the L3 memory is Power ON.

When partially switching off banks, it is the software's responsibility to ensure that the banks are disabled from the last 256 KB bank, that is, DSS L3 BANK B1. A bank should not be powered off if all its higher banks are not powered off. For example, if DSS L3 BANK A1 is powered down, BANK B0 and B1 are also powered down.

5.5.1.1 L3 Memory Bank Power Sequence

Below is the sequence to Power off a bank:

1. Write 0x7 to DSS_RCM:DSS_L3_BANK*_PD_CTRL_ISO field.
2. Write 0x0 to DSS_RCM:DSS_L3_BANK*_PD_CTRL_AONIN field.
3. Wait until DSS_RCM:DSS_L3_BANK*_PD_STATUS_AONOUT field is 0x0.
4. Write 0x0 to DSS_RCM:DSS_L3_BANK*_PD_CTRL_AGOODIN field.
5. Wait until DSS_RCM:DSS_L3_BANK*_PD_STATUS_AGOODOUT field is 0x0.

Below is the sequence to Power on a bank:

1. Write 0x7 to DSS_RCM:DSS_L3_BANK*_PD_CTRL_AONIN field.
2. Wait until DSS_RCM:DSS_L3_BANK*_PD_STATUS_AONOUT field is 0x1.
3. Write 0x7 to DSS_RCM:DSS_L3_BANK*_PD_CTRL_AGOODIN field.
4. Wait until DSS_RCM:DSS_L3_BANK*_PD_STATUS_AGOODOUT field is 0x1.
5. Write 0x0 to DSS_RCM:DSS_L3_BANK*_PD_CTRL_ISO field.

Table 5-1332. DSS L3 Bank Control

Bank 256 KB	Bank Name	Control Registers
0	DSS L3 BANK A0	DSS_L3_BANKA0_PD_CTRL_AGOODIN DSS_L3_BANKA0_PD_CTRL_AONIN DSS_L3_BANKA0_PD_CTRL_ISO
1	DSS L3 BANK A1	DSS_L3_BANKA1_PD_CTRL_AGOODIN DSS_L3_BANKA1_PD_CTRL_AONIN DSS_L3_BANKA1_PD_CTRL_ISO
4	DSS L3 BANK B0	DSS_L3_BANKA2_PD_CTRL_AGOODIN DSS_L3_BANKA2_PD_CTRL_AONIN DSS_L3_BANKA2_PD_CTRL_ISO
5	DSS L3 BANK B1	DSS_L3_BANKB0_PD_CTRL_AGOODIN DSS_L3_BANKB0_PD_CTRL_AONIN DSS_L3_BANKB0_PD_CTRL_ISO

Sticky Bit Implementation

The L3 banks power control can be locked from further updates by writing 0x7 to the register DSS_RCM:DSS_L3_PD_CTRL_STCIKYBIT:SET field. Any update to the DSS_L3_BANK*_PD_CTRL, AONIN and AGOODIN fields do not have an impact on HW. The sticky bit is reset with Warm Reset.

The actual HW control to the memory can be read by reading the fields DSS_L3_BANK*_PD_STATUS_AONIN and DSS_L3_BANK*_PD_STATUS_AGOODIN

5.5.2 MSS L2 Power Domain

The MSS L2 memory can be controlled from the MSS_RCM registers by the software. By default, all the MSS_L2 memory is Power ON.

5.5.2.1 Power Sequence

Below is the sequence to Power off a bank:

1. Write 0x7 to MSS_RCM:MSS_L2_BANK*_PD_CTRL_ISO field.
2. Write 0x0 to MSS_RCM:MSS_L2_BANK*_PD_CTRL_AONIN field.
3. Wait until MSS_RCM:MSS_L2_BANK*_PD_STATUS_AONOUT field is 0x0.
4. Write 0x0 to MSS_RCM:MSS_L2_BANK*_PD_CTRL_AGOODIN field.
5. Wait until MSS_RCM:MSS_L2_BANK*_PD_STATUS_AGOODOUT field is 0x0.

Below is the sequence to Power on a bank:

1. Write 0x7 to MSS_RCM:MSS_L2_BANK*_PD_CTRL_AONIN field.
2. Wait until MSS_RCM:MSS_L2_BANK*_PD_STATUS_AONOUT field is 0x1.
3. Write 0x7 to MSS_RCM:MSS_L2_BANK*_PD_CTRL_AGOODIN field.
4. Wait until MSS_RCM:MSS_L2_BANK*_PD_STATUS_AGOODOUT field is 0x1.
5. Write 0x0 to MSS_RCM:MSS_L2_BANK*_PD_CTRL_ISO field.

When a block is powered off, a bus error is generated on access. It is always safe to have decent delay between each step because memory might take some time before reaching to total power-on state.

Table 5-1333. Registers Controls For Each Memory Block

Bank 512KB	Bank Name	Control Registers
0	MSS L2 BANK A	MSS_L2_BANKA_PD_CTRL_AGOODIN MSS_L2_BANKA_PD_CTRL_AONIN MSS_L2_BANKA_PD_CTRL_ISO
1	MSS L2 BANK B	MSS_L2_BANKB_PD_CTRL_AGOODIN MSS_L2_BANKB_PD_CTRL_AONIN MSS_L2_BANKB_PD_CTRL_ISO

HWA Power Domain

The HWA can be controlled from DSS_RCM registers by SW. By Default, all the HWA is Power ON.

Power Sequence

Below is the sequence to Power off the HWA

1. Write 0x7 to DSS_RCM:DSS_HWA_PD_CTRL:ISO field
2. Write 0x0 to DSS_RCM:DSS_HWA_PD_CTRL:AONIN field
3. Wait till DSS_RCM:DSS_HWA_PD_STATUS:AONOUT field is 0x0
4. Write 0x0 to DSS_RCM:DSS_HWA_PD_CTRL:AGOODIN field
5. Wait till DSS_RCM:DSS_HWA_PD_STATUS:AGOODOUT field is 0x0

Below is the sequence to Power on the HWA

1. Write 0x7 to DSS_RCM:DSS_HWA_PD_CTRL:AONIN field
2. Wait till DSS_RCM:DSS_HWA_PD_STATUS:AONOUT field is 0x1
3. Write 0x7 to DSS_RCM:DSS_HWA_PD_CTRL:AGOODIN field
4. Wait till DSS_RCM:DSS_HWA_PD_STATUS:AGOODOUT field is 0x1
5. Write 0x0 to DSS_RCM:DSS_HWA_PD_CTRL:ISO field

It is always safe to have decent delay between each step because HWA might take some time before reaching to total power on state. So even though AONOUT is 1'b1 does not mean HWA is ON.

Registers

Below is the corresponding register controls for each block of memory

Bank 512KB	Bank Name	Control Register
0	HWA (Hard Macro)	DSS_RCM:DSS_HWA_PD_CTRL:AGOODIN DSS_RCM:DSS_HWA_PD_CTRL:AONIN DSS_RCM:DSS_HWA_PD_CTRL:ISO DSS_RCM:DSS_HWA_PD_STATUS

5.6 Resets

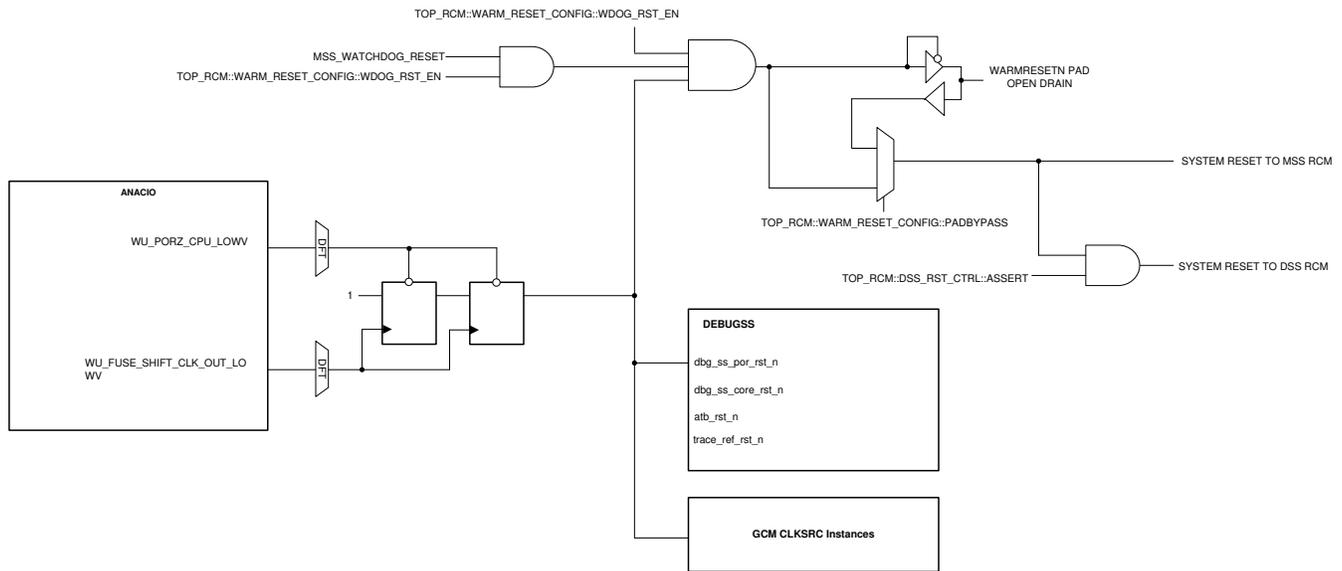

Figure 5-7. Resets

Two device resets are available that can be controlled from the device pins: the power-on reset pin NRESET and the bidirectional WARM_RESET signal. The warm reset signal is implemented as an I/O, so that an external monitor can be used to detect changes to the state of the internal warm reset control signal.

Reset Types and Sources

Table 5-1334. Reset Types and Sources

Reset Type	Reset Source	Description
Power On Reset	Device Pin NRESET	Reset triggered by the device reset pin NREST. This resets the entire device, including all subsystems and interfaces. This is an active low asynchronous Power ON reset signal, and must be asserted for minimum 20 usec to reset the device.

Table 5-1334. Reset Types and Sources (continued)

Reset Type	Reset Source	Description
Warm Reset	Software Reset (Register write), Watch Dog Reset, Device Pin WARM_RESET pin	<p>This is an active low warm reset internally generated by the device, or triggered by device pin WARM_RESET.</p> <p>A write to the TOP_RCM.WARM_RESET_CONFIG[10:8] register or watch dog module can generate this reset; additionally, the external pin WARM_RESET can also be used to trigger this reset. Selection is controlled through the TOP_RCM.WARM_RESET_CONFIG register.</p> <p>The WARM_RESET pin is an open-drain failsafe IO which can be used to reset the device from the external world or to report the reset to the external world if it is generated by an internal source such as watchdog.</p> <p>A write to the TOP_RCM.WARM_RESET_CONFIG, as explained in register description, can create this reset. The watch dog module in the main subsystem can be configured to trigger this reset. Check the watch dog module description for details. This feature is enabled by the TOP_RCM.WARM_RESET_CONFIG register.</p>

As listed in above table, various reset sources can generate the different resets used inside the device to reset various components and submodules. A Warm_reset excludes certain modules and spaces listed in this table from reset. These can only be reset by power-on reset.

Reset Domains

The device can be divided into various reset domains. The top reset domains cover the entire device and all of the subsystems. Additional subsystem-level reset domains are available, and can be reset independently based on resets mentioned in below table.

Table 5-1335. Reset Domains

Reset Domains	Description	Resets
Top reset domain	This top device-level reset domain resets entire device and all subsystems. All other reset domains are subdomains of this domain, and resetting this domain issues a reset to these subdomains. Only power-on reset can reset this domain, and it is immune to any other system reset type. Sub reset domain can be independently reset, as mentioned in the respective rows.	Power-on reset
Main subsystem reset domain	This reset subdomain controls the reset to the main subsystem and the modules inside it. Resetting the top reset domain also resets this domain.	Power-on reset Warm reset

Table 5-1335. Reset Domains (continued)

Reset Domains	Description	Resets
Radar subsystem reset domain	This reset subdomain controls the reset to the radar subsystem and all components inside it. Resetting the top reset domain also resets this domain.	Power-on reset Warm reset
DSP subsystem reset domain	This reset subdomain controls the reset to the DSP subsystem and all components inside it. Resetting the top reset domain also resets this domain.	Power-on reset Warm reset

5.7 Temperature Sensor

The AWR2544 device has multiple on-chip temperature sensors (TS) which are distributed in and around different components of silicon. The RF front-end of the device contains multiple TS, which RadarSS can access to measure the temperature for RX and TX components. The application can read these TS through RadarSS using the mmWaveLink API (AWR_RF_TEMPERATURE_GET_SB, rIRfGetTemperatureReport). There are three digital temperature sensors available on the die nearby specific components [TS0: C66x, TS1: HWA, TS2: R5F] which the application can access via [GPADC](#). There are two digital temperature sensors available on the die nearby specific components [TS1: HWA, TS2: R5F] which the application can access via [GPADC](#).

Note

Refer to the GPADC driver and unit-test application from [MMWAVE-MCUPLUS-SDK](#) for reference code to read these temperature sensors.

This page intentionally left blank.

Device includes the following processor core and accelerators:

- MCU Subsystem ARM Cortex lockstep R5F
- Radar Processing Hardware Accelerators
- Radar Subsystem ARM Corex lockstep R4F

6.1 Main Subsystem Cortex R5F

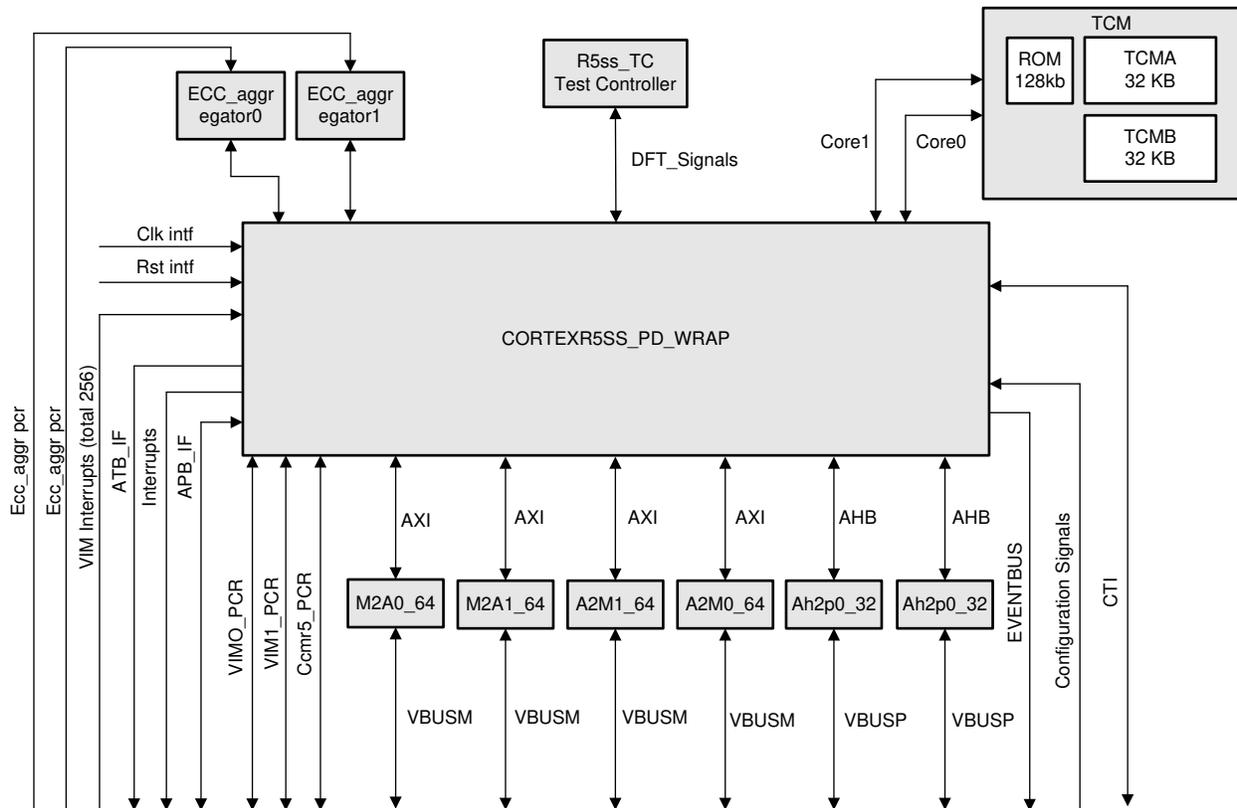

Figure 6-1. Main Subsystem

The Main SubSystem is a dual-core implementation of the Arm Cortex-R5F processor configured for split/lock operation. It also includes accompanying memories (L1 caches and tightly-coupled memories), standard Arm® CoreSight™ debug and trace architecture, integrated Vectored Interrupt Manager (VIM), ECC Aggregators, and various other modules for protocol conversion and address translation for easy integration into the SoC.

6.1.1 Main ARM SubSystem Features

The MSS supports the following features:

- ARMv7-R architecture with the following extensions:

- Basic SIMD extension for integer and floating-point vector operations
- Vector Floating Point Version 3 (VFPv3) with Single/Double Precision
- Dynamic branch prediction with a global history buffer, and a 4-entry return stack
- Only Lock step mode is supported.
- L1 memory architecture (per each CPU in split mode, or single lock-step CPU):
 - 16KByte I-Cache with 64-bit ECC
 - 16Kbyte D-cache with 32-bit ECC
 - 128KB TCM with 32-bit ECC
 - in lock-step mode
 - for each core in split-mode
- L2 Interface
 - 64-bit Controller interface for peripheral access
 - 64-bit Target interface for cache and TCM access
 - 32-bit Controller interface for MCU peripherals
 - ECC on data. Redundancy on Control bus
- Vectored Interrupt Manager with ECC protection on Vector Table RAM
 - VIM1 and VIM2 in lockstep pair when CPU cores are in lock step mode
- Static (boot time) configuration for lockstep mode.
- CPU Self-Test Controller for CPU core, VIM, and Comparator modules
- PBIST controller for test of all the RAMs
- Support to test ECC functionality in safety-critical applications
- Built in debug features
 - Up to 8 hardware breakpoints per CPU
 - Up to 8 watch points per CPU
- 32-bit Target Debug interface to access Debug components (CTI, ETM, ATB)
- Trace interface to a Core Sight ETM-R5
- Performance Monitoring Unit (PMU)
- Little Endian mode of operation

6.1.2 TCM Initialization

Auto-init module has been implemented for initializing the TCMs. Paths from TCMA and TCMB are timing-critical, so the initialization of these memories occur through the test path. Initialization of TCMA and TCMB occurs in parallel.

Below are the registers used for the TCM initialization

- Writing 1 to MSS_CTRL:MSS_<A/B>TCM_MEM_INIT:MSS_<A/B>TCM_MEM_INIT_MEM_INIT starts the mem-init for MSS_TCM<A/B>_CR5A.
- Reading 1 from MSS_CTRL: MSS_<A/B>TCM_MEM_INIT_DONE: MSS_<A/B>TCM_MEM_INIT_DONE_MEM_INIT_DONE confirms the end of initialization for MSS_TCM<A/B>_CR5A.
- Writing 1 to MSS_CTRL: MSS_<A/B>TCM_MEM_INIT_DONE: MSS_<A/B>TCM_MEM_INIT_DONE_MEM_INIT_DONE clears the field.
- Reading 1 from MSS_CTRL: MSS_<A/B>TCM_MEM_INIT_STATUS: MSS_<A/B>TCM_MEM_INIT_STATUS_MEM_STATUS confirms progress of initialization for MSS_TCM<A/B>_CR5A.

6.1.3 Resets

AWR2544 supports the following resets:

- CR5SS_POR_RST: This is the full MCU R5F subsystem reset. It is also the Power On Reset.
- CR5ASS_RST: This reset is only for the Cortex R5F and the Vectored Interrupt Manager of the CoreA. None of the other logics are reset.
- CR5A_RST: This only reset the cortex of the R5F of the CoreA.
-

-
- VIMA_RST: This only reset the vectored interrupt manager of the CoreA.
-

6.1.3.1 R5F Subsystem Reset Trigger

For the safe reset of the R5F subsystem, follow this reset sequence:

1. Write 3'b111 to MSS_CTRL: R5_CONTROL: R5_CONTROL_RESET_FSM_TRIGGER starts the sequencer.
2. The sequencer is waiting for WFI from only CR5A if WFI_CHECKEN for corresponding resets is programmed. The sequencer isolates CR5SS when it receives WFI from CR5A.
3. The sequencer triggers CR5SS_POR_RST, which triggers resets to all resets mentioned in resets-table.
4. The intent is to reset CR5SS when it is in isolation. Thus, before Step 1, ensure MSS_RCM:RST2ASSERTDLY is programmed to 0;.
5. Reset is asserted for RST_ASSERTDLY: RST_ASSERTDLY_COMMON number of clock cycles, and released.

6.1.4 MSS_CCMR Registers

[Table 6-1](#) lists the memory-mapped registers for the MSS_CCMR registers. All register offset addresses not listed in [Table 6-1](#) should be considered as reserved locations and the register contents should not be modified.

Table 6-1. MSS_CCMR Registers

Offset	Acronym	Register Name	Section
0h	CCMSR1	CCMSR1	Go
4h	CCMKEYR1	CCMKEYR1	Go
8h	CCMSR2	CCMSR2	Go
Ch	CCMKEYR2	CCMKEYR2	Go
10h	CCMSR3	CCMSR3	Go
14h	CCMKEYR3	CCMKEYR3	Go
18h	CCMPOLCNTRL	CCMPOLCNTRL	Go

Complex bit access types are encoded to fit into small table cells. [Table 6-2](#) shows the codes that are used for access types in this section.

Table 6-2. MSS_CCMR Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

6.1.4.1 CCMSR1 Register (Offset = 0h) [Reset = 0000000h]

CCMSR1 is shown in [Table 6-3](#).

Return to the [Summary Table](#).

CPU Compare Status Register

Table 6-3. CCMSR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	NU2	R/W	0h	Reserved
16	CMPE1	R/W	0h	Compare Error 0 = CPU signals are identical 1 = CPU signal compare mismatch Writes '1' to clear this bit
15-9	NU1	R/W	0h	Reserved
8	STC1	R/W	0h	Self Test Complete 0 = self test on-going if self test mode asserted 1 = self test is complete Writes have no effect
7-2	NU0	R/W	0h	Reserved
1	STET1	R/W	0h	Self Test Error Type 0 = self test failed during Compare Match test 1 = self test failed during Compare mismatch test Writes have no effect
0	STE1	R	0h	Self Test Error 0 = self test passed 1 = self test failed Writes have no effect

6.1.4.2 CCMKEYR1 Register (Offset = 4h) [Reset = 0000000h]

CCMKEYR1 is shown in [Table 6-4](#).

Return to the [Summary Table](#).

CPU Compare Key Register

Table 6-4. CCMKEYR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	NU3	R/W	0h	Reserved
3-0	MKEY1	R/W	0h	Mode Key 0000 = lock step mode 0110 = self test mode 1001 = error forcing mode 1111 = self test error forcing mode

6.1.4.3 CCMSR2 Register (Offset = 8h) [Reset = 0000000h]

CCMSR2 is shown in [Table 6-5](#).

Return to the [Summary Table](#).

VIM Compare Status Register

Table 6-5. CCMSR2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-17	NU6	R/W	0h	Reserved
16	CMPE2	R/W	0h	Compare Error 0 = VIM signals are identical 1 = VIM signal compare mismatch Writes '1' to clear this bit
15-9	NU5	R/W	0h	Reserved
8	STC2	R/W	0h	Self Test Complete 0 = self test on-going if self test mode asserted 1 = self test is complete Writes have no effect
7-2	NU4	R/W	0h	Reserved

6.2 Radar Processing Hardware Accelerator

The AWR2544 device incorporates Radar Hardware Accelerators HWA1.5 to offload the CPU from pre-processing computations.

6.2.1 Radar Accelerator Features Overview

- Flexible enough to offload almost all the operations from the initial compensation (DC estimation-correction, interference mitigation, and so forth) on raw ADC data before first dimension FFT until point cloud detection, with the least possible intervention .
- Fast FFT computation, with programmable FFT sizes (2, 4, 8..., 2048-pt, and 3, 6, 12, ..., 768, 1536-pt) complex-input FFT and (4, 8 ..., 4096-pt and 12, ..., 3072-pt) real-input FFT with improved throughput
- Operating clock frequency is 300 MHz
- Data path bit-width of 24-bits (24-bit I, 24-bit Q)
- Input and output data formatter: scaling, truncation, head/tail sample skipping, zero padding, flexible data flow and data sample arrangement to support efficient chaining of chirp processing operations and transpose accesses as required
- Capability to do all these operations in a single iteration: DC correction, interference zeroing out, complex multiplication, windowing, FFT, log, magnitude, stats computation with a capability of selecting/enabling or disabling/bypassing each of these computation blocks individually.
- Capability to do all these operations in a single iteration: DC correction, interference zeroing out, complex multiplication, windowing, FFT, with a capability of selecting/enabling or disabling/bypassing each of these computation blocks individually.
- 64KB local buffer/RAM split into eight 16KB banks, with each bank configurable as input or output for any compute/data transfer functionality.
- Flexible data flow and data sample arrangement to support efficient multi-dimensional operations and transpose accesses as required.
- Support for DC estimation and correction- Now supports 2 DC profiles
- Support for interference mitigation
 - Estimation and zeroing out of the interference samples by estimating the average of the magnitude of sudden spikes of vector elements, and applying scaled values as a threshold.
- Support for complex vector/scalar multiplications
- Complex windowing – 2K samples window RAM with a capability to split 1KB ping- 1KB pong to allow programming new coefficients while older ones are used.
- Up to 2K point FFT with efficiency of 1 sample output per cycle .
- Nested loop support in PARAM sets
- Compression engine with block floating and exponential Golomb modes with performance of 1 complex sample processing per cycle.
- Lock-step state machine
- ECC on the PARAM RAMs and parity on local buffers

6.2.2 Radar Accelerator Architecture

The Radar accelerator details are covered in [Chapter 24](#) , which consists of 2 parts.

The first part covers the high-level architecture and key features such as windowing, FFT, and log-magnitude. The (optional) second part covers additional features such as CFAR, complex multiplication, advanced statistics, radar data compression engine, and so forth.

6.3 Radar Subsystem

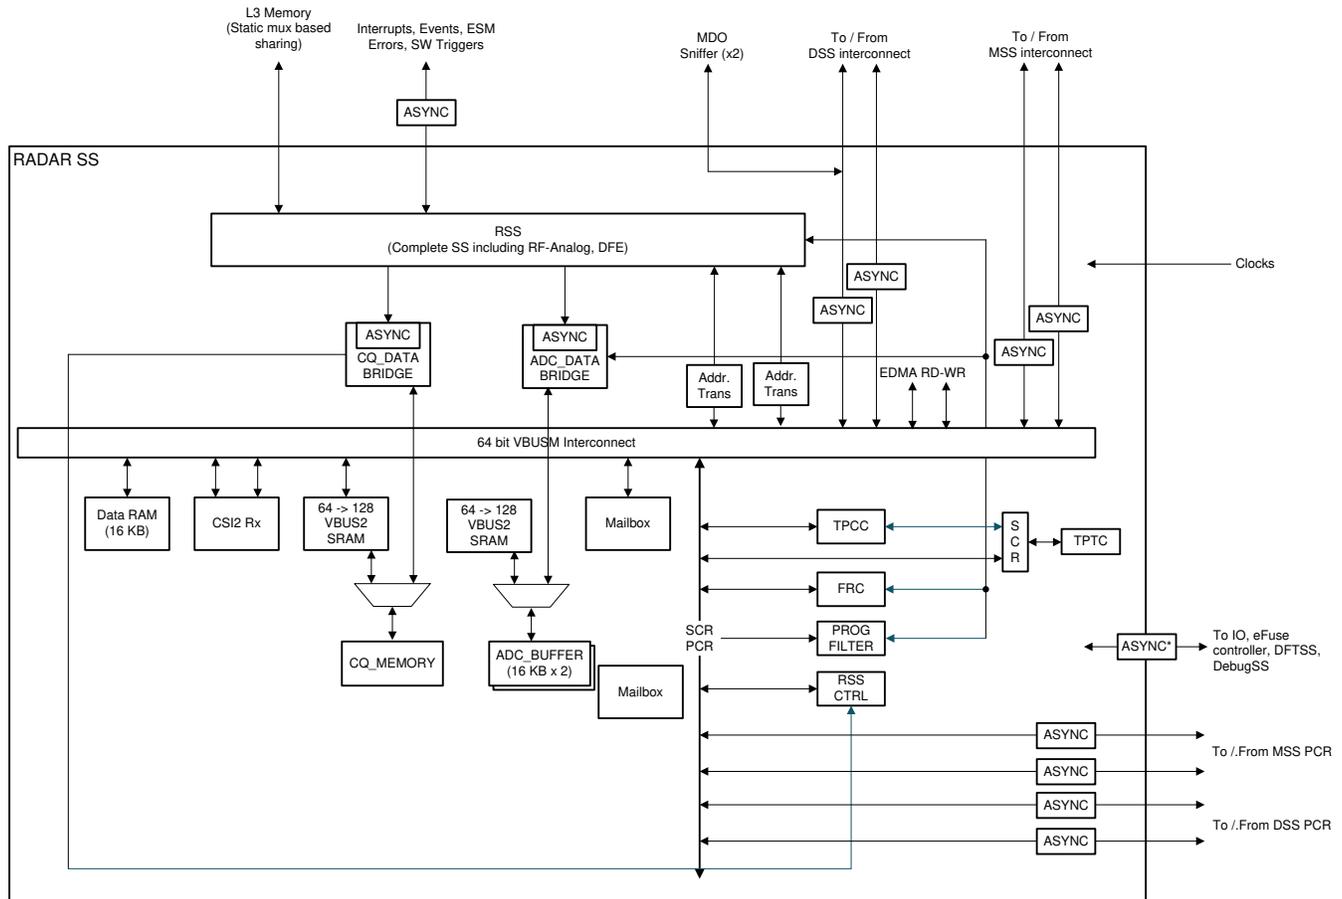

Figure 6-2. Block Diagram

6.3.1 BIST Subsystem

Figure 6-3 shows the BIST subsystem (BSS) block diagram.

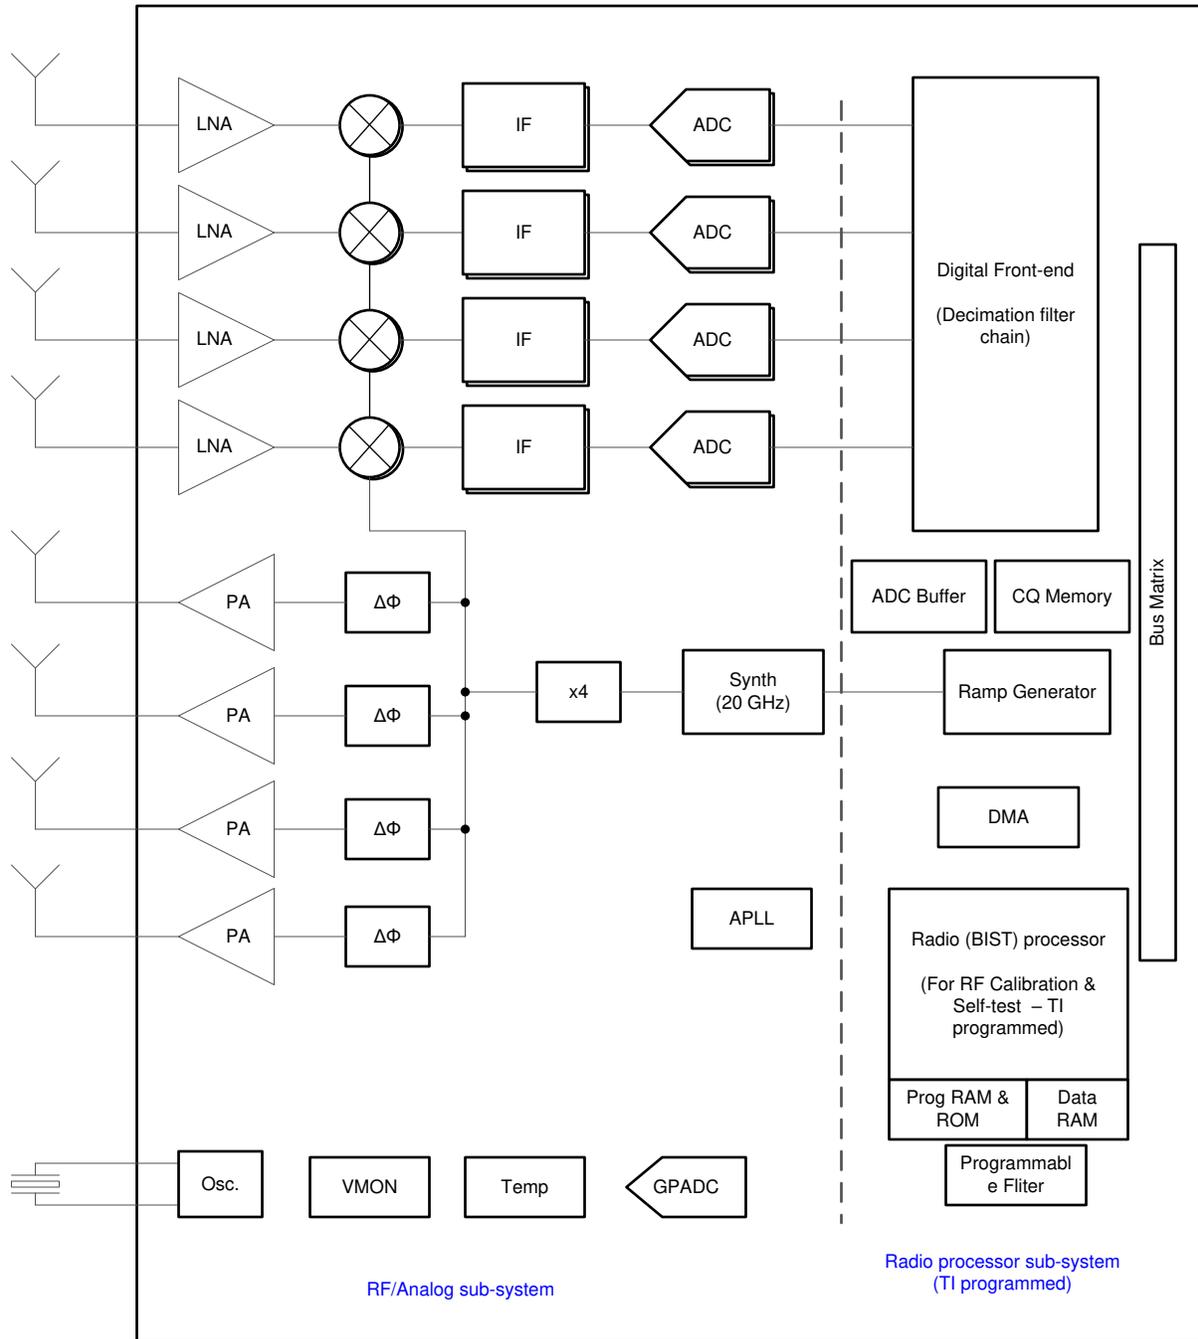

Figure 6-3. BIST Subsystem (BSS) Block Diagram

The BSS consists of the RF/Analog subsystem and the radio processor subsystem.

The RF/analog subsystem implements the frequency-modulated continuous-wave transceiver system with RF and analog circuitry – namely, the synthesizer, PA, LNA, mixer, IF, and ADC. This subsystem also includes the crystal oscillator and temperature sensors. The four transmit channels can be operated up to a maximum of two at a time simultaneously. The four receive channels can all be operated simultaneously.

The radio processor subsystem includes the digital front-end, the ramp generator, and an internal processor for controlling and configuring the low-level RF/analog and ramp generator registers, based on well-defined API messages from the main subsystem. This radio processor is programmed by TI, and addresses both RF

calibration needs and some basic self-test and monitoring functions (BIST); this processor is not available directly for customer use. The digital front-end filters and decimates the raw sigma-delta ADC output, and provides the final ADC data samples at a programmable sampling rate.

BSS core is by default under reset on device power-up, SBL (secondary bootloader) or user application needs to follow below sequence to bootup BSS core

1. Prepare BSS core and memory
 - a. `RSS_CTRL.BSS_CONTROL[30:28] = 0x0`
 - b. `RSS_CTRL.BSS_CONTROL[11:0] = 0x0`
 - c. `DSS_RCM.DSS_L3_BANKD1_PD_CTRL[2:0] = 0x0`
 - d. `RSS_CTRL.BSS_TCM_MEMINIT[0] = 0x1`
 - e. wait `RSS_CTRL.BSS_TCM_MEMINIT_DONE[0]` to be value 1
 - f. wait `RSS_CTRL.BSS_TCM_MEMINIT_STATUS[0]` to be 0
 - g. `RSS_PROC_CTRL.RSS_STATIC_MEM_MEMINIT[0] = 0x1`
 - h. wait `RSS_PROC_CTRL.RSS_STATIC_MEM_MEMINIT_DONE[0]` to be value 1
2. Load the BSS firmware or Patch content from sFlash to corresponding BSS RAMs (addresses are part of FW/Patch header content).
3. Unhalt the BSS core
 - a. `MSS_CTRL.MSS_PBIST_KEY_RST[0] = 0x0`
 - b. `RSS_PROC_CTRL.RSS_CR4_BOOT_INFO_REG0[31:16] = 0x0`
 - c. `RSS_PROC_CTRL.RSS_CR4_BOOT_INFO_REG1[31:16] = 0x0`
 - d. `RSS_PROC_CTRL.RSS_CR4_BOOT_INFO_REG0[15:0] = 0x28` (set XTAL Frequency 40MHz)
 - e. `RSS_PROC_CTRL.RSS_CR4_BOOT_INFO_REG1[15:0] = 0x28` (shadow)
 - f. `RSS_PROC_CTRL.RSS_CR4_BOOT_INFO_REG3[15:0] = 0x8080` (Mailbox config parameter for BSS to MSS communication)
 - g. `RSS_PROC_CTRL.RSS_CR4_BOOT_INFO_REG4[15:0] = 0x8080` (shadow)
 - h. `RSS_CTRL.BSS_CONTROL[26:24] = 0x0`
 - i. wait `RSS_PROC_CTRL.RSS_CR4_BOOT_INFO_REG0` to be value 0x18F0028 (for successful bootup complete)

Table 6-10. Description of `RSS_PROC_CTRL.RSS_CR4_BOOT_INFO_REG0`

Field Name	Bits	Description																		
XTAL Frequency	15:0	XTAL Frequency in MHz as an unsigned number																		
APLL Calibration Done	16	Expect value 1 on bootup done																		
APLL Calibration status	17	Expect value 1 on bootup done																		
BSS Boot Done	18	The bit will be set once the BSS boots up before entering the idle task loop																		
BSS Boot Status	19	The bit indicated that all the boot-time monitors have passed																		
BSS Fault Status	22:20	Firmware Fault Status Number <div style="text-align: center;"> Table 6-10. 26:25	RESERVED								
Reserved	31:27								

Note

Few set of registers from RSS_PROC_CTRL register space are needed for the application to read/write, those are provided in below table. Base address of RSS_PROC_CTRL is 0x0520 0000.

Table 6-11. RSS_PROC_CTRL Registers

Register Name	Description	Offset
RSS_CR4_BOOT_INFO_REG0	Bits defined by BSS FW, explained in above table	20h
RSS_CR4_BOOT_INFO_REG1	Shadow copy of REG0 register	24h
RSS_CR4_BOOT_INFO_REG2	Reserved	28h
RSS_CR4_BOOT_INFO_REG3	Boot time mailbox memory configuration by BSS. Bits 7:0 -> MSS Bits 15:8 -> DSS	2Ch
RSS_CR4_BOOT_INFO_REG4	Shadow copy of REG3 register	30h
RSS_CR4_BOOT_INFO_REG5	Configure BSS Logger: current configuration is Disabled. To Enable the BSS logger, set b[2:0] to 0x1. The debug data is transferred to a programmable MSS L2 memory buffer with a size of 2KB. The BSS splits this 2KB into two halves (ping and pong) to copy the debug logger data.	34h
RSS_CR4_BOOT_INFO_REG6	Configure MSS L2 offset for BSS Logger. Set MSS L2 translated address offset for BSS. e.g. 0xC0260000 is the translated address of MSS L2 memory 0x10260000. 2KB of memory is needed for BSS to transfer the BSS logger data. Applications are required to make sure the 2KB starting from 0x10260000 is reserved for BSS logger.	38h
RSS_CR4_BOOT_INFO_REG7	Reserved	3Ch

Table 6-11. RSS_PROC_CTRL Registers (continued)

Register Name	Description	Offset
RSS_STATIC_MEM_MEMINIT	Start Memory initialization of memory. Write 0x1 to start memory initialization. Write 0x0 after ensuring Memory initialization is in progress or has completed.	40h
RSS_STATIC_MEM_MEMINIT_DONE	Status field. Read value 0x1 indicates previously triggered Memory initialization of memory is complete. Write 0x1 to clear status.	44h
RSS_STATIC_MEM_MEMINIT_STATUS	Status field. Read value 0x1 indicates previously triggered Memory initialization of memory is in progress.	48h

The programming of this BSS is abstracted at a TI-defined API interface. Figure 6-4 explains the high-level architecture and programming model.

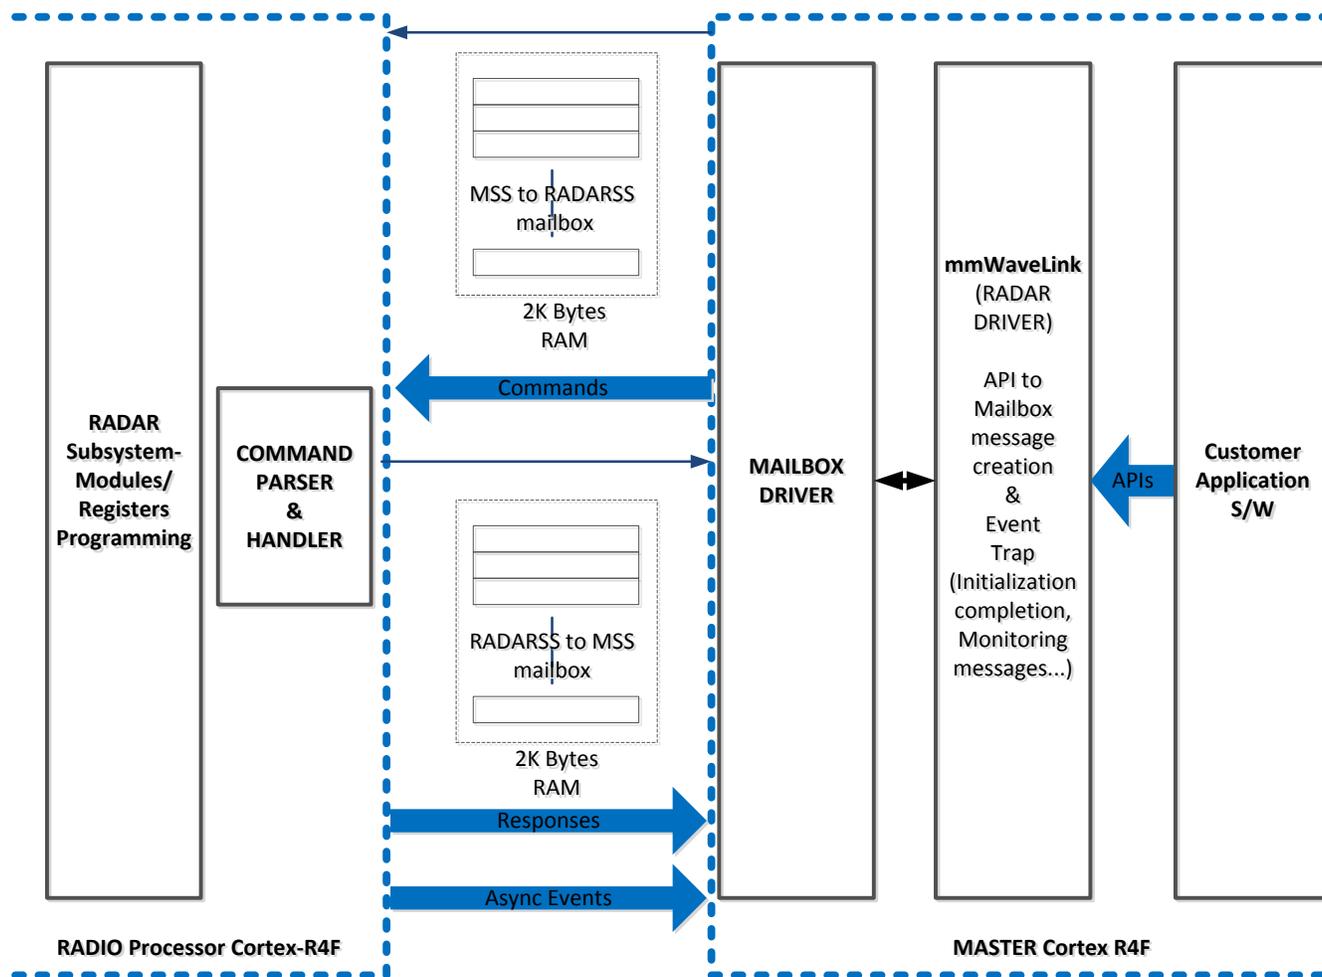

Figure 6-4. Programming Model

The radar subsystem is accessed through a well-defined set of APIs. The application software running on the main Cortex-R5F processor, through the API call, invokes the mmWaveLink-Radar driver, which then converts these APIs into mailbox-based messages. When a message is written into the mailbox memory, an interrupt is raised to the radio processor, which then passes the message and executes the command conveyed through the mailbox message. A mailbox message read event is raised to the main R5F to indicate the radio processor has read the message.

For more details, refer to the API interface control document (ICD).

Note

On device bootup, RadarSS will be in the reset state. It is responsibility of SBL (secondary bootloader) or main-application (R5F), to bring RadarSS core (R4F) out of reset, load BSS firmware/patch and then un-halts (execute) it. Please refer SBL source code in MCU-PLUS-SDK-AWR2544 for the right sequence.

6.3.2 Clock Subsystem

The AWR2544 clock subsystem generates 76-81 GHz from an input reference of a 40/50-MHz crystal. The subsystem has a built-in oscillator circuit, followed by a clean-up PLL and an RF synthesizer circuit, as shown in . The output of the RF synthesizer is then processed by an X4 multiplier to create the required frequency in the 76-81 GHz spectrum. The RF synthesizer output is modulated by the timing engine block to create the required waveforms for effective sensor operation. The timing engine is highly flexible and is programmed through the R4F-based radio controller subsystem. For details on waveforms and programming models, refer to the Radio Control API application note.

The clean-up PLL provides a reference clock for the host processor after system wakeup.

The clock subsystem has built-in mechanisms for detecting the presence of a crystal and monitoring the quality of the generated clock.

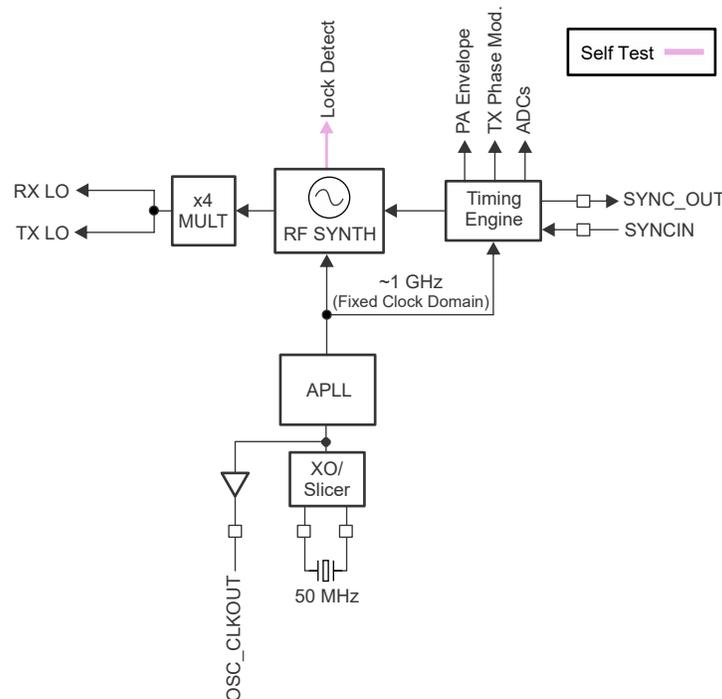

Figure 6-5. Clocking Subsystem

6.3.3 Transmit Subsystem

The transmit subsystem consists of four parallel transmit chains, each with independent phase and amplitude control, as shown in Figure 6-6. All transmit chains can be operational at the same time. The device supports binary phase modulation for MIMO radar and interference mitigation.

Each transmit chain is capable of delivering optimal power at the antenna port on the PCB, and supports programmable back-off for system optimization.

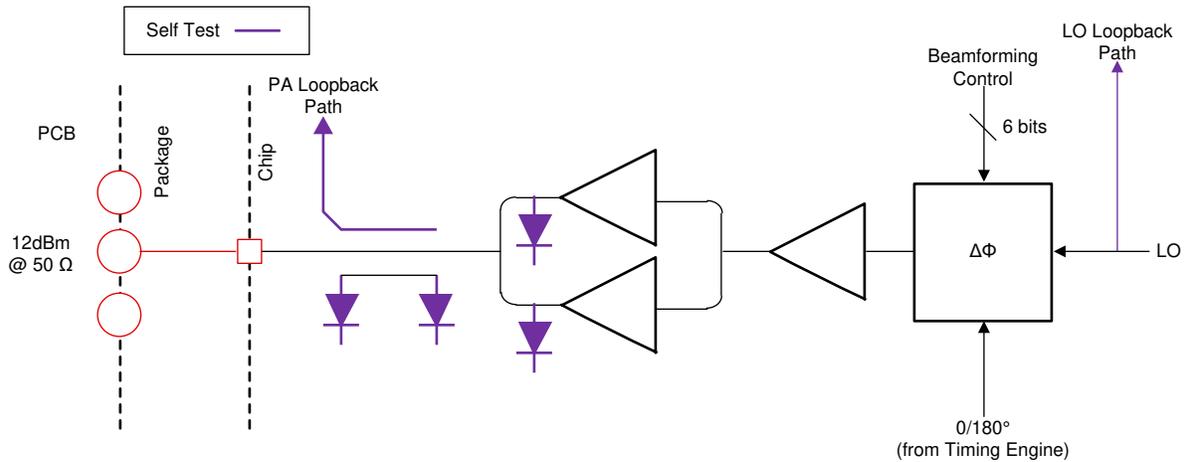

Figure 6-6. Transmit Subsystem

6.3.4 Receive Subsystem

The AWR2544 receive subsystem consists of four parallel channels, as shown in . A single receive channel consists of an LNA, mixer, IF filtering, A2D conversion, and decimation. All four receive channels can be operational at the same time. An individual power down option is also available for system optimization.

The AWR2544 device supports an I-Only baseband architecture for each receiver channel. The AWR2544 is targeted for fast chirp systems. The bandpass IF chain has configurable lower cutoff frequencies above 350 kHz, and can support bandwidths up to 15 MHz.

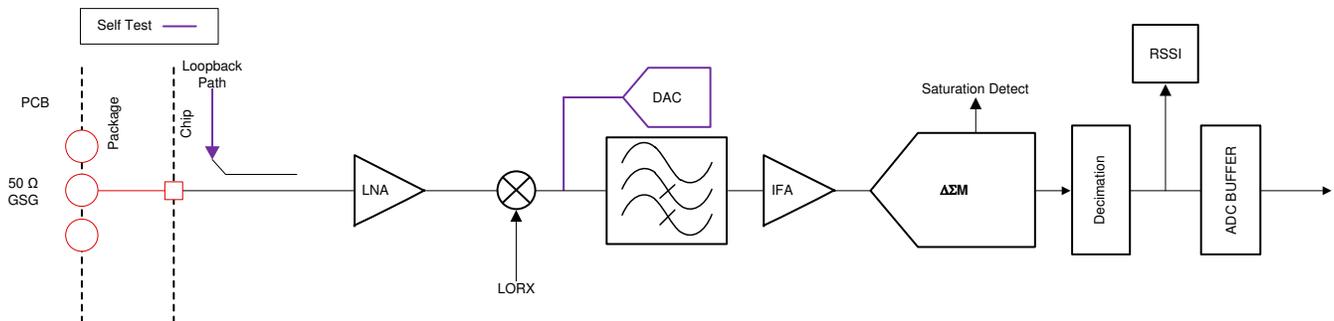

Figure 6-7. Receive Subsystem (Per Channel)

6.3.5 Real(I-only) Receiver in AWR2544

In FMCW radar with complex baseband (IQ) receiver, the beat frequency signals from various objects are on one-side of the complex baseband spectrum as shown in the diagram below.

Therefore, a real-only receiver chain is sufficient for FMCW radar operation, including range, velocity, and angle estimation.

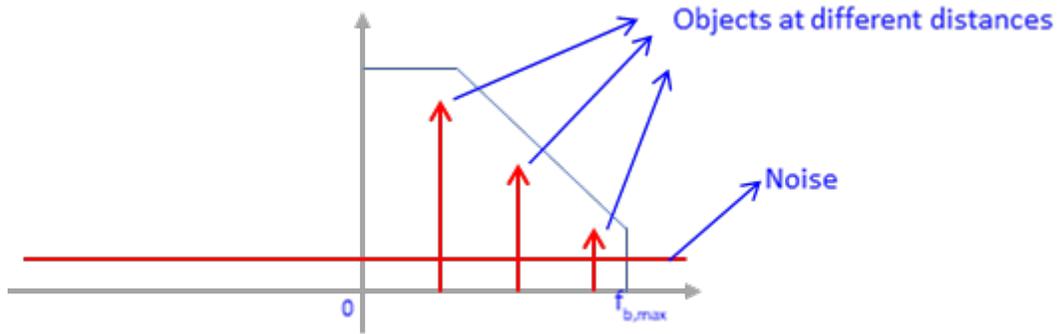

Figure 6-8. Complex Baseband Spectrum

Although theoretically, IQ receiver can provide 3 dB SNR improvement over I-only receiver, in practice, the SNR improvement is less than 1dB for IQ over I-only receiver, after taking into consideration the IQ splitter losses. Also, with circuit optimizations, the AWR2544 device is able to achieve comparable noise-figure with real-only implementation (in comparison with IQ architecture).

There is significant power and area savings for I-only architecture, and hence it is chosen as the architecture for single chip radar device like AWR2544. Using HWA1.5, the interference detection and mitigation capability is also improved, and this enables interference-related glitches in the real ADC data to be suppressed.

This page intentionally left blank.

This section lists the various interrupts sources supported in the different subsystem of device

7.1 Main Subsystem Cortex R5F Interrupt Map

Table 7-1. Main Subsystem Cortex R5F Interrupt Map

Interrupt Number	Define Name	Level/Pulse	Description
0	MSS_ESM_HI	Level	ESM High Priority Interrupt
1	MSS_ESM_LO	Level	ESM Low Priority Interrupt
2	CR5SS_STC_DONE	Pulse	Cortexr5ss subsystem STC complete interrupt
3	MSS_RTIA_INT0	Level	RTIA compare interrupt
4	MSS_RTIA_INT1	Level	RTIA compare interrupt
5	MSS_RTIA_INT2	Level	RTIA compare interrupt
6	MSS_RTIA_INT3	Level	RTIA compare interrupt
7	MSS_RTIA_OVERFLOW_INT0	Level	RTIA overflow interrupt
8	MSS_RTIA_OVERFLOW_INT1	Level	RTIA overflow interrupt
9	MSS_RTIB_INT0	Level	RTIB compare interrupt
10	MSS_RTIB_INT1	Level	RTIB compare interrupt
11	MSS_RTIB_OVERFLOW_INT0	Level	RTIB overflow interrupt
12	MSS_RTIB_OVERFLOW_INT1	Level	RTIB overflow interrupt
13	MSS_RTIC_INT0	Level	RTIC compare interrupt
14	MSS_RTIC_INT1	Level	RTIC compare interrupt
15	MSS_RTIC_OVERFLOW_INT0	Level	RTIC overflow interrupt
16	MSS_RTIC_OVERFLOW_INT1	Level	RTIC overflow interrupt
17	MSS_WDT_INT0	Level	WDT compare interrupt
18	MSS_WDT_INT1	Level	WDT compare interrupt
19	MSS_WDT_INT2	Level	WDT compare interrupt
20	MSS_WDT_INT3	Level	WDT compare interrupt
21	MSS_WDT_OVERFLOW_INT0	Level	WDT over flow interrupt
22	MSS_WDT_OVERFLOW_INT1	Level	WDT over flow interrupt
23	MSS_WDT_TB_INT	Level	WDT time base interrupt
24	MSS_MCRC_INT	Level	Interrupt from MCRC
25	MSS_DCCA_INT	Level	MSS_DCCA Clock compare done interrupt
26	MSS_DCCB_INT	Level	MSS_DCCB Clock compare done interrupt
27	MSS_DCCC_INT	Level	MSS_DCCC Clock compare done interrupt
28	MSS_DCCD_INT	Level	MSS_DCCD Clock compare done interrupt

Table 7-1. Main Subsystem Cortex R5F Interrupt Map (continued)

Interrupt Number	Define Name	Level/Pulse	Description
29	MSS_CCCA_INT	Level	MSS_CCCA dual clock compare done interrupt
30	MSS_CCCB_INT	Level	MSS_CCCB dual clock compare done interrupt
31	MSS_SPIA_INT0	Level	MSS_SPIA level 0 interrupt
32	MSS_SPIA_INT1	Level	MSS_SPIA level 1 interrupt
33	MSS_SPIB_INT0	Level	MSS_SPIB level 0 interrupt
34	MSS_SPIB_INT1	Level	MSS_SPIB level 1 interrupt
35	MSS_QSPI_INT	Pulse	MSS_QSPI interrupt
36	MSS_GIO_INT0	Level	MSS_GIO high-level Interrupt
37	MSS_GIO_INT1	Level	MSS_GIO low-level interrupt
38	MSS_ETPWMA_INT0	Level	MSS_ETPWMA Interrupt 0 which is a output to pad
39	MSS_ETPWMA_INT1	Level	MSS_ETPWMA Interrupt 1 which is a output to pad
40	MSS_ETPWMB_INT0	Level	MSS_ETPWMB Interrupt 0 which is a output to pad
41	MSS_ETPWMB_INT1	Level	MSS_ETPWMB Interrupt 1 which is a output to pad
42	MSS_ETPWMC_INT0	Level	MSS_ETPWMC Interrupt 0 which is a output to pad
43	MSS_ETPWMC_INT1	Level	MSS_ETPWMC Interrupt 1 which is a output to pad
44	MSS_CPSW_CPTS_COMP	Level	CPSW Time Stamping Trigger
45	MSS_CPTS_GENF0	Level	CPSW Generating Function 0
46	MSS_CPTS_GENF1	Level	CPSW Generating Function 1
47	MSS_CPTS_GENF2	Level	CPSW Generating Function 2
48	FHOST_EOQ_INT[0]	Level	End of Queue Interrupt form Host
49	FHOST_EOQ_INT[1]	Level	End of Queue Interrupt form Host
50	FHOST_EOQ_INT[2]	Level	End of Queue Interrupt form Host
51	FHOST_EOQ_INT[3]	Level	End of Queue Interrupt form Host
52	MSS_I2C_INT	Pulse	MSS_I2C interrupt
53	MSS_SCIA_INT0	Level	MSS_SCIA level0 input
54	MSS_SCIA_INT1	Level	MSS_SCIA level1 input
55	MSS_SCIB_INT0	Level	MSS_SCIB level0 input
56	MSS_SCIB_INT1	Level	MSS_SCIB level1 input
57	TOP_PBIST_DONE_INT	Pulse	TOP_PBIST done interrupt
58	MSS_GIO_PAD_INT0	Pulse	Interrupt Triger from GIO[0][0]
59	MSS_GIO_PAD_INT1	Pulse	Interrupt Triger from GIO[0][1]
60	MSS_GIO_PAD_INT2	Pulse	Interrupt Triger from GIO[0][2]
61	MSS_GIO_PAD_INT3	Pulse	Interrupt Triger from GIO[0][3]
62	FHOST_EOQ_INT[4]	Level	End of Queue Interrupt form Host
63	FHOST_EOQ_INT[5]	Level	End of Queue Interrupt form Host
64	FHOST_EOQ_INT[6]	Level	End of Queue Interrupt form Host
65	FHOST_EOQ_INT[7]	Level	End of Queue Interrupt form Host
66	RESERVED	RESERVED	RESERVED
67	MSS_TPCC_A_INTAGG	Level	MSS_TPCC_A Aggregated Functional Interrupt

Table 7-1. Main Subsystem Cortex R5F Interrupt Map (continued)

Interrupt Number	Define Name	Level/Pulse	Description
68	RESERVED	Level	
69	MSS_TPCC_A_ERRAGG	Level	MSS_TPCC_A Agregated Error Interrupt
70	RESERVED	Level	
71	MSS_GPADC_IFM_DONE	Level	MSS_GPADC ifm done interrupt
72	MSS_CPSW_TH_TRSH_INT	Pulse	MSS CPSW T-host threshold interrupt
73	MSS_CPSW_TH_INT	Pulse	MSS CPSW T-host interrupt
74	MSS_CPSW_FH_INT	Pulse	MSS CPSW F-host interrupt
75	MSS_CPSW_MISC_INT	Pulse	MSS CPSW interrupt
76	RESERVED	RESERVED	RESERVED
77	MSS_CR5A_MBOX_READ_REQ	Level	Aggregated interrupt to MSS CR5A from other processor asking it to read
78	MSS_CR5A_MBOX_READ_ACK	Level	Aggregated interrupt to MSS CR5A from other processor saying the reading from their mailbox is done.
79	RESERVED	RESERVED	RESERVED
80	RESERVED	RESERVED	RESERVED
81	RESERVED	RESERVED	RESERVED
82	TOP_DEBUGSS_TXDATA_AVAL	Pulse	Interrupt from TOP_DEBUGSS
83	MSS_CR5A_PMU_INT	Pulse	Pmu Interrupt from MSS_CR5A
84	RESERVED	RESERVED	RESERVED
85	MSS_CR5A_FPU_INT	Pulse	Floating point expection from MSS_CR5A
86	RESERVED	RESERVED	RESERVED
87	RESERVED	RESERVED	RESERVED
88	CR5A_CTI_IRQ	Level	IRQ request from CTI module from CR5A
89	RESERVED	RESERVED	RESERVED
90	RESERVED	RESERVED	RESERVED
91	MSS_SW_INT0	Pulse	Software Interrupt from MSS_CTRL
92	MSS_SW_INT1	Pulse	Software Interrupt from MSS_CTRL
93	MSS_SW_INT2	Pulse	Software Interrupt from MSS_CTRL
94	MSS_SW_INT3	Pulse	Software Interrupt from MSS_CTRL
95	MSS_SW_INT4	Pulse	Software Interrupt from MSS_CTRL
96	RESERVED	RESERVED	RESERVED
97	MSS_PERIPH_ACCESS_ERRAGG	Level	Aggregation of all access-erros from mpu and control spaces
98	MSS_CR5A_AHB_WR_ERR	Pulse	MSS_CR5A ahb brige getting write response as a error
99	RESERVED	RESERVED	RESERVED
100	DTHE_SHA_S_INT	Level	Interrupt form HSM_SHA

Table 7-1. Main Subsystem Cortex R5F Interrupt Map (continued)

Interrupt Number	Define Name	Level/Pulse	Description
101	DTHE_SHA_P_INT	Level	Interrupt form HSM_SHA
102	DTHE_TRNG_INT	Level	Interrupt form HSM_TRNG
103	DTHE_PKAE_INT	Level	Interrupt form HSM_PKAE
104	DTHE_AES_S_INT	Level	Interrupt form HSM_AES
105	DTHE_AES_P_INT	Level	Interrupt form HSM_AES
106	RESERVED	RESERVED	RESERVED
107	MSS_RTIB_INT2	Level	RTIB compare interrupt
108	MSS_RTIB_INT3	Level	RTIB compare interrupt
109	MSS_RTIC_INT2	Level	RTIC compare interrupt
110	MSS_RTIC_INT3	Level	RTIC compare interrupt
111-119	RESERVED	RESERVED	RESERVED
120	DSS_TPCC_A_INTAGG	Level	DSS_TPCC_A Aggregated Functional Interrupt
121	DSS_TPCC_A_ERRAGG	Level	DSS_TPCC_A Agregated Error Interrupt
122-125	RESERVED	Level	RESERVED
126	DSS_PERIPH_ACCESS_ERRAGG	Level	Aggregation of access-erros from DSS peripherals. See Error access Response Section for more details
127-128	RESERVED	RESERVED	RESERVED
129	DSS_DSP_PBIST_CTRL_DONE	Pulse	DSS DSP PBIST Controller Done Interrupt
130	DSS_SW_INT0	Pulse	SW Interrupt generated by writing 0x1 to register DSS_CTRL.DSS_SW_INT[0]
131	DSS_SW_INT1	Pulse	SW Interrupt generated by writing 0x1 to register DSS_CTRL.DSS_SW_INT[1]
132	DSS_SW_INT2	Pulse	SW Interrupt generated by writing 0x1 to register DSS_CTRL.DSS_SW_INT[2]
133	DSS_SW_INT3	Pulse	SW Interrupt generated by writing 0x1 to register DSS_CTRL.DSS_SW_INT[3]
134	RESERVED	RESERVED	RESERVED
135	RESERVED	RESERVED	RESERVED
136	DSS_MCRC_INT	Level	DSS MCRC Interrupt
137-141	RESERVED	RESERVED	RESERVED
142	RSS_ADC_CAPTURE_COMPLETE	Pulse	Raw ADC capture complete interrupt from DFE-DSP bridge
143	DSS_CBUFF_INT	Pulse	DSS CBUFF Interrupt
144	DSS_CBUFF_INT_ERR	Pulse	DSS CBUFF Error Interrupt
145	DSS_HWA_THREAD1_LOOP_INTERRUPT	Pulse	DSS_HWA Thread1 Loop complete interrupt
146	DSS_HWA_THREAD1_PARAM_DONE_INTR	Pulse	DSS_HWA Thread1 Param done interrupt
147	RESERVED	RESERVED	RESERVED
148	RESERVED	RESERVED	RESERVED
149	RESERVED	RESERVED	RESERVED

Table 7-1. Main Subsystem Cortex R5F Interrupt Map (continued)

Interrupt Number	Define Name	Level/Pulse	Description
150	DFE_FRAME_START_TO_DSS	Pulse	Frame start interrupt from BSS.
151	RSS_TPCC_A_INTAGG	Level	RSS_TPCC_A Aggregated Functional Interrupt
152	RSS_TPCC_A_ERRAGG	Level	RSS_TPCC_A Aggregated Error Interrupt
153	ADC_VALID_FALL_EDGE	Pulse	Interrupt is trigger during Falling edge of ADC valid
154	DFE_FRAME_START_TO_MSS	Pulse	Frame start interrupt from RSS which can be masked by RSS.
155	DFE_CHIRP_CYCLE_START	Pulse	Chirp cycle start interrupt from DFE
156	DFE_CHIRP_CYCLE_END	Pulse	Chirp cycle end interrupt from DFE
157	DFE_END_OF_FRAME	Pulse	End of Frame interrupt from DFE
158	RSS_FRC_FRAME_START	Pulse	Frame start interrupt from FRC
159	RSS_ADC_CAPTURE_COMPLETE_DITH	Pulse	ADC capture complete interrupt from DFE-DSP bridge after dithering
160	DSS_HWA_THREAD2_LOOP_INTERRUPT	Pulse	DSS_HWA Thread2 Loop complete interrupt
161	DSS_HWA_THREAD2_PARAM_DONE_INTERRUPT	Pulse	DSS_HWA Thread2 Param done interrupt
162	DSS_WDT_TB_INTERRUPT	Level	DSS WDT Time Base Interrupt
163	DSS_HWA_LOCAL_RAM_ERROR	Level	DSS_HWA Local RAM access error
164-187	RESERVED	Level	RESERVED
188	DSS_SW_INTERRUPT_RSS_PROC_CTRL0	Pulse	Interrupt from RSS_PROC_CTRL
189	DSS_SW_INTERRUPT_RSS_PROC_CTRL1	Pulse	Interrupt from RSS_PROC_CTRL
190	DSS_SW_INTERRUPT_RSS_PROC_CTRL2	Pulse	Interrupt from RSS_PROC_CTRL
191	DSS_SW_INTERRUPT_RSS_PROC_CTRL3	Pulse	Interrupt from RSS_PROC_CTRL
192	RSS_DATA_CAPTURE_ENABLE_FALL	Pulse	Interrupt is triggered data_capture enable fall from DFE-DSP bridge (toggles after completion of every chirp)
193-206	RESERVED	RESERVED	RESERVED
207	RSS_EXT_SYNC_OUT	Pulse	rss_int_map[29]
208	RSS_EXT_SYNC_IN	Pulse	rss_int_map[30]
209-218	RESERVED	RESERVED	RESERVED
219	RSS_BSS_CR4_STC_COMPLETE	Pulse	CR4 STC test complete
220	RSS_FRC_EVT_GEN_1	Pulse	rss_int_map[51]
221	RSS_FRC_EVT_GEN_2	Pulse	rss_int_map[52]
222	RSS_FRC_EVT_GEN_3	Pulse	rss_int_map[53]
223	RSS_FRC_EVT_GEN_4	Pulse	rss_int_map[54]
224	RSS_FRC_TS_1_TRIG	Pulse	rss_int_map[55]
225	RSS_FRC_TS_2_TRIG	Pulse	rss_int_map[56]
226	RSS_FRC_TS_3_TRIG	Pulse	rss_int_map[57]

Table 7-1. Main Subsystem Cortex R5F Interrupt Map (continued)

Interrupt Number	Define Name	Level/Pulse	Description
227	RSS_FRC_TS_4_TRIG	Pulse	rss_int_map[58]
228	RESERVED	RESERVED	RESERVED
229	MSS_GIO_PAD_INT4	Pulse	Interrupt Triger from MSS GIO[1][0]
230	MSS_GIO_PAD_INT5	Pulse	Interrupt Triger from MSS GIO[1][1]
231	MSS_GIO_PAD_INT6	Pulse	Interrupt Triger from MSS GIO[1][2]
232	MSS_GIO_PAD_INT7	Pulse	Interrupt Triger from MSS GIO[1][3]
233-235	RESERVED	RESERVED	RESERVED
236	DSS_CSI_INT	Level	DSS_CSITX Aggregated Interrupt form the IP
237	DSS_CSI_PARITY_ERROR	Level	Parity Error form DSS_CSITX
238-255	RESERVED	RESERVED	RESERVED

7.2 Main Subsystem ESM Interrupt Map

Table 7-2. Main Subsystem ESM Interrupt Map Group 1

ESM GROUP1	Define Name	Description
127:125	RESERVED	RESERVED
124	DSS_CSI_VBUSP2OCP_ACCESS_ERR	CSI access error when an SOC master is trying to access DSS_CSI_TX
123	ANA_WU_AND_CLK_STATUS_ERR	Aggregated Error from ANA_WU_STATUS_REG and ANA_CLK_STATUS_REG
122	MSS_BUS_SAFETY_CR5B_AHB	AHB bridges safety Error for Cr5B - Comparision Error of all outputs from AHB bridge of CR5A
121	MSS_BUS_SAFETY_CR5A_AHB	AHB bridges safety Error for Cr5A - Comparision Error of all outputs from AHB bridge of CR5A
120-112	RESERVED	RESERVED
111	MSS_BUS_SAFETY_MSS2R5SS	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X) - ECC Uncorrectable Data Error - Compare Error on Control
110	MSS_BUS_SAFETY_DSS2R5SS	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X) - ECC Uncorrectable Data Error - Compare Error on Control
109	MSS_BUS_SAFETY_R5SS2MSS	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X) - ECC Uncorrectable Data Error - Compare Error on Control
108	MSS_BUS_SAFETY_R5SS2DSS	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X) - ECC Uncorrectable Data Error - Compare Error on Control
107	DSS_TPCC_A_ERRAGG	
106	DSS_CBUFF_SBE_ERR	DSS_CBUFF FIFO Single Bit error

Table 7-2. Main Subsystem ESM Interrupt Map Group 1 (continued)

ESM GROUP1	Define Name	Description
105	DSS_CBUFF_DBE_ERR	DSS_CBUFF FIFO Double Bit error
104	DSS_CBUFF_SAFETY_ERR	DSS_CBUFF FIFO Safety error
103	MPU_DSS_L3_BANKA_ADDR_ERR	MPU Addressing Error for DSS_(X)_MPU_ADDR_ERR
102	MPU_DSS_L3_BANKB_ADDR_ERR	MPU Addressing Error for DSS_(X)_MPU_ADDR_ERR
101	MPU_DSS_L3_BANKA_PROT_ERR	MPU Addressing Error for DSS_(X)_MPU_PROT_ERR
100	MPU_DSS_L3_BANKB_PROT_ERR	MPU Addressing Error for DSS_(X)_MPU_PROT_ERR
99	DSS_ECC_AGGR_UERR	DSS ECC AGGR Un-Correctable Error - DSS_L3_BANKA/B - DSS_TPTC_A0/1 FIFO
98	DSS_ECC_AGGR_SERR	DSS ECC AGGR Correctable Error - DSS_L3_BANKA/B - DSS_TPTC_A0/1 FIFO
97	DSS_HWA_GRP1/2_ERR	or of HWA group1 or group2 error
96	DSS_L3_BANKA_ECC_UERR	DSS_L3_BANKA Uncorrectable ECC Error
95	DSS_L3_BANKB_ECC_UERR	DSS_L3_BANKB Uncorrectable ECC Error
94	DSS_L3BANKA_ACCESS_ERR	
93	DSS_L3BANKB_ACCESS_ERR	
92	CSI_TX_PARITY_ERROR	Parity ERROR from CSI TX Buffers
91	MSS_BUS_SAFETY_CR5A_SLV	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X) - ECC Uncorrectable Data Error - Compare Error on Control
89 to 90	RESERVED	RESERVED
88	MSS_MPU_MSS2DSS_ADDR_ERR	MPU Addressing Error for MSS_MPU_(X)_ADDR_ERR
87	MSS_MPU_MSS2DSS_PROT_ERR	MPU Protection Error for MSS_MPU_(X)_ADDR_ERR
86	MSS_MPU_MBOX_ADDR_ERR	MPU Addressing Error for MSS_MPU_(X)_ADDR_ERR
85	MSS_MPU_MBOX_PROT_ERR	MPU Protection Error for MSS_MPU_(X)_ADDR_ERR
84	MSS_MPU_L2_BANKA_ADDR_ERR	MPU Addressing Error for MSS_MPU_(X)_ADDR_ERR
83	MSS_MPU_L2_BANKA_PROT_ERR	MPU Protection Error for MSS_MPU_(X)_ADDR_ERR
82	MSS_MPU_L2_BANKB_ADDR_ERR	MPU Addressing Error for MSS_MPU_(X)_ADDR_ERR
81	MSS_MPU_L2_BANKB_PROT_ERR	MPU Protection Error for MSS_MPU_(X)_ADDR_ERR
80	MSS_MPU_DTHE_ADDR_ERR	MPU Addressing Error for MSS_MPU_(X)_ADDR_ERR
79	MSS_MPU_PCRA_ADDR_ERR	MPU Addressing Error for MSS_MPU_(X)_ADDR_ERR
78	MSS_MPU_QSPI_ADDR_ERR	MPU Addressing Error for MSS_MPU_(X)_ADDR_ERR
77	MSS_MPU_CR5A_SLV_ADDR_ERR	MPU Addressing Error for MSS_MPU_(X)_ADDR_ERR
76	MSS_MPU_L2_BANKC_ADDR_ERR	MPU Addressing Error for MSS_MPU_(X)_ADDR_ERR

Table 7-2. Main Subsystem ESM Interrupt Map Group 1 (continued)

ESM GROUP1	Define Name	Description
75	MSS_MPU_HSM_SLV_ADDR_ERR	MPU Addressing Error for MSS_MPU_(X)_ADDR_ERR
74	MSS_MPU_DTHE_PROT_ERR	MPU Addressing Error for MSS_MPU_(X)_ADDR_ERR
73	MSS_MPU_PCRA_PROT_ERR	MPU Protection Error for MSS_MPU_(X)_ADDR_ERR
72	MSS_MPU_QSPI_PROT_ERR	MPU Protection Error for MSS_MPU_(X)_ADDR_ERR
71	MSS_MPU_CR5A_SLV_PROT_ERR	MPU Protection Error for MSS_MPU_(X)_ADDR_ERR
70	MSS_MPU_L2_BANKC_PROT_ERR	MPU Protection Error for MSS_MPU_(X)_ADDR_ERR
69	MSS_MPU_HSM_SLV_PROT_ERR	MPU Protection Error for MSS_MPU_(X)_ADDR_ERR
68	MSS_CPSW_SERR	Cpsw memories Single bit error pulse
67	MSS_CPSW_UERR	Cpsw memories Double bit error pulse
66	MSS_BUS_SAFETY_SEC_AGG_ERR	Aggregated error for SEC from all Nodes in MSS_SCR
64 to 65	RESERVED	RESERVED
63	ANA_LIMP_MODE	Error signal from analog if the CLK monitor finds the REF CLK to be outside the permissible range of frequency
62	MSS_MCRC_ERR	MCRC Comparison Error
61	MSS_DCCA_ERR	DCCA frequency comparison error
60	MSS_DCCB_ERR	DCCB frequency comparison error
59	MSS_DCCC_ERR	DCCC frequency comparison error
58	MSS_DCCD_ERR	DCCD frequency comparison error
57	MSS_CCCA_ERR	CCCA frequency comparison error
56	MSS_CCCB_ERR	CCCB frequency comparison error
55	MSS_SPIA_SERR	Single Bit correctable error indication for MIBSPI-A multi-buffer
54	MSS_SPIB_SERR	Single Bit correctable error indication for MIBSPI-B multi-buffer
53	MSS_SPIA_UERR	Multi Bit uncorrectable error indication for MIBSPI-A multi-buffer
52	MSS_SPIB_UERR	Multi Bit uncorrectable error indication for MIBSPI-B multi-buffer
51	RSS_TPCC_A_ERRAGG	RSS_TPCC_A Aggregated Error Interrupt - TPCC Error - TPCC MPU Error - TPTC Error for all TPTCs connected to TPCC - Read and Write Config Space Access error to TPCC - Read and Write Config Space Access error or all TPTCs connected to TPCC
50	RSS_ECC_AGG_SERR	SEC error from ECC-AGGREGATOR which controls ADC_BUF_Memories and TPTC-memories
49	RSS_ECC_AGG_UERR	DED error from ECC-AGGREGATOR which controls ADC_BUF_Memories and TPTC-memories
48-45	RESERVED	RESERVED
44	MSS_TCMA_CR5A_SERR	Single Bit correctable error indication for ATCM of CR5A

Table 7-2. Main Subsystem ESM Interrupt Map Group 1 (continued)

ESM GROUP1	Define Name	Description
43	MSS_TCMB1_CR5A_SERR	Single Bit correctable error indication for B1TCM of CR5A
42	MSS_TCMB0_CR5A_SERR	Single Bit correctable error indication for B0TCM of CR5A
41-39	RESERVED	RESERVED
38	MSS_CR5A_ITAG_SERR	Single Bit correctable error indication for Cache ITAG of CR5A
37	MSS_CR5A_IDATA_SERR	Single Bit correctable error indication for Cache IDATA of CR5A
36	MSS_CR5A_DTAG_SERR	Single Bit correctable error indication for Cache DTAG of CR5A
35	MSS_CR5A_DDATA_SERR	Single Bit correctable error indication for Cache DDATA of CR5A
34-31	RESERVED	RESERVED
30	MSS_TPCC_A_AGG_ERR	MSS_TPCC_A Aggregated Error Interrupt
		- TPCC Error
		- TPCC MPU Error
		- TPTC Error for all TPTCs connected to TPCC
		- Read and Write Config Space Access error to TPCC
29-28	RESERVED	RESERVED
		RESERVED
27	EFUSE_ERR	Reserved for efuse errors
26	MSS_STC_ERR	STC Error indication for MSS Cortex5ss
25	MSS_CCMR5_ST_ERR	CORTEXR5-Sub System Self test error for CCMR5 (comparator module)
24	RESERVED	RESERVED
23	QSPI_WR_ERR	QSPI write error
22	MSS_ECC_AGGR_CR5A_SERR	MSS ECC AGGR for CR5A Memories Correctable Error
		- MSS_VIM_CR5A
		- MSS_CR5A_CACHES (only for injection. Error is sent out through event bus)
		- MSS_CR5A_TCMs (only for injection. Error is sent out through event bus)
21-19	RESERVED	RESERVED
18	MSS_ECC_AGGR_SERR	MSS ECC AGGR Correctable Error
		- MSS_L2_BANKA/B
		- MSS_MBOX
		- MSS_RETRAM
		- MSS_GPADC
		- MSS_TPTC_A0/1 FIFO
- MSS_TPTC_B0 FIFO		

Table 7-2. Main Subsystem ESM Interrupt Map Group 1 (continued)

ESM GROUP1	Define Name	Description
17	MSS_ECC_AGGR_UERR	MSS ECC AGGR Un-Correctable Error
		- MSS_L2_BANKA/B
		- MSS_MBOX
		- MSS_RETRAM
		- MSS_GPADC
		- MSS_TPTC_A0/1 FIFO
		- MSS_TPTC_B0 FIFO
16	MSS_L2_BANKC_ACC_ERR	MSS_L2_BANKC access Error when accessed during power down
15	MSS_L2_BANKB_ACC_ERR	MSS_L2_BANKB access Error when accessed during power down
14	MSS_L2_BANKA_ACC_ERR	MSS_L2_BANKA access Error when accessed during power down
13-4	RESERVED	RESERVED
3	BSS_ESM_LO	ESM IRQ from BSS
2	BSS_ESM_HI	ESM FIQ from BSS
1	HSM_ESM_LO	ESM IRQ from HSM
0	HSM_ESM_HI	ESM FIQ from HSM

Table 7-3. Main Subsystem ESM Interrupt Map Group 2

ESM GROUP2	Define Name	Description
31 to 30	RESERVED	RESERVED
29	MSS_BUS_SAFETY_L2_BANKC	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X) - ECC Uncorrectable Data Error - Compare Error on Control
28	MSS_L2_BANKC_ECC_UERR	MSS_L2_BANKC Uncorrectable ECC Error
27	MSS_DCCA_ERR	DCCA Frequency comparison error
26	BSS_ESM_HI	ESM FIQ from BSS
25	ANA_WU_AND_CLK_STATUS_ERR	Aggregated Error from ANA_WU_STATUS_REG and ANA_CLK_STATUS_REG
24	MSS_BUS_SAFETY_CR5A_MST_RD	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
23	MSS_BUS_SAFETY_CR5B_MST_RD	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
22	MSS_BUS_SAFETY_CR5A_MST_WR	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
21	MSS_BUS_SAFETY_CR5B_MST_WR	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control

Table 7-3. Main Subsystem ESM Interrupt Map Group 2 (continued)

ESM GROUP2	Define Name	Description
20	MSS_BUS_SAFETY_L2_BANKA	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
19	MSS_BUS_SAFETY_L2_BANKB	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
18	MSS_BUS_SAFETY_PCRA	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control
17	MSS_BUS_SAFETY_PCRB	MSS Bus Safety Error for the Node MSSS_BUS_SAFETY_(X)
		- ECC Uncorrectable Data Error
		- Compare Error on Control

The ADC buffer is on-chip memory arranged as a ping-pong buffer, with ECC support for each ping and pong memory. The raw ADC output data from RADAR-SS is stored on this memory, to be consumed by the DSP, or by the hardware FFT accelerator for the post processing.

For the application software, the ADC buffer (either ping or pong) is seen as a single memory at the base address.

RadarSS generates Chirp Parameter (CP) and Chirp Quality (CQ) data along with ADC data. Interface Control Document (ICD) explains CP/CQ data format and steps to enable this feature. Refer ICD for the latest supported features towards CP/CQ/ADC of the device.

8.1 Functional Description

Figure 8-1 shows the block diagram of the ADC buffer scheme. The two data input sources to the ADC buffer are:

- Raw ADC output data from the digital front end (DFE)
- Ramp pattern data from the test pattern generator

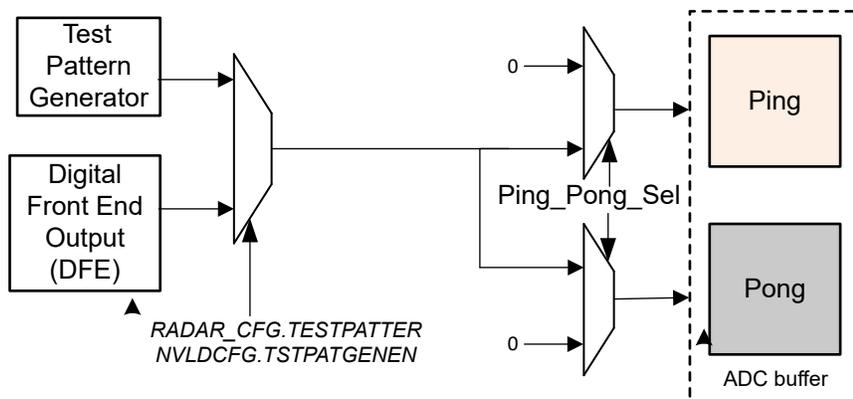

Figure 8-1. ADC Buffer Block Diagram

8.1.1 DFE Data Write Operation

The ADC buffer can be written from DFE in any of the three modes by configuring the control registers ADCBUFCFG1, ADCBUFCFG2, ADCBUFCFG3, and ADCBUFCFG4 in APP_HWA_ADCBUF_CTRL address space:

1. Single-chirp mode
2. Multi-chirp mode
3. Continuous mode

The DFE data from the three Rx channels can be independently enabled by programming the register ADCBUFCFG1.

In single-chirp mode, the FMCW chirp data from the DFE is written to the ADC buffer on a per chirp basis, and a chirp available interrupt is generated on the completion of the write data operation at the end of the chirp,

as shown in Figure 8-2. ADC buffer control logic generates the Ping_Pong_Sel signal, as shown in Figure 8-2, which controls whether the data is written into either ping or pong buffer. Data write can start from either the ping or pong buffer.

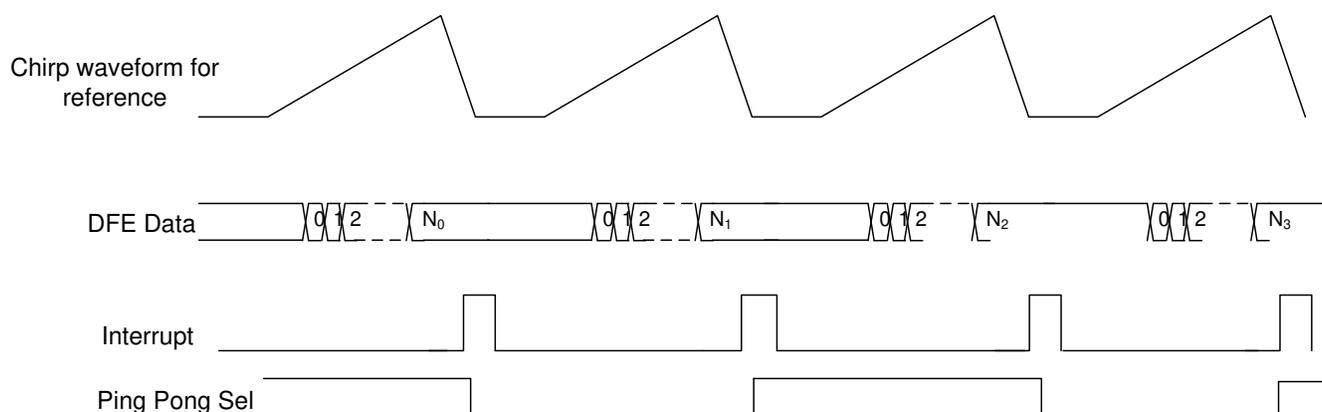

Figure 8-2. Single-Chirp Mode

In multi-chirp mode, ADC samples for N chirps are stored in a ping/pong buffer before the Ping Pong Select toggles and the Chirp Available Interrupt is generated. The number of chirps stored in the ping and the pong buffer are configured in the register field ADCBUFNUMCHRPING.

shows the programming sequence for the ADC buffer single-chirp and multi-chirp modes.

Note

Registers for ping and pong must be programmed with the same value for correct functionality.

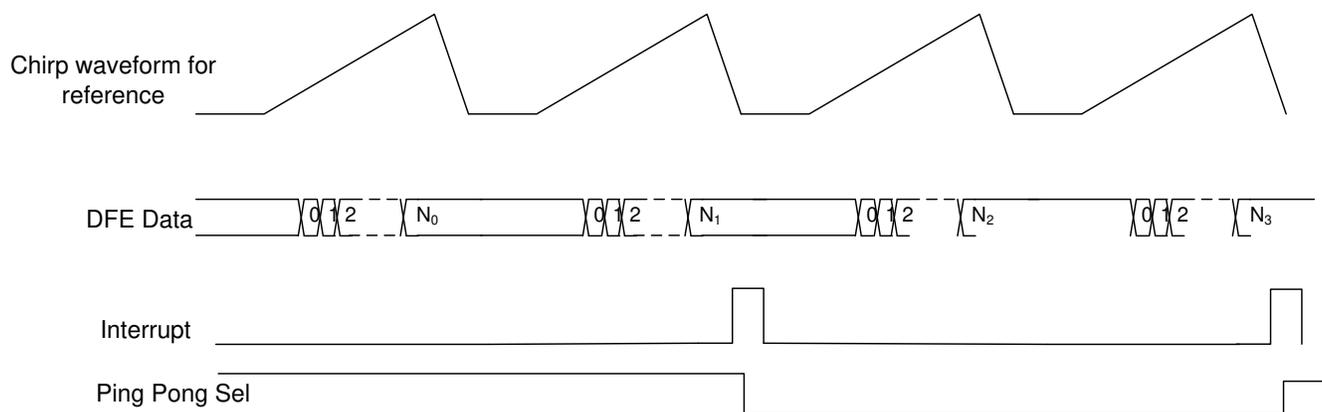

Figure 8-3. Multi-Chirp Mode

In continuous mode, where the FMCW transceiver is configured to output a single frequency tone in the range of X-Y GHz (where X is start and Y is end frequency supported by the device), 'N' ADC samples are stored in a ping/pong buffer before the Ping Pong Select toggles and the Chirp Available Interrupt is generated. The value N is configured in the field APP_HWA_ADCBUF_CTRL.ADCBUFCFG4.ADCBUFSAMPCNT. In real mode, this value N refers to the number of real samples per channel, and in complex mode, this refers to the number of complex samples per channel. This counter increments once for every new sample (as long as 1 or more Rx channels are enabled). Continuous mode is expected to be only used for CZ and ADC buffer testpattern mode.

shows the programming sequence for ADC buffer continuous mode.

8.1.2 Test Pattern Generator Support

An internal test pattern generator which outputs a ramp pattern helps during the initial software development and debug. The output of this module is muxed with the DFE data before sending it to the ADC buffers, as shown in [Figure 8-1](#). Because this is meant for testing the path from the ADC buffer until the final output through LVDS, the ADC buffer configurations must be set to continuous streaming mode, in which the ping-pong switch is based on the number of samples. The test pattern generator can be configured by programming the register TESTPATTERNVLDCFG in the RADAR_CFG address space. Additional configurable registers are provided for configuring the ramp pattern output from the test pattern generator, such as offset at the start of ramp, step size, and so forth. Refer to the RSS_CTRL address space and test pattern generator-related registers for further information.

8.1.3 ADC Buffer Data Formats

The data is written in the following formats to the ADC buffer:

- Non-interleaved data format

8.1.3.1 Non-Interleaved Data Format

In non-interleaved mode storage, each channel data is stored in different memory locations, as shown in [Table 8-1](#).

Table 8-1. Non-Interleaved Data Format

RX0(3)	RX0(2)	RX0(1)	RX0(0)
RX0(7)	RX0(6)	RX0(5)	RX0(4)

Chapter 9

Ethernet SubSystem (MCU_CPSW0)

This chapter describes the Ethernet MAC (Media Access Controller). For conceptual purposes the below documentation refers to this MAC as being a two port CPSW with port 0 being the CPPI DMA host port and port 1 being the Ethernet port.

9.1 MCU_CPSW0 Overview.....	2376
9.2 MCU_CPSW0 Environment.....	2379
9.3 MCU_CPSW0 Integration.....	2382
9.4 MCU_CPSW0 Functional Description.....	2384
9.5 MCU_CPSW0 Programming Guide.....	2480
9.6 MSS_CPSW Registers.....	2483

9.1 MCU_CPSW0 Overview

The two-port Ethernet MAC (MCU_CPSW0) subsystem provides Ethernet packet communication for the device and is configured in a similar manner as a two-port Ethernet switch. MCU_CPSW0 features the Reduced Gigabit Media Independent Interface (RGMI), Reduced Media Independent Interface (RMII), and the Management Data Input/Output (MDIO) interface for physical layer device (PHY) management.

The device has integrated two-port Ethernet Switch subsystem into device MCU domain named MCU_CPSW0.

Figure 9-1 shows the MCU_CPSW0 module overview.

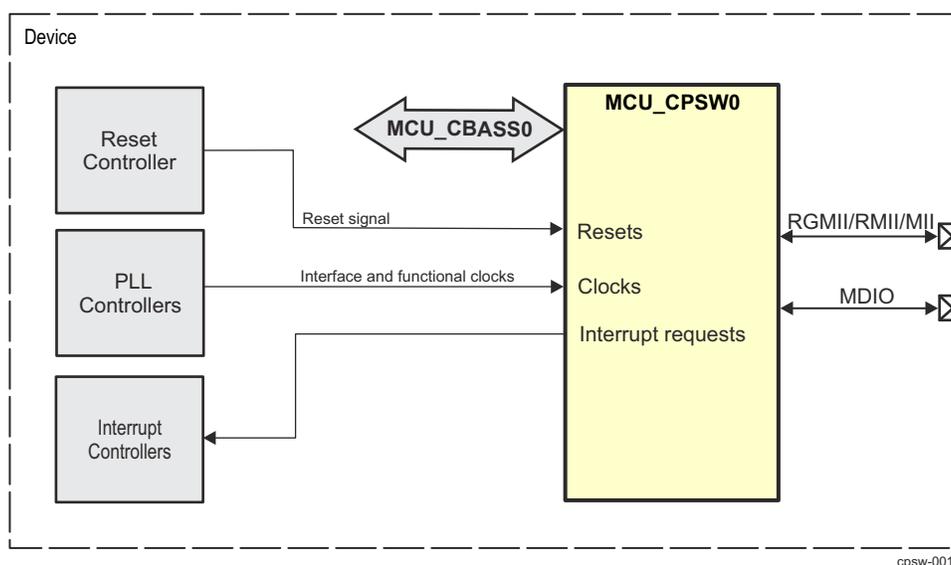

Figure 9-1. MCU_CPSW0 Overview

9.1.1 MCU_CPSW0 Features

The MCU_CPSW0 subsystem provides the following features:

- One Ethernet port with selectable MII, RMII and RGMII interfaces (port 1).
- One CPDMA CPPI DMA Host Interface (Port 0)
- Synchronous 10/100 Mbit operation
- Flexible logical FIFO-based packet buffer structure
- Eight priority level Quality Of Service (QOS) support (802.1p)
- Support for Audio/Video Bridging (P802.1Qav/D6.0) (**C**redit **B**ased **S**haper)
- Support for IEEE 1588 Clock Synchronization (2008 Annex D, Annex E and Annex F)
 - Timestamp module capable of time stamping external timesync events like Pulse-Per-Second and also generating Pulse-Per-Second outputs
 - CPTS module that supports time stamping for IEEE1588 with support for 4 hardware push events and generation of compare output pulses
- DSCP Priority Mapping (IPv4 and IPv6)
- Energy Efficient Ethernet (EEE) support (802.3az)
- Flow Control (802.3x) Support
- Non Blocking switch fabric
- Time Sensitive Network Support
 - IEEE 802.1Qbv/D2.2 Enhancements for Scheduled Traffic
- Address Lookup Engine (ALE)
 - Configurable number of addresses plus VLANs
 - Wire rate lookup
 - Host controlled time-based aging and/or auto-aging
 - Spanning tree support

- L2 address lock and L2 filtering support
- MAC authentication (802.1x)
- Receive-based or destination-based Multicast and Broadcast rate limits
- MAC address blocking
- Source port locking
- OUI (Vendor ID) host accept/deny feature
- Configurable number of classifier/policers
- VLAN support
 - 802.1Q compliant
 - Auto add port VLAN for untagged frames on ingress
 - Auto VLAN removal on egress and with pad to minimum frame size
- EtherStats and 802.3Stats Remote network Monitoring (RMON) statistics gathering (per port)
- Ethernet or Castagnoli CRC selectable on Ethernet egress
- Digital Loopback supported (Ethernet egress to Ethernet ingress)
- OAM Loopback supported (FIFO Loopback - port ingress to egress including host port)
- CPSGMII Loopback Modes (Ethernet egress to Ethernet ingress)
- Maximum frame size of 2024 bytes (including VLAN)
- Management Data Input/Output (MDIO) module for PHY Management with Clause 45 support
- Programmable interrupt control with selected interrupt pacing
- Emulation support
- Full duplex mode supported in 10/100 Mbps. Half-duplex mode supported only in 10/100 Mbps modes only.
- RAM Error Detection and Correction (SECDED)
- InterVLAN Routing is supported - 4 routes per egress port.
- Automotive Security Features
 - VLANs can be configured to not allow fragmented IPv4 frames (that is, fragmented IPv4 traffic)
 - VLANs can be configured to only allow up to four different IPv4 Protocols or IPv6 Next Header values
 - Drop invalid source addresses, that is drop Source Addresses with bit 40 set (Multicast/Broadcast indicator on Destination Addresses)
 - Drop frames that the IEEE802.3 length is not contained within the frame. (Ether Types 0-1500)
 - Any source address can be secured to a port dropping any attempts from other ports to masquerade as a service
 - Any source or destination address can be blocked
 - Per port or per VLAN ingress checking, dropping traffic from non-member ports
 - Classification, policing on L2 and L3 information

9.1.2 MCU_CPSW0 Not Supported Features

The following MCU_CPSW0 features are not supported:

- GMII Mode
- SGMII Mode
- MACSEC
- Synchronous Ethernet
- Software reset
- Rate-limiting is not supported in half-duplex mode
- Dual VLAN switch operations are not supported
- RGMII Internal Delay Mode disabled.
- Priority based flow control is not supported.
- InterVLAN routed packets will be dropped if the FIFO room is insufficient regardless of receive 803.3x flow control.

9.1.3 Terminology

Terminology:

AVB	Audio Video Bridging
AVBTP	Audio Video Bridging Transport Protocol
BMCA	Best Master Clock Algorithm
CFI	Canonical Format Indicator
CPPI	Communications Port Programming Interface
DLR	Device Level Ring
DSCP	Differentiated Services Code Point
EEE	Energy Efficient Ethernet
EMAC	Ethernet Media Access Control
EOP	End of Packet
EOQ	End of Queue
IPG	Inter-Packet Gap
LPI	Low Power Indicator
MDIO	Management Data Input/Output
MOF	Middle of Frame
OUI	Organizationally Unique Identifier
PTP	Precision Time Protocol
RMON	Remote Monitoring
RTCP	RTP Control Protocol
RTP	Real-time Transport Protocol
SCR	Switched Central Resource
SRP	Stream Reservation Protocol
TOS	Type of Service
VLAN	Virtual Local Area Network
CPSW_2G	CPSW two port

9.2 MCU_CPSW0 Environment

9.2.1 MCU_CPSW0 RMIi Interface

Figure 9-2 shows a device with integrated RMIi and MDIO interface connection in a typical system. The individual MCU_CPSW0 and MDIO signals for the RMIi interface are summarized in Table 9-1.

For more information, refer to either the IEEE 802.3 standard or ISO/IEC 8802-3:2000(E).

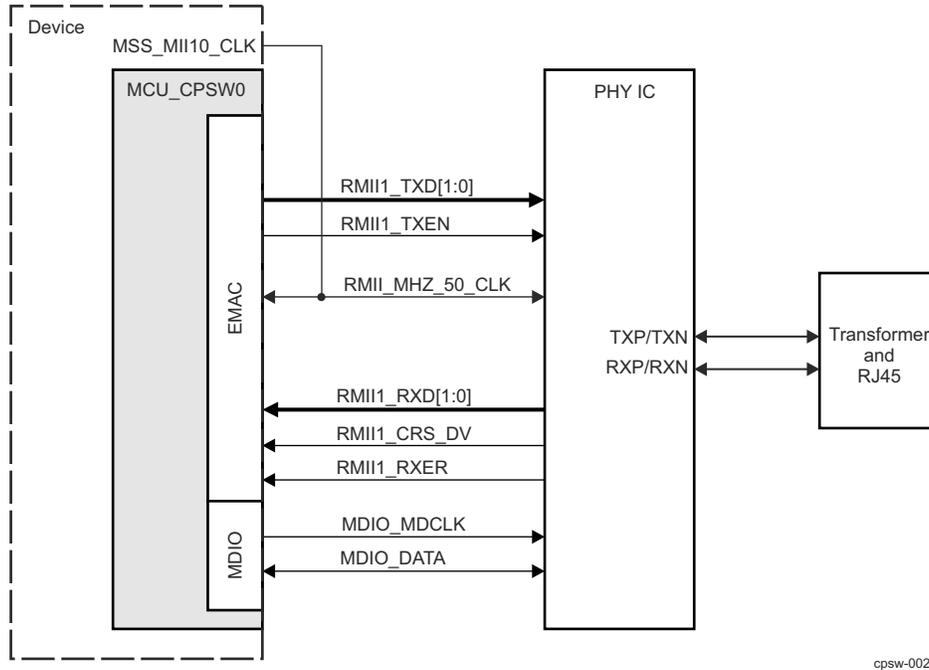

Figure 9-2. RMIi Interface Typical Application

Table 9-1. RMIi I/O Description

Signal	Device Pin	I/O ⁽¹⁾	Description
RMII_TXD[1:0]	MCU_RMII_TXD[1:0]	O	Transmit data. The transmit data pins are a collection of 2 bits of data. TXD0 is the least-significant bit (LSB). The signals are synchronized by RMII_MHZ_50_CLK and valid only when RMII_TXEN is asserted.
RMII_TXEN	MCU_RMII_TX_EN	O	RMII transmit enable. The transmit enable signal indicates that the MCU_RMII_TXD pins are generating data for use by the PHY. RMII_TXEN is synchronous to RMII_MHZ_50_CLK.
RMII_MHZ_50_CLK	MCU_RMII_REF_CLK	I	RMII 50MHz reference clock. The reference clock is used to synchronize all RMII signals. RMII_MHZ_50_CLK must be continuous and fixed at 50 MHz. This bit controls the clock source MSS_CTRL::CPSW_CONTROL::CPSW_CONTROL_RMII_REF_CLK_OE_N
RMII_RXD[1:0]	MCU_RMII_RXD[1:0]	I	Receive data. The receive data pins are a collection of 2 bits of data. RXD0 is the least-significant bit (LSB). The signals are synchronized by RMII_MHZ_50_CLK and valid only when RMII_CRS_DV is asserted and RMII_RXER is de-asserted.
RMII_CRS_DV	MCU_RMII_CRS_DV	I	Carrier sense/receive data valid. Multiplexed signal between carrier sense and receive data valid.
RMII_RXER	MCU_RMII_RX_ER	I	Receive error. The receive error signal is asserted to indicate that an error was detected in the received frame.
MDIO_MDCLK	MCU_MDIO_CLK	O	Management data clock (MDIO_MDCLK). The MDIO data clock is sourced by the MDIO module on the system. It is used to synchronize MDIO data access operations done on the MCU_MDIO0_DATA pin.

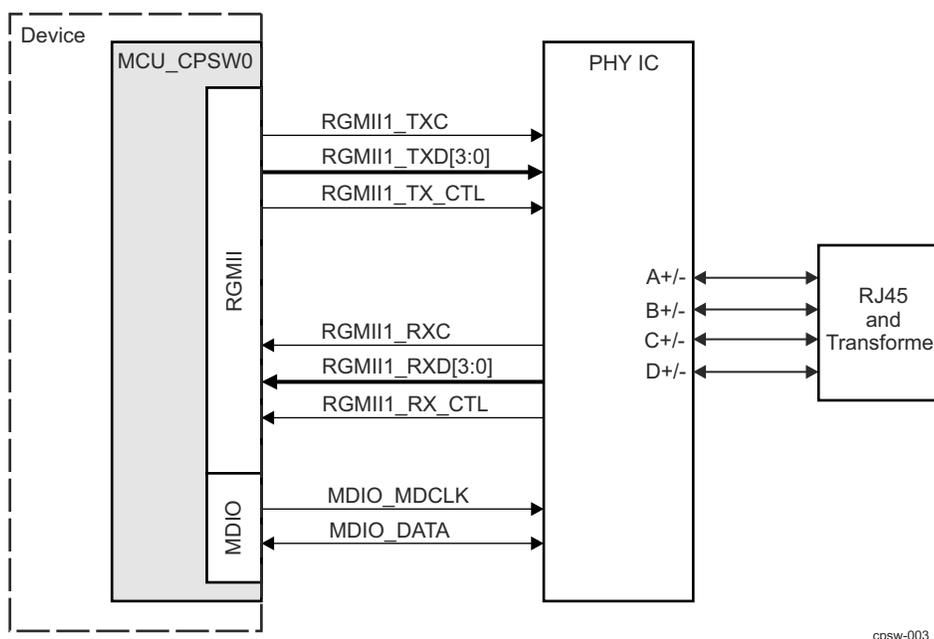

Table 9-1. RGMII I/O Description (continued)

Signal	Device Pin	I/O ⁽¹⁾	Description
MDIO_DATA	MCU_MDIO_DATA	I/O	MDIO data pin drives PHY management data into and out of the PHY by way of an access frame consisting of start of frame, read/write indication, PHY address, register address, and data bit cycles. The MCU_MDIO0_DATA pin acts as an output for all but the data bit cycles at which time it is an input for read operations.

(1) I = Input; O = Output

9.2.2 MCU_CPSW0 RGMII Interface

Figure 9-3 shows a device with integrated RGMII and MDIO interface connection in a typical system. The individual MCU_CPSW0 and MDIO signals for the RGMII interface are summarized in Table 9-2.

Figure 9-3. RGMII Interface Typical Application
Table 9-2. RGMII I/O Description

Signal	Device Pin(s)	I/O ⁽¹⁾	Description
RGMII_TXD[3:0]	MCU_RGMII_TD[3:0]	O	The transmit data pins are a collection of 4 bits of data. TD0 is the least-significant bit (LSB). The signals are valid only when RGMII_TX_CTL is asserted.
RGMII_TX_CTL	MCU_RGMII_TX_CTL	O	Transmit Control/enable. The transmit enable signal indicates that the TD pins are generating data for use by the PHY.
RGMII_TXC	MCU_RGMII_TXC	O	The transmit reference clock. The clock is 2.5 MHz at 10 Mbps operation, 25 MHz at 100 Mbps operation, and 125 MHz at 1000 Mbps* of operation.
RGMII_RXD[3:0]	MCU_RGMII_RD[3:0]	I	The receive data pins are a collection of 4 bits of data. RD0 is the least-significant bit (LSB). The signals are valid only when RGMII_RX_CTL is asserted
RGMII_RX_CTL	MCU_RGMII_RX_CTL	I	The receive data valid/control signal indicates that the RD pins are nibble data for use by the EMAC.
RGMII_RXC	MCU_RGMII_RXC	I	The receive clock is a continuous clock that provides the timing reference for receive operations. The clock is generated by the PHY and is 2.5 MHz at 10 Mbps operation, 25 MHz at 100 Mbps operation, 125 MHz at 1000 Mbps* of operation.

Table 9-2. RGMII I/O Description (continued)

Signal	Device Pin(s)	I/O ⁽¹⁾	Description
MDIO_MDCLK	MCU_MDIO_CLK	O	Management data clock (MDIO_MDCLK). The MDIO data clock is sourced by the MDIO module on the system. It is used to synchronize MDIO data access operations done on the MCU_MDIO0_DATA pin.
MDIO_DATA	MCU_MDIO_DATA	I/O	The MCU_MDIO0_DATA pin drives PHY management data into and out of the PHY by way of an access frame consisting of start of frame, read/write indication, PHY address, register address, and data bit cycles. The MCU_MDIO0_DATA pin acts as an output for all but the data bit cycles at which time it is an input for read operations.

(1) I = Input; O = Output

Note

The Control Module registers assign the specific function to the device pads. For more information on Control Module settings, see , Pad Configuration Registers in *Control Module (CTRL_MMR)* and the device-specific Datasheet.

9.3 MCU_CPSW0 Integration

Figure 9-4 shows the integration of the MCU_CPSW0 module in the device.

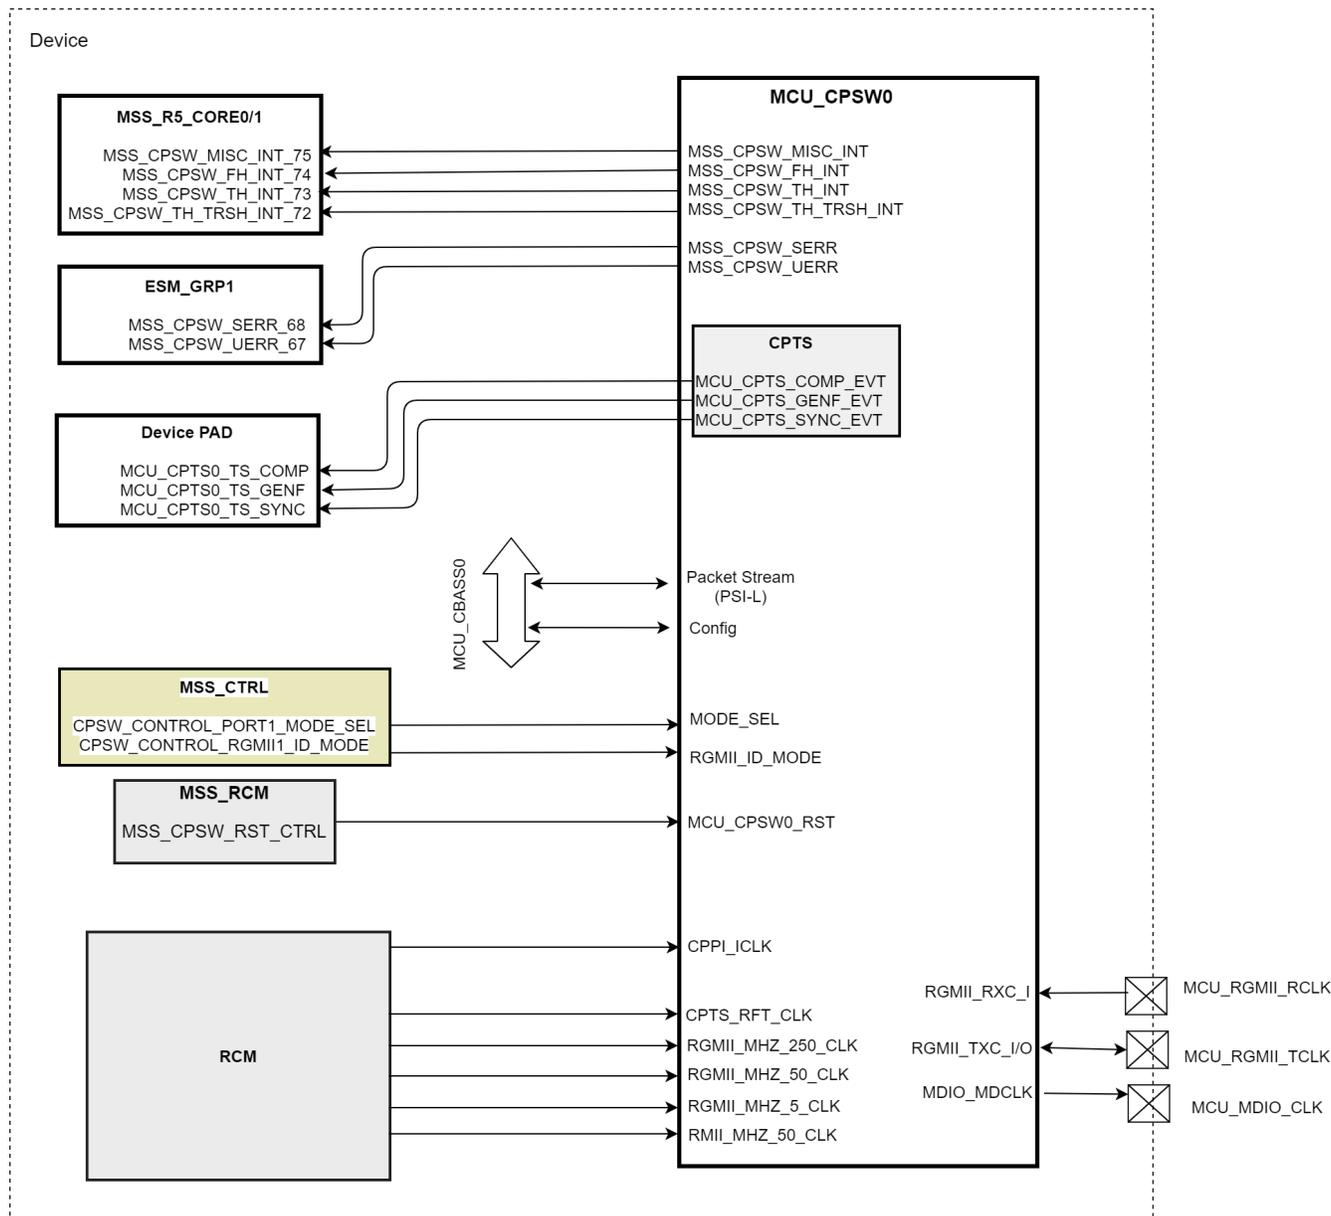

Figure 9-4. MCU_CPSW0 Integration

Below Tables summarize the integration of the MCU_CPSW0 module in the device.

Table 9-3. MCU_CPSW0 Clocks and Resets

Clocks			
Module Instance	Module Clock Input	Reference/Source	Description
MCU_CPSW0	CPPI_CLK	MSS_RCM::CPSW_CLK	CPPI packet streaming interface clock. Main clock for MCU_CPSW0.
	CPTS_RFT_CLK	MSS_RCM::MSS_CPTS_CLK	Time sync Reference Clock 400/250/divided
	RGMII_MHZ_5_CLK	MSS_RCM::MSS_MII10_CLK	5-MHz RGMII reference clock.
	RGMII_MHZ_50_CLK	MSS_RCM::MSS_MII100_CLK	50-MHz RGMII reference clock.

Table 9-3. MCU_CPSW0 Clocks and Resets (continued)

RGMII_MHZ_250_CLK	MSS_RCM::MSS_RGMII_CLK	250-MHz RGMII reference clock.
RMII_MHZ_50_CLK	MSS_RCM::MSS_MII100_CLK	50-MHz RMI reference clock.

Resets			
Module Instance	Module Reset Input	Reference/Source	Description
MCU_CPSW0	MCU_CPSW0_RST	MCSS_RCM::MSS_CPSW_RST_CTRL	IP Reset

Table 9-4. MCU_CPSW0 Hardware Requests

Interrupt Requests				
Module Instance	Module Interrupt Signal	Destination Interrupt Input	Description	Type
MCU_CPSW0	MCU_CPSW_STAT_PEND	MSS_CPSW_MISC_INT_75	MCU_CPSW0 statistic pending interrupt 0	Pulse
	MCU_CPSW_EVNT_PEND	MSS_CPSW_MISC_INT_75	MCU_CPSW0 event pending interrupt	Pulse
	MCU_CPSW_MDIO_INTR	MSS_CPSW_MISC_INT_75	MCU_CPSW0 MDIO interrupt	Pulse
	MCU_CPSW_THost_INT	MSS_CPSW_TH_INT_73	MCU_CPSW0 T-host interrupt	Pulse
	MCU_CPSW_FHost_INT	MSS_CPSW_FH_INT_74	MCU_CPSW0 F-host interrupt	Pulse
	MCU_CPSW_TH_TRSH_INT	MSS_CPSW_TH_TRSH_INT_72	MCU_CPSW0 TH-threshold interrupt	Pulse
	MCU_CPSW_ECC_SEC_INT	MCU_ESM_EVT_68	MCU_CPSW0 SEC ECC error interrupt	Pulse
	MCU_CPSW_ECC_DED_INT	MCU_ESM_EVT_67	MCU_CPSW0 SEC DED error interrupt	Pulse

Time Sync and Compare Events				
Module Instance	Module Event	Device Pin	Description	Type
MCU_CPSW0	MCU_CPSW_COMP_EVT	MCU_CPTS0_TS_COMP	MCU_CPSW0 compare event interrupt	Edge
	MCU_CPSW_GENF_EVT	MCU_CPTS0_TS_GENF	MCU_CPSW0 CPTS generator function event interrupt	Edge
	MCU_CPSW_SYNC_EVT	MCU_CPTS0_TS_SYNC	MCU_CPSW0 CPTS sync event interrupt	Edge

Note

For more information about interrupts, see *Local Interrupt Controller*.

For more information on the interconnects, see [Chapter 3](#).

For more information on the power, reset and clock management, see the corresponding sections within [Chapter 5](#).

For more information on the device interrupt controllers, see *Interrupt Controllers*.

9.4 MCU_CPSW0 Functional Description

The two-port switch Ethernet subsystem modules (CPSW) are compliant to the IEEE Std 802.3 Specification. CPSW top level functional block diagram is shown in [Figure 9-5](#).

9.4.1 Functional Block Diagram

The two-port Ethernet subsystem consists of:

- CPSW_2G
- One RGMII interface module
- One RMII interface module
- One Host Port 0 CPPI Packet Streaming Interface
- CPSW subsystem control registers (REG)
- One MDIO interface module
- One Interrupt Controller module

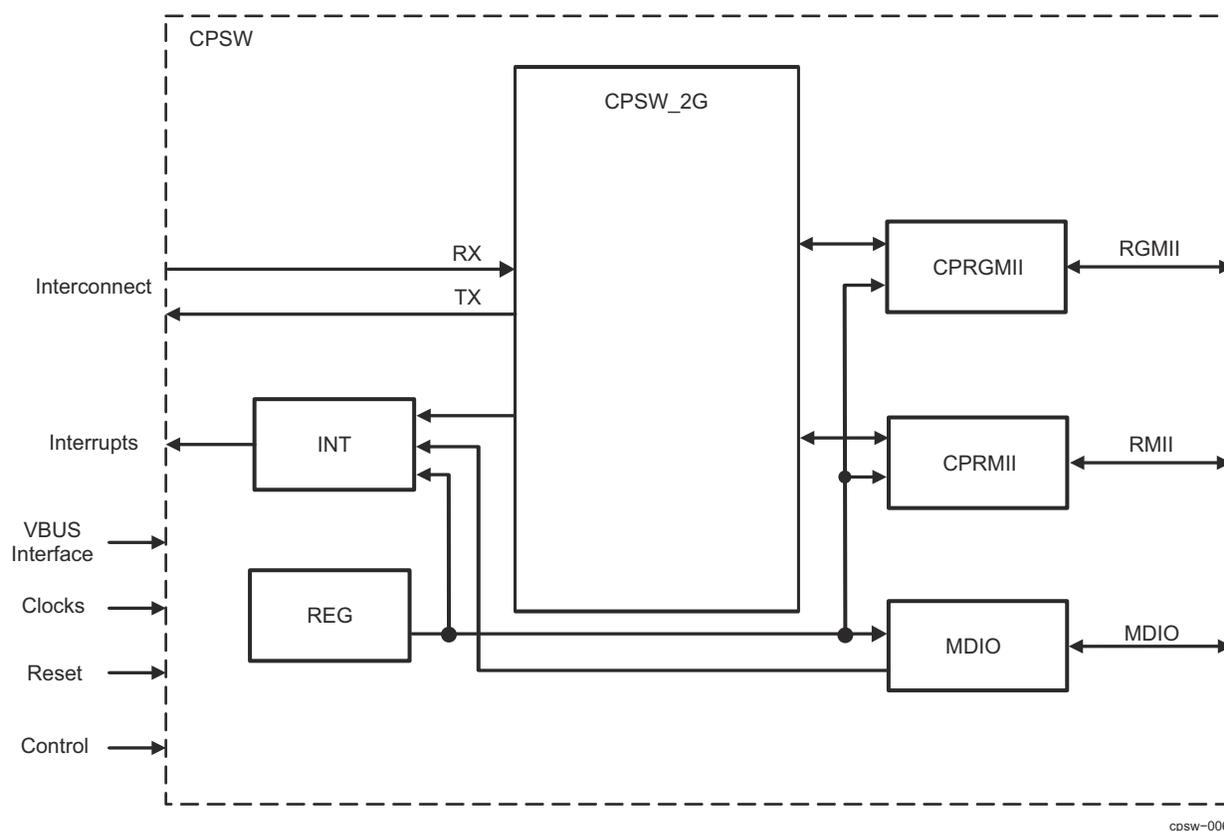

Figure 9-5. CPSW Top Level Block Diagram

9.4.2 CPSW Ports

The Ethernet Subsystem has two ports. Port 0 is the Host port (internal to the Subsystem). Port 1 is the external port connected to RGMII, or RMII interfaces as per the interface selected.

Naming conventions followed in this chapter:

- Port0 is referred to the CPPI CPDMA Host Port
- Port1 is referred to the interfaces RGMII/RMII

9.4.2.1 Ethernet Port Operation

9.4.2.1.1 Interface Mode Selection

The two-port switch (CPSW) Ethernet Subsystem has one 10/100/1000 Ethernet port with selectable MII, RMII, and RGMII interfaces. These interfaces can be enabled by **MSS_CTRL:CPSW_CONTROL:CPSW_CONTROL_PORT1_MODE_SEL**

For specific interface mode further features is selected by configuring the Ethernet bits (EXT_EN, GIG, FULLDUPLEX, IFCTL_A) in the **PN_MAC_CONTROL** register.

See the device-specific Datasheet for configuring the pin mux mode as per the interface selected.

CPSW_CONTROL_PORT1_MODE_SEL	Link Type
00	GMII/MII
01	RMII
10	RGMII

9.4.2.1.2 RMII Operation

The **IFCTL_A** bit determines the RMII link speed (0=10mbps, 1=100mbps). The **FULLDUPLEX** bit controls RMII duplexity. The **IFCTL_B** is not used.

9.4.2.1.3 RGMII Operation

Each port RGMII interface can operate in a forced mode or an in-band mode as determined by the **EXT_EN** bit. Forced mode is with **EXT_EN** cleared. In-band mode is with **EXT_EN** set.

9.4.2.1.3.1 RGMII In-Band Operation

A port CPRGMII is operating in the in-band mode of operation when the **EXT_EN** is set. The link status, duplexity, and speed are determined from the RGMII input data stream as defined in the RGMII specification and can be read in the **SS_RGMII1_STATUS** register. The link speed is indicated as shown in [Table 9-5](#).

Table 9-5. RGMII Link Speed

SPEED(1:0)	Link Speed
00	10 Mbs mode
01	100 Mbs mode
10	1000 Mbs mode
11	reserved

9.4.2.1.3.2 RGMII Forced Mode Operation

9.4.3 Clocking

9.4.3.1 Subsystem Clocking

CPSW clocking summary is shown in [Section 9.3, CPSW Integration](#).

9.4.3.2 Interface Clocking

Data is transmitted and received with respect to the reference clocks of the interface pins.

9.4.3.2.1 RGMII Interface Clocking

RGMII_RXC, RGMII_TXC frequencies are:

- 2.5 MHz at 10 Mbps
- 25 MHz at 100 Mbps

9.4.3.2.2 RMII Interface Clocking

RMII interface clock RMII_50MHZ_CLK frequency is:

- 50 MHz at 10 Mbps

- 50 MHz at 100 Mbps

CTRLMMR_MCU_CLKOUT0_CTRL[4]CLK_EN and CTRLMMR_MCU_CLKOUT0_CTRL[0]CLK_SEL bits are used to enable and select the clock source for MCU_CLKOUT pin.

9.4.3.2.3 MDIO Clocking

The MDIO clock is based on a divide-down of the interface (CPPI_ICLK) clock. The application software or driver must control the divide-down value.

See the CPSW_MDIO_CONTROL_REG register for configuring the Clock Divider ([15-0]CLKDIV) value.

9.4.4 Interrupt Functionality

Table 9-6. Interrupt Functionality

Interrupt	Description
MSS_CPSW_FH_INT	FHost (from host to Ethernet) interrupt
MSS_CPSW_TH_INT	THost (from Ethernet to host) interrupt
MSS_CPSW_TH_TRSH_INT	THost (from Ethernet to host) Threshold interrupt
MSS_CPSW_MISC_INT	Miscellaneous interrupt
MSS_CPSW_SERR	ECC SEC interrupt – output from CPSW ECC module. This interrupt is also included in the MSS_CPSW_MISC_INT if enabled or this interrupt can be used separately.
MSS_CPSW_UERR	ECC DED interrupt – output from CPSW ECC module. This interrupt is also included in the MSS_CPSW_MISC_INT if enabled or this interrupt can be used separately.

9.4.4.1 MSS_CPSW_TH_TRSH_INT Interrupt Description

The MSS_CPSW_TH_TRSH_INT interrupts are each an immediate (non-paced) pulse interrupt selected from the CPSW_2G TH_THRESH_PEND[7:0] interrupts. The THost threshold pending interrupt(s) is selected by setting one or more bits in the SS_TH_THRESH_PULSE_EN_REG[7:0] register. The masked interrupt status can be read in the SS_TH_THRESH_PULSE_STATUS_REG[7:0] register. Upon reception of an interrupt, software should perform the following:

- Read the SS_TH_THRESH_PULSE_STATUS_REG[7:0] register to determine which channel(s) caused the interrupt.
- Process THost packets in order to add more buffers to any channel that is below the threshold value.
- Write the CPSW_2G completion pointer(s) to acknowledge the CPDMA interrupt.
- Write 0x0 to the CPDMA_EOI_VECTOR register in the CPSW_2G slave address space to acknowledge the subsystem interrupt.

9.4.4.2 MSS_CPSW_TH_INT Interrupt Description

The MSS_CPSW_TH_INT interrupts are each a paced pulse interrupt selected from the CPSW_2G TH_PEND[7:0] interrupts. The THost pending interrupt(s) is selected by setting one or more bits in the SS_TH_PULSE_EN_REG[7:0] register. The masked interrupt status can be read in the SS_TH_PULSE_STATUS_REG[7:0] register. Upon reception of an interrupt, software should perform the following:

- Read the SS_TH_PULSE_STATUS_REG[7:0] register to determine which channel(s) caused the interrupt.
- Process THost packets for the interrupting channel(s) to acknowledge the CPDMA interrupt.
- Write the CPSW_2G completion pointer(s).
- Write 0x1 to the CPDMA_EOI_VECTOR_REG register in the CPSW_2G slave address space to acknowledge the subsystem interrupt.

9.4.4.3 MSS_CPSW_FH_INT Interrupt Description

The MSS_CPSW_FH_INT interrupts are each a pulse interrupt selected from the CPSW_2G FH_PEND[7:0] interrupts. The transmit pending interrupt(s) is selected by setting one or more bits in the SS_FH_PULSE_EN_REG[7:0] register. The masked interrupt status can be read in the

SS_FH_PULSE_STATUS_REG[7:0] register. Upon reception of an interrupt, software should perform the following:

- Read the **SS_FH_PULSE_STATUS_REG[7:0]** register to determine which channel(s) caused the interrupt.
- Process THost packets for the interrupting channel(s).
- Write the **CPSW_2G** completion pointer(s) to acknowledge the CPDMA interrupt.
- Write 0x2 to the **CPDMA_EOI_VECTOR_REG** register in the **CPSW_2G** slave address space to acknowledge the subsystem interrupt.

9.4.4.4 **MSS_CPSW_MISC_INT** Interrupt Description

The **MSS_CPSW_MISC_INT** interrupts are each an immediate (non-paced) pulse interrupt selected from the miscellaneous interrupts (**DED_PEND**, **SEC_PEND**, **EVNT_PEND**, **STAT_PEND**, **HOST_PEND**, **MDIO_LINKINT**, **MDIO_USERINT**). The miscellaneous interrupt bits are enabled by setting one or more bits in the **SS_MISC_EN_REG** register. The masked interrupt status can be read in the **SS_MISC_STATUS_REG** register. Upon reception of an interrupt, software should perform the following:

- Read the **SS_MISC_STATUS_REG** register to determine the cause of the interrupt.
 - **MDIO_USERINT** is the logical “OR” of the **CPSW_2G MDIO MDIO_USERINT[1:0]**.
 - **MDIO_LINKINT** is the logical “OR” of the **CPSW_2G MDIO MDIO_LINKINT[1:0]**
 - **HOST_PEND** is the **CPSW_2G CPDMA** host error interrupt.
 - **STAT_PEND** is the logical “OR” of the **CPSW_2G** statistics interrupt **STAT_PEND[2:0]**.
 - **EVNT_PEND** is the **CPSW_2G CPTS** event interrupt.
 - **SEC_PEND** is the ECC Single bit error interrupt.
 - **DED_PEND** is the ECC double bit error interrupt.
- Process the interrupt.
- Write 0x3 to the **CPDMA_EOI_VECTOR** register in the **CPSW_2G** slave address space to acknowledge the subsystem interrupt.

9.4.4.5 **ECC SEC ESM** Interrupt (**MSS_CPSW_SERR**)

ESM interrupt indicating a **CPSW_2G** ECC single error has been detected and corrected. Although the **MSS_CPSW_SERR** value can be read in the **CPDMA_IN_VECTOR** register, there is no EOI associated with this interrupt. It is a direct output of the **CPSW_2G** ECC aggregator module. MSS can enable this interrupt from **SS_MISC_EN_REG[5]** and read status from **SS_TH_PULSE_STATUS_REG[5]**

9.4.4.6 **ECC DED ESM** Interrupt (**MSS_CPSW_UERR**)

ESM interrupt indicating a **CPSW_2G** ECC double error has been detected. Although the **MSS_CPSW_UERR** value can be read in the **CPDMA_IN_VECTOR** register, there is no EOI associated with this interrupt. It is a direct output of the **CPSW_2G** ECC aggregator module. MSS can enable this interrupt from **SS_MISC_EN_REG[6]** and read status from **SS_MISC_STATUS_REG[6]**.

9.4.4.7 **THost Threshold** Interrupts for **CPDMA**

Each of the eight THost channels has a corresponding THost threshold interrupt (**TH_THRESH_PEND[7:0]**). The THost threshold interrupts are level interrupts that remain asserted until the triggering condition is cleared by the host. Each of the eight threshold interrupts may be individually enabled by setting to one the appropriate bit in the **CPDMA_TH_INTSTAT_SET** register. Each of the eight channel interrupts may be individually disabled by clearing to zero the appropriate bit in the **CPDMA_TH_INTSTAT_CLR** register. The raw and masked interrupt receive interrupt status may be read by reading the **CPDMA_TH_INTSTAT_RAW** and **CPDMA_TH_INTSTAT_MASKED** registers respectively. A **TH_THRESH_PEND[7:0]** interrupt bit is asserted when enabled and when the channel’s associated freebuffer count (**CPDMA_TH(0/7)_FREEBUFFER**) is less than or equal to the channel’s associated flow control threshold register (**CPDMA_TH(0/7)_PENDTHRESH**). The threshold interrupts are intended to give the host an indication that resources are running low for a particular channel(s).

9.4.4.8 Thost Packet Completion Interrupts for CPDMA

The THost DMA controller has eight channels with each channel having a corresponding interrupt (**TH_PEND[7:0]**). The THost interrupts are level interrupts that remain asserted until cleared by the host. Each of the eight channel interrupts may be individually enabled by setting to one the appropriate bit in the **CPDMA_TH_INTSTAT_SET** register. Each of the eight channel interrupts may be individually disabled by clearing to zero the appropriate bit in the **CPDMA_TH_INTSTAT_CLR** register. The raw and masked interrupt status may be read by reading the **CPDMA_TH_INTSTAT_RAW** and **CPDMA_TH_INTSTAT_MASKED** registers respectively. When a packet transfer is complete, the CPDMA issues an interrupt to the host by writing the packet's last buffer descriptor address to the appropriate channel queue's **CPDMA_TH(0..7)_CP** completion pointer. The interrupt is generated by the write, regardless of the value written. Upon interrupt reception, the host processes one or more packets from the queue and then acknowledges one or more interrupt(s) by writing the address of the last buffer descriptor processed to the queue's associated **CPDMA_TH(0..7)_CP** Completion Pointer. If the host written buffer address value is different from the buffer address written by the port, then the level interrupt remains asserted which means that the CPDMA has transferred more packets than the host has processed interrupts for. If the host written buffer address value is equal to the port written value then the host has processed all packets that the CPDMA has transferred and the level interrupt is deasserted. The CPDMA write to the completion pointer actually stores the value. The host written value is actually not written to the register location. The host written value is compared to the register contents which was written by the CPDMA. If the two values are equal then the interrupt is removed, otherwise the interrupt remains asserted. The host may process multiple packets previous to acknowledging an interrupt, or the host may acknowledge interrupts for every packet.

9.4.4.9 Fhost Packet Completion Interrupts for CPDMA

The FHost DMA controller has eight channels with each channel having a corresponding interrupt (**FH_PEND[7:0]**). The FHost interrupts are level interrupts that remain asserted until cleared by the host. Each of the eight channel interrupts may be individually enabled by setting to one the appropriate bit in the **CPDMA_FH_INTSTAT_MASKED_SET** register. Each of the eight channel interrupts may be individually disabled by clearing to zero the appropriate bit in the **CPDMA_FH_INTSTAT_MASKED_CLR** register. The raw and masked interrupt status may be read by reading the **CPDMA_FH_INTSTAT_RAW** and **CPDMA_FH_INTSTAT_MASKED** registers respectively. When each packet transfer is complete, the CPDMA issues an interrupt to the host by writing the packet's last buffer descriptor address to the appropriate channel **CPDMA_FH(0..7)_CP** completion pointer register. The interrupt is generated by the write, regardless of the value written. Upon interrupt reception, the host processes one or more packets from the queue and then acknowledges an interrupt by writing the address of the last buffer descriptor processed to the queue's associated Fhost Completion Pointer. If the host written buffer address value is different from the buffer address written by the port, then the level interrupt remains asserted which means that the CPDMA has transferred more packets than the host has processed interrupts for. If the host written buffer address value is equal to the port written value then the host has processed all packets that the CPDMA has transferred and the level interrupt is deasserted. The CPDMA write to the completion pointer actually stores the value. The host written value is actually not written to the register location. The host written value is compared to the register contents which was written by the CPDMA and if the two values are equal then the interrupt is removed, otherwise the interrupt remains asserted. The host may process multiple packets previous to acknowledging an interrupt, or the host may acknowledge interrupts for every packet.

9.4.5 Media Independent Interfaces (XGMII/GMII)

For the purposes of this document, Ethernet transmit is egress and Ethernet receive is ingress.

9.4.5.1 Receive Control

Data received from the PHY is interpreted and forwarded by the MAC into the switch. Interpretation involves detection and removal of the preamble and start of frame delimiter, extraction of the address and frame length, data handling, error checking and reporting, cyclic redundancy checking (CRC), and statistics control signal generation.

9.4.5.1.1 Receive Inter-Frame Interval

The 802.3 required inter-packet gap (IPG) is 24 GMII clocks (96 bit times) for 10/100 Mbit modes, and 12 GMII clocks (96 bit times) for 1000 Mbit mode. However, the MAC can tolerate a reduced IPG (2 GMII clocks in 10/100 mode and 5 GMII clocks in 1000 mode) with a correct preamble and start frame delimiter.

This interval between frames must comprise (in the following order):

1. An Inter-Packet Gap (IPG).
2. A seven octet preamble (all octets 0x55).
3. A one octet start frame delimiter (0x5d).

9.4.5.1.2 Received Frame Classification

Received frames are proper (good) frames if they are between 64 and **PN_RX_MAXLEN** in length (inclusive) and contain no errors (code/align/CRC).

Received frames are long frames if their frame count exceeds the value in the **PN_RX_MAXLEN** register. The **PN_RX_MAXLEN** register reset (default) value is 1518 (dec). Long received frames are either oversized or jabber frames. Long frames with no errors are oversized frames. Long frames with CRC, code, or alignment errors are jabber frames.

Received frames are short frames if their frame count is less than 64 bytes. Short frames that contain no errors are runt frames. Short frames with CRC, code, or alignment errors are fragment frames. If **RX_CSF_EN** in **PN_MAC_CONTROL** is set, undersized frames from 33 to 63 bytes will be forwarded only to the host on a best effort basis (meaning that the ALE may or may not be able to keep up with the packet rate and the short packet may be dropped due to bandwidth limitations). If **RX_CSF_EN** and **RX_CEF_EN** in **PN_MAC_CONTROL** are set, fragment frames from 33 to 63 bytes will also be forwarded only to the host on a best effort basis. Ethernet port received frames shorter than 33 bytes are dropped in all cases.

A received long packet will always contain **PN_RX_MAXLEN** number of bytes transferred to memory (if **RX_CEF_EN** = 1). Examples with **PN_RX_MAXLEN** = 1518 is below:

- If the frame length is 1518, then the packet is not a long packet and there will be 1518 bytes transferred to memory.
- If the frame length is 1519, there will be 1518 bytes transferred to memory. The last three bytes will be the first three CRC bytes.
- If the frame length is 1520, there will be 1518 bytes transferred to memory. The last two bytes will be the first two CRC bytes.
- If the frame length is 1521, there will be 1518 bytes transferred to memory. The last byte will be the first CRC byte.
- If the frame length is 1522, there will be 1518 bytes transferred to memory. The last byte will be the last data byte.

9.4.5.2 Transmit Control

A jam sequence is output if a collision is detected on a transmit packet in half-duplex mode. If the collision was late (after the first 64 bytes have been transmitted) then the collision is ignored. If the collision is not late, then the controller will back off before retrying the frame transmission. When operating in full duplex mode the carrier sense (CRS) and collision sensing modes are disabled.

9.4.5.2.1 Adaptive Performance Optimization (APO)

The Ethernet MAC port incorporates Adaptive Performance Optimization (APO) logic that may be enabled by setting the **TX_PACE** bit in the **PN_MAC_CONTROL** register. Transmission pacing to enhance performance is enabled when set. Adaptive performance pacing introduces delays into the normal transmission of frames, delaying transmission attempts between stations, reducing the probability of collisions occurring during heavy traffic (as indicated by frame deferrals and collisions) thereby increasing the chance of successful transmission.

When a frame is deferred, suffers a single collision, multiple collisions or excessive collisions, the pacing counter is loaded with an initial value of 31. When a frame is transmitted successfully (without experiencing a deferral, single collision, multiple collision or excessive collision) the pacing counter is decremented by one, down to zero.

With pacing enabled, a new frame is permitted to immediately (after one IPG) attempt transmission only if the pacing counter is zero. If the pacing counter is non-zero, the frame is delayed by the pacing delay, a delay of approximately four inter-packet gap delays. APO only affects the IPG preceding the first attempt at transmitting a frame. It does not affect the back-off algorithm for retransmitted frames.

9.4.5.2.2 Inter-Packet-Gap Enforcement

The measurement reference for the IPG of 96 bit times is changed depending on frame traffic conditions. If a frame is successfully transmitted without collision, and **MCRS** is de-asserted within approximately 48 bit times of **MTXEN** being de-asserted, then 96 bit times is measured from **MTXEN**. If the frame suffered a collision, or if **MCRS** is not de-asserted until more than approximately 48 bit times after **MTXEN** is de-asserted, then 96 bit times (approximately, but not less) is measured from **MCRS**.

The Ethernet port transmit inter-packet gap (IPG) may be shortened by eight bit times when short gap is enabled and triggered. Setting the **TX_SHORT_GAP_ENABLE** bit each **PN_MAC_CONTROL** register enables the gap to be shortened when triggered. The condition is triggered when the ports associated transmit packet FIFO has a user defined number of FIFO blocks used. The associated transmit FIFO blocks used value determines if the gap is shortened, and so on. The **GAP_THRESH** register value determines the short gap threshold. If the FIFO blocks used is greater than or equal to the **GAP_THRESH** value then short gap is triggered.

9.4.5.2.3 Programmable Transmit Inter-Packet Gap

The transmit inter-packet gap (IPG) is programmable through the **PN_MAC_TX_GAP** register. The default value is decimal 12. The transmit IPG may be increased to the maximum value of 0x1ff. Increasing the IPG is not compatible with transmit pacing. The short gap feature will override the increased gap value, so the short gap feature may not be compatible with an increased IPG.

9.4.5.2.4 Back Off

The Ethernet Mac implements the 802.3 binary exponential back-off algorithm for half-duplex based collisions.

9.4.5.3 Emulation Control

The emulation control input (**TBEMUSUP**) and register bits (**SOFT** and **FREE** in the **PN_MAC_EMCONTROL** register) allow Mac operation to be suspended. When the emulation suspend state is entered, the MAC will stop processing receive and transmit frames at the next frame boundary. Any frame currently in reception or transmission will be completed normally without suspension. For receive, frames that are detected by the MAC after the suspend state is entered are ignored. Emulation control is implemented for compatibility with other peripherals. [Table 9-7](#) shows the operations of emulation control input and register bits.

Table 9-7. Emulation Control Input and Register Bits

TBEMUSUP	SOFT	FREE	Description
0	X	X	Normal Operation
1	0	0	Normal Operation
1	1	0	Emulation Suspend
1	X	1	Normal Operation

9.4.5.4 Command IDLE

The **CMD_IDLE** bit in the **PN_MAC_CONTROL** register allows MAC operation to be suspended by software. When the idle state is commanded, the MAC will stop processing receive and transmit frames at the next frame boundary. Any frame currently in reception or transmission will be completed normally without suspension. Received frames that are detected after the suspend state is entered are ignored (dropped without any processing or statistics). Commanded idle is similar in operation to emulation control and hardware clock stop.

9.4.6 Software IDLE

The submodule software idle register bits enable CPSW operation to be completely or partially suspended by software control. There are two CPSW submodules that contain software idle register bits. Each of the two submodules may be individually commanded to enter the idle state. The idle state is entered at packet boundaries, and no further packet operations will occur on an idled submodule until the idle command is removed. The CPSW module enters the idle state when all two submodules are commanded to enter and have entered the idle state. Idle status is determined by reading or polling the two submodule idle bits. The CPSW_2G is in the idle state when all two submodules are in the idle state. The CPSW_SOFT_IDLE_REG[0] SOFT_IDLE bit may be set if desired after the submodules are in the idle state. The SOFT_IDLE bit causes packets to not be transferred from one FIFO to another FIFO internal to the switch.

9.4.7 CPSW_2G

The CPSW_2G RMII/ RGMII interface is compliant to the IEEE Std 802.3 Specification.

The CPSW_2G contains one Ethernet port interface (Ethernet port 1), one CPPI packet streaming interface host port (port 0), Common Platform Time Sync (CPTS), ALE Engine and Statistics (STATS). A top-level block diagram of the CPSW_2G is shown in Figure 9-6.

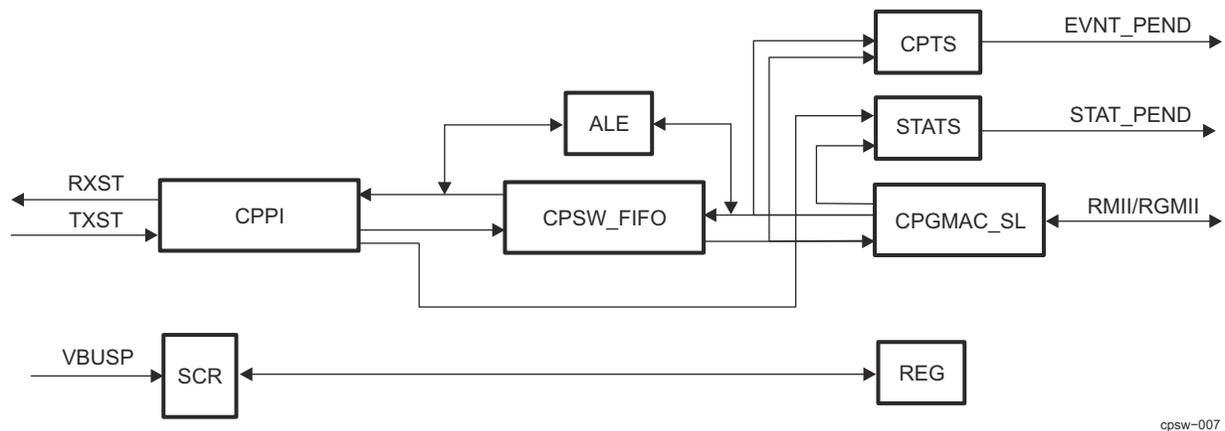

Figure 9-6. CPSW_2G Block Diagram

9.4.7.1 Address Lookup Engine (ALE)

The Address Lookup Engine (ALE) is a sub-block of the CPSW Switch and it processes all received packets and determines to which port(s) the packet should be forwarded. The ALE uses the incoming packet received port number, destination address, source address, length/type, and VLAN information to determine how the packet should be forwarded. The ALE outputs the port mask to the switch fabric that indicates the port(s) the packet should be forwarded to. The ALE is enabled when the ENABLE bit in the ALE_CONTROL_REG register is set. All packets are dropped when the ENABLE bit is cleared to 0.

9.4.7.1.1 Error Handling

In normal operation, the Ethernet port is configured to issue an abort, instead of an end of packet, at the end of a packet that contains an error (runt, frag, oversize, jabber, crc, alignment, code etc.) or at the end of a MAC control packet. However, when the PN_MAC_CONTROL_REG configuration bit(s) RX_CEF_EN, RX_CSF_EN, or RX_CMF_EN are set, error frames, short frames or MAC control frames have a normal end of packet instead of an abort at the end of the packet. When the ALE receives a packet that contains errors (due to a set header error bit), or a MAC control frame and does not receive an abort, the packet will be forwarded only to the host port (port 0). Packets with errors that are forwarded to the host have no VLAN untagging or drop due to rate limiting. No ALE learning occurs on packets with errors or mac control frames. Learning is based on source address and lookup is based on destination address. Directed packets from the host are not learned, updated, or touched.

9.4.7.1.2 Bypass Operations

The ALE may be configured to operate in bypass mode by setting the BYPASS bit in the ALE_CONTROL_REG register. When in bypass mode, all Ethernet port received packets are forwarded only to the host port (port 0). In bypass mode, the ALE processes host port transmit packets the same as in normal mode. In general, packets would be directed by the host in bypass mode.

9.4.7.1.3 OUI Deny or Accept

The ALE may be configured to operate in OUI deny mode by setting the enable_oui_deny bit in the ALE_CONTROL register. When in OUI deny mode, any packet with a non-matching OUI source address will be dropped to the host unless the packet destination address matches with a supervisory table entry. (Non-matching OUI source address broadcast/multicast packets will be dropped to the host unless the packet destination address is entered into the table with the super bit set. Non-matching OUI source address unicast packets will be dropped to the host unless the unicast destination address is in the table with block and Secure both set). When enable_oui_deny is cleared, any packet source address matching an OUI address table entry will be dropped to the host unless the destination address matches with a supervisory address table entry. (Broadcast packets matching the OUI source address will be dropped to the host unless the broadcast destination address is entered into the table with the super bit set. Unicast packets matching the OUI source address will be dropped to the host unless the unicast destination address is in the table with block and Secure both set)

9.4.7.1.4 Statistics Counting

ALE sends many statistics along with the frame routing so the CPSW can count them on a per port basis. The events specified through the CPSW_ALE_STAT_DIAG[3-0] STAT_DIAG field are individually counted in CPSW per port statistics counters.

9.4.7.1.5 Supervisory packets

Multicast supervisory packets are designated by the SUPER bit in the table entry. Unicast supervisory packets are indicated when BLOCK and SECURE are both set. Supervisory packets are not dropped due to rate limiting, OUI, or VLAN processing. The purpose of supervisory packets is to allow packets that would be otherwise blocked to be forwarded for special purposes.

9.4.7.1.6 ALE Lookup Table Entry Definitions

The ALE table contains multiple table entry types. Each table entry represents a free entry, an address, a VLAN, an address/VLAN pair, or an OUI address. Software should ensure that there are not double address entries in the table. The double entry used would be indeterminate. Reserved table bits must be written with zeroes.

Source Address learning occurs for packets with a unicast, multicast or broadcast destination address and a unicast or multicast (including broadcast) source address. Multicast source addresses have the group bit (bit 40) cleared before ALE processing begins, changing the multicast source address to a unicast source address. A multicast address of all ones is the broadcast address which may be added to the table. A learned unicast source address is added to the table with the following control bits:

Table 9-8. Learned Address Control Bits

Bit(s)	Value
Ageable	1
Touch	1
BLOCK	0
SECURE	0

If a received packet has a source address that is equal to the destination address then the following occurs:

- The address is learned if the address is not found in the table.
- The address is updated if the address is found.
- The packet is dropped.

Table Entry Type

00 - Free Entry

01 - Address Entry : unicast or multicast determined by destination **address bit 40**. (1:Multicast, 0:Unicast)

10 - VLAN entry

11 - VLAN Address Entry : unicast or multicast determined by **address bit 40**.(1:Multicast, 0:Unicast)

9.4.7.1.6.1 Free Table Entry

Table 9-9. Free (Unused) Address Table Entry Bit Values

70:62	61:60	59:0
Reserved	ENTRY_TYPE (00)	Reserved

9.4.7.1.6.2 Multicast Address Table Entry (Bit 40==1)

Table 9-10. Multicast Address Table Entry Bit Values

70:68	67:66	65	64	63:62	61:60	59:48	47:0
Reserved	PORT_MASK	SUPER	IgnoreMbits	MCAST_FWD_STATE	ENTRY_TYPE (01)	Reserved	MULTICAST_ADDRESS

IgnoreMbits

Ignore Multicast Bits - Indication that the Multicast Address has ignored bits.

Supervisory Packet (SUPER)

When set, this field indicates that the packet with a matching multicast destination address is a supervisory packet.

0: Non-supervisory packet

1: Supervisory packet

Port Mask(1:0) (PORT_MASK)

This 2-bit field is the port bit mask that is returned with a found multicast destination address. There may be multiple bits set indicating that the multicast packet may be forwarded to multiple ports (but not the receiving port).

Multicast Forward State (MCAST_FWD_STATE)

Indicates the port state(s) required for the received port on a destination address lookup in order for the multicast packet to be forwarded to the transmit port(s). A transmit port must be in the Forwarding state in order to forward the packet. If the transmit PORT_MASK has multiple set bits then each forward decision is independent of the other transmit port(s) forward decision.

00 - Forwarding

01 - Blocking/Forwarding/Learning

10 - Forwarding/Learning

11 - Forwarding

The forward state test returns a true value if both the RX and TX ports are in the required state.

Table Entry Type (ENTRY_TYPE)

Address entry type. Unicast or multicast determined by address bit 40.

01: Address entry. Unicast or multicast determined by address bit 40.

Packet Address (MULTICAST_ADDRESS)

This is the 48-bit packet MAC address. For an OUI address, only the upper 24-bits of the address are used in the source or destination address lookup. Otherwise, all 48-bits are used in the lookup.

9.4.7.1.6.3 VLAN/Multicast Address Table Entry (Bit 40==1)

Table 9-11. VLAN/Multicast Address Table Entry Bit Values

70:68	67:66	65	64	63:62	61:60	59:48	47:0
Reserved	PORT_MASK	SUPER	Reserved	MCAST_FWD_STATE	ENTRY_TYPE (11)	VLAN_ID	MULTICAST_ADDRESS

Supervisory Packet (SUPER)

When set, this field indicates that the packet with a matching multicast destination address is a supervisory packet.

0: Non-supervisory packet

1: Supervisory packet

Port Mask(1:0) (PORT_MASK)

This 2-bit field is the port bit mask that is returned with a found multicast destination address. There may be multiple bits set indicating that the multicast packet may be forwarded to multiple ports (but not the receiving port).

Multicast Forward State (MCAST_FWD_STATE)

Indicates the port state(s) required for the received port on a destination address lookup in order for the multicast packet to be forwarded to the transmit port(s). A transmit port must be in the Forwarding state in order to forward the packet. If the transmit PORT_MASK has multiple set bits then each forward decision is independent of the other transmit port(s) forward decision.

00 - Forwarding

01 - Blocking/Forwarding/Learning

10 - Forwarding/Learning

11 - Forwarding

The forward state test returns a true value if both the RX and TX ports are in the required state.

Table Entry Type (ENTRY_TYPE)

Address entry type. Unicast or multicast determined by address bit 40.

11: VLAN address entry. Unicast or multicast determined by address bit 40.

VLAN ID (VLAN_ID)

The unique identifier for VLAN identification. This is the 12-bit VLAN ID.

Packet Address (MULTICAST_ADDRESS)

This is the 48-bit packet MAC address. For an OUI address, only the upper 24-bits of the address are used in the source or destination address lookup. Otherwise, all 48-bits are used in the lookup.

9.4.7.1.6.4 Unicast Address Table Entry (Bit 40==0)

Table 9-12. Unicast Address Table Entry Bit Values

70:68	67	66	65	64	63:62	61:60	59:48	47:0

Table 9-12. Unicast Address Table Entry Bit Values (continued)

Reserved	TRUNK	PORT_NUMBER	BLOCK	SECURE	UNICAST_TYP E (00) or (X1)	ENTRY_TYPE (01)	Reserved	UNICAST_AD DRESS
----------	-------	-------------	-------	--------	----------------------------------	--------------------	----------	---------------------

Trunk

Trunk Indicator -

0 - the port bits in the entry are the port number

1 - the port bits in the entry are the trunk number

Port Number (PORT_NUMBER)

This field indicates the port number (not port mask) that the packet with a unicast destination address may be forwarded to. Packets with unicast destination addresses are forwarded only to a single port (but not the receiving port).

Block (BLOCK)

The block bit indicates that a packet with a matching source or destination address should be dropped (block the address).

0 - Address is not blocked.

1 - Drop a packet with a matching source or destination address (secure must be zero)

If block and secure are both set, then they no longer mean block and secure. When both are set, the block and secure bits indicate that the packet is a unicast supervisory (super) packet and they determine the unicast forward state test criteria. If both bits are set then the packet is forwarded if the receive port is in the Forwarding/Blocking/Learning state. If both bits are not set then the packet is forwarded if the receive port is in the Forwarding state.

Secure (SECURE)

This bit indicates that a packet with a matching source address should be dropped if the received port number is not equal to the table entry port_number.

0 - Received port number is a don't care.

1 - Drop the packet if the received port is not the secure port for the source address and do not update the address (block must be zero)

Unicast Type (UNICAST_TYPE)

This field indicates the type of unicast address the table entry contains.

00 - Unicast address that is not ageable.

01 - Ageable unicast address that has not been touched.

10 - OUI address - lower 24-bits are don't cares (not ageable).

11 - Ageable unicast address that has been touched.

Table Entry Type (ENTRY_TYPE)

Address entry. Unicast or multicast determined by address bit 40.

01: Address entry. Unicast or multicast determined by address bit 40.

Packet Address (UNICAST_ADDRESS)

This is the 48-bit packet MAC address. All 48-bits are used in the lookup.

9.4.7.1.6.5 OUI Unicast Address Table Entry

Table 9-13. OUI Unicast Address Table Entry Bit Values

70:64	63:62	61:60	59:48	47:24	23:0
Reserved	UNICAST_TYPE (10)	ENTRY_TYPE (01)	Reserved	UNICAST_OUI	Reserved

Unicast Type (UNICAST_TYPE)

This field indicates the type of unicast address the table entry contains.

- 00 - Unicast address that is not ageable.
- 01 - Ageable unicast address that has not been touched.
- 10 - OUI address - lower 24-bits are don't cares (not ageable).
- 11 - Ageable unicast address that has been touched.

Table Entry Type (ENTRY_TYPE)

Address entry. Unicast or multicast determined by address bit 40.

01: Address entry. Unicast or multicast determined by address bit 40.

Packet Address (UNICAST_OUI)

For an OUI address, only the upper 24-bits of the address are used in the source or destination address lookup.

9.4.7.1.6.6 VLAN/Unicast Address Table Entry (Bit 40==0)

Table 9-14. Unicast Address Table Entry Bit Values

70:68	67	66	65	64	63:62	61:60	59:48	47:0
Reserved	TRUNK	PORT_NUMBER	BLOCK	SECURE	UNICAST_TYPE (00) or (X1)	ENTRY_TYPE (11)	VLAN_ID	UNICAST_ADDRESS

Trunk

Trunk Indicator -

- 0 - the port bits in the entry are the port number
- 1 - the port bits in the entry are the trunk number

Port Number (PORT_NUMBER)

This field indicates the port number (not port mask) that the packet with a unicast destination address may be forwarded to. Packets with unicast destination addresses are forwarded only to a single port (but not the receiving port).]

Block (BLOCK)

The block bit indicates that a packet with a matching source or destination address should be dropped (block the address).

- 0 - Address is not blocked.
- 1 - Drop a packet with a matching source or destination address (secure must be zero)

If block and secure are both set, then they no longer mean block and secure. When both are set, the block and secure bits indicate that the packet is a unicast supervisory (super) packet and they determine the unicast forward state test criteria. If both bits are set then the packet is forwarded if the receive port is in the Forwarding/Blocking/Learning state. If both bits are not set then the packet is forwarded if the receive port is in the Forwarding state.

Secure (SECURE)

This bit indicates that a packet with a matching source address should be dropped if the received port number is not equal to the table entry PORT_NUMBER.

0 - Received port number is a don't care.

1 - Drop the packet if the received port is not the secure port for the source address and do not update the address (block must be zero)

Unicast Type (UNICAST_TYPE)

This field indicates the type of unicast address the table entry contains.

00 - Unicast address that is not ageable.

01 - Ageable unicast address that has not been touched.

10 - OUI address - lower 24-bits are don't cares (not ageable).

11 - Ageable unicast address that has been touched.

Table Entry Type (ENTRY_TYPE)

Address entry. Unicast or multicast determined by address bit 40.

11: VLAN address entry. Unicast or multicast determined by address bit 40.

VLAN ID (VLAN_ID)

The unique identifier for VLAN identification. This is the 12-bit VLAN ID.

Packet Address (UNICAST_ADDRESS)

This is the 48-bit packet MAC address. All 48-bits are used in the lookup.

9.4.7.1.6.7 VLAN Table Entry

Table 9-15. Inner VLAN Table Entry

70:68	67:66	65	64:62	61:60	59:48	47	46:44	43	42:26	25:24	23	22:20	19	18:2	1:0

Table 9-16. Outer VLAN Table Entry

70:68	67:66	65	64:62	61:60	59:48	47	46:44	43	42:26	25:24	23	22:20	19	18:2	1:0
Resvd	NoLrnMsk	IngressChk	010	10	oVLANI D	Resvd	RegIdx	NoFra g	Reserv ed	fwduta g	Reserve d	UregIdx	LmtNxtHdr	Reserv ed	Member

Member

VLAN Member list - This field indicates which port(s) are a member of the associated VLAN.

LmtNxtHdr

VLAN Limit Next Header Control - Causes frames to be dropped if the Protocol/Nxt Header does not match the ALE_NXT_HDR register values

UregIdx

VLAN Unregister Multicast Index - Index into VLAN_Mask_Mux register array that is used to create the unregistered multicast flood mask.

fwdutag

VLAN Forward Untagged Egress - Causes the packet VLAN tag to be removed on egress for the specified port(s).

NoFrag

LAN No IPv4 Fragmented frames Control - Causes IPv4 fragmented IP frames to be dropped.

RegIdx

VLAN Registered Multicast Index - Index into VLAN_Mask_Mux register array that is used to create the registered multicast flood mask.

iVLANID

Inner VLAN ID - This is the 12-bit Inner VLAN ID, normally referred to as C-VLANID

oVLANID

Outer VLAN ID - This is the 12-bit Outer VLAN ID, normally referred to as S-VLANID

IngressChk

VLAN Ingress Check - When set, if the receive port is not a member of this VLAN then the packet is dropped. This is similar to the vid_ingress_check bit in the ale_port_control register except this check is for this VLAN only (not all VLANs).

NoLrnMsk

VLAN No Learn Mask - When a bit is set in this mask, a packet with an unknown source address received on the associated port will not be learned (i.e. When a VLAN packet is received and the source address is not in the table, the source address will not be added to the table).

Table 9-17. IPv4 Table Entry

70	69:65	64:62	61:60	59:32	31:0
Resvd	IgnBits	110	10	Reserved	IPv4Adr

Table 9-18. IPv6 Table Entry High

70:64	63	62	61:60	59:0
IgnBits	Resvd	1	10	IPv6Adr[127:68]

Table 9-19. IPv6 Table Entry Low

70:63	62	61:60	59:0
IPv6Adr[67:60]	1	10	IPv6Adr[59:0]

IgnBits

Inore Bits - Indicates the number of lower address bits (IPv4 or IPv6) to be ignored starting at bit zero. Ignored bits must be zero value in the table entry

9.4.7.1.7 ALE Policing and Classification

The ALE has a number of configurable policer engines. Each policer engine can be used for classification and or policing. Policing is an extension of the classifier function that allows for color marking and rate limiting due to classifier bandwidth measurement thresholds. Any policer engine can be used for classification alone by not using the bandwidth limiting thresholds. The policers_div_8 field in the ALE_Status register indicates the number of policers available to be used for classification or policing.

Each policer can be enabled to match on one or more of any of the below packet fields for classification. All but Port and Priority are index references to the ALE table entries.

ALE Policing

The policing function on each policer engine is implemented as dual-counter three-color marking engine as described in the IETF RFC2698. The first counter is the committed information rate (CIR) counter and the

second counter is the peak information rate (PIR) counter. The policing function can use either or both counters. Based on the counter values the packet color is determined. The color is used to determine whether the packet is dropped or forwarded. The ALE has a local feature that can drop packets regardless of queue state.

The policing rates are determined by the below equations:

CIR policing rate in Mbit/s = ((ALE frequency in Mhz) * cir_idle_inc_val) / 32768

PIR policing rate in Mbit/s = ((ALE frequency in Mhz) * pir_idle_inc_val) / 32768

Each policer has 10 different match operations (see below Classification). Since multiple policing entries can be hit on a single packet this provides the ability to create precise traffic stream control.

9.4.7.1.7.1 ALE Classification

Each policer can be enabled to classify on one or more of any of the below packet fields for classification or policing. All but Port and Priority are index references to the ALE table entries.

- Port or Trunk Group Number
- Priority extracted from VLAN, mapped from DSCP if enabled or Default Port Priority
- Organization Network Unique identifier - ONU
- Destination Address - DA
- Source Address - SA
- Outer VLANID - S-VLANID
- Inner VLANID - C-VLANID
- Ether Type
- IP Source Address - IPSA with full CIDR masking for IPv4 and IPv6
- IP Destination Address - IPSA with full CIDR masking for IPv4 and IPv6

Multiple classifiers can match on a single packet. For example a classifier can be enabled to match on priority while another classifier could match on IP address. The ALE will return to the switch the highest classifier entries thread ID that matched with an enabled thread ID number. This could be used to further host routing of the packet.

9.4.7.1.7.1.1 Classifier to CPPI Transmit Flow ID Mapping

The ALE can generate a 6-bit transmit CPPI Flow ID based on classifier matches that can be used instead of the switch default transmit Flow ID mapping. The switch default flow ID is the remapped received packet priority (0 to 7). Thread and flow ID are used interchangeably for this since there is a single hardware thread (TXST_THREAD_MREADY) but there are 6-bits of FLOW_ID in the transmit CPPI INFO word 0. When enabled, the highest classifier match can map to a particular 6-bit flow ID value that is associated with the classifier. The ALE also supports an optional ALE default thread/flow ID value in the event that no classifiers match. Each thread/flow ID, including the ALE default thread/flow ID, has an enable such that the ALE default thread/Flow ID is used if enabled and if no matches occur (instead of the remapped received packet priority). If the ALE default is not enabled and no matches occur then the switch default value will be used. If multiple classifier matches occur, the highest match with a thread enable bit set will be used. The resultant flow ID has the CPSW_P0_FLOW_ID_OFFSET_REG register value added to it to determine the actual value in the INFO 0 Flow ID field.

Three registers are used for ALE classification thread/flow ID mapping configuration (CPSW_ALE_THREAD_DEF_REG, CPSW_ALE_THREAD_CTL_REG and CPSW_ALE_THREAD_VAL_REG). The three thread mapping registers are used independently and are separate from the other ALE policing registers. The CPSW_ALE_THREAD_CTL_REG register allows the CPSW_ALE_THREAD_VAL_REG register contents to be written to the selected classifier. There is a single CPSW_ALE_THREAD_DEF_REG that is used for all classifiers. The thread mapping registers can be written or changed at any time but any packets that are already processed will not have their thread altered.

9.4.7.1.8 Mirroring

The ALE supports three mirroring modes: destination port, source port and or table entry.

Destination port mirroring allows packets from any ingress port or trunk which ends up switching to a particular egress destination port or trunk to be mirrored to yet another egress destination port or trunk. For example any traffic from any port that is switched to port 'A' can be also mirrored to port 'B'. (MIRROR_DP=A, MIRROR_DEN=1h, MIRROR_TOP=B in the ALE_CONTROL register).

Source port mirroring allows packets received on any enabled ingress source port or trunk to be switched to the mirror egress port as well as the actual egress destination ports. For example traffic received on ingress port 'A' can be switched to egress port 'B' as well as the intended egress destination port.(MIRROR_SP=1h in the ALE_PORTn_CONTROL register, MIRROR_SEN=1h, MIRROR_TOP=B in the ALE_CONTROL register).

Table entry mirroring allows for any MAC Address, MAC Address with VLAN, ONU Address or VLAN entry that matches on ingress to be switched to the egress destination as well as the actual egress destination. For example all traffic for VLAN ID of 35 can be mirrored to port 'B'. That is any traffic switched on VLAN ID of 35 will be mirrored. ({VLAN ID of 35 in ALE Table entry index=C}, MIRROR_MIDX=C, MIRROR_MEN=1h, MIRROR_TOP=B)

In the event that mirrored packets are mirrored to or from a port that is also the mirror port the packet will not be duplicated or marked as a mirror packet since the packet has already been on the port as ingress or egress. The packet sent to the mirror port may have modified VLAN info based on the port and VLAN lookup table entries. The mirror port need not be a member of the VLAN ID it is mirroring, the ALE will forward traffic to the mirror port after ingress and egress filters are applied.

The switch may decide to drop any mirror traffic based on switch buffer thresholds as to prevent required traffic from becoming congested.

Port mirroring is controlled by register fields in ALE_CONTROL, ALE_CONTROL2 and the port control registers.

- MIRROR_DP - The destination port that will have its traffic mirrored (ALE_CONTROL_REG register).
- MIRROR_TOP - The port to which mirrored traffic is sent (ALE_CONTROL_REG register).
- MIRROR_MEN - The enable for mirroring traffic that matches a supported lookup table entry (ALE_CONTROL_REG register).
- MIRROR_DEN - The Enable for destination port mirroring (ALE_CONTROL_REG register).
- MIRROR_SEN - The Enable for source port mirroring (ALE_CONTROL_REG register).
- MIRROR_MIDX - The index of a lookup table entry that will be mirrored ALE_CONTROL2_REG register).
- Px_MIRROR_SP - The enable for the Source port to be mirrored. Although multiple source ports can be mirrored concurrently, a mirror traffic bandwidth issue may occur on the mirror egress port (ALE_PORTn_CONTROL register).

9.4.7.1.9 Trunking

The ALE supports port trunking of any port in any of four trunk groups. That is, four trunk groups can be supported with up to eight ports in each trunk group. There are no port adjacency rules for trunk groups. When ports are a member of a trunk group, addresses added and used in the lookup table will refer to the trunk group rather than port as indicated in the lookup table entries. If ports are removed from a trunk group, the ALE will redistribute the traffic based on the crc polynomial of enabled fields and the remaining ports within the trunk group. A trunk group may contain only one port. Packet priority, DA, SA, C-VLAN ID, IPv4SA, IPv4DA, IPv6SA, and/or IPv6DA can be used in the hash to generate destination port within the trunk group. If all hash enables are disabled, the packet can be directed to a particular port within the trunk group which allows for testing paths etc. A host directed frame is directed to the directed port regardless of trunk group settings.

Trunking is controlled through fields in the ALE_CONTROL2_REG register and in each ALE_ALE_PORTn_CONTROL_REG register:

- TRK_EN_DST - Enable destination address hashing for trunk port calculation.
- TRK_EN_SRC - Enable source address hashing for trunk port calculation.
- TRK_EN_PRI - Enable priority hashing for trunk port calculation.
- TRK_EN_VLAN - Enable inner C-VLAN ID hashing for trunk port calculation.
- TRK_EN_SIP - Enable source IP address hashing for trunk port calculation.
- TRK_EN_DIP - Enable destination IP address hashing for trunk port calculation.

- TRK_BASE - Hashing formula starting value and test port offset.
- TRUNK_EN - Enable this port as a trunk group
- TRUNK_NUMBER - Trunk group number defines this port as a member of a particular trunk group.

9.4.7.1.10 DSCP

The ALE can map DSCP field to priority prior to classification matching. When enabled the DSCP is mapped via 64 priority entries such that any DSCP value can be mapped to any of the eight priorities. When a packet is received without a VLAN priority this remapped priority can be used instead of the default Port VLAN priority field. See P0_RX_DSCP_MAP_REG and PN_RX_DSCP_MAP_REG registers in the Register Manual section for DSCP mapping.

9.4.7.1.11 Packet Forwarding Processes

There are four processes that an incoming received packet may go through to determine packet forwarding. The processes are *Ingress Filtering*, *VLAN_Aware Lookup*, *VLAN_Unaware Lookup*, and *Egress*.

Packet processing begins in the Ingress Filtering process. Each port has an associated packet forwarding state that can be one of four values (Disabled, Blocked, Learning, or Forwarding). The default state for all ports is Disabled. The host sets the packet forwarding state for each port.

In the packet ingress process (receive packet process), there is a forward state test for unicast destination addresses and a forward state test for multicast addresses. The multicast forward state test indicates the port states required for the receiving port in order for the multicast packet to be forwarded to the transmit port(s). A transmit port must be in the Forwarding state for the packet to be forwarded for transmission. The MCAST_FWD_STATE indicates the required port state for the receiving port as indicated in the preceding table. The unicast forward state test indicates the port state required for the receiving port in order to forward the unicast packet. The transmit port must be in the Forwarding state in order to forward the packet. The BLOCK and SECURE bits determine the unicast forward state test criteria. If both bits are set then the packet is forwarded if the receive port is in the Forwarding/Blocking/Learning state. If both bits are not set then the packet is forwarded if the receive port is in the Forwarding state. The transmit port must be in the Forwarding state regardless. The forward state test used in the ingress process is determined by the destination address packet type (multicast/unicast).

In general, packets received with errors are dropped by the address lookup engine without learning, updating, or touching the address. The error condition and the abort are indicated by the Ethernet port to the ALE. Packets with errors may be passed to the host (not aborted) by a Ethernet port, if the port has the RX_CMF_EN, RX_CEF_EN, or RX_CSF_EN bit(s) set in the CPSW_PN_MAC_CONTROL_REG register. Error packets that are passed to the host by the Ethernet port are considered to be bypass packets by the ALE and are sent only to the host. Error packets do not learn, update, or touch addresses regardless of whether they are aborted or sent to the host. Packets with long or short errors received by the host are dropped. Packets with errors received by the host are forwarded as normal.

The following control bits are in the CPSW PN_MAC_CONTROL_REG register:

- [22] RX_CEF_EN - enables frames that are fragments, long, jabber, CRC, code, and alignment errors to be forwarded
- [23] RX_CSF_EN - enables short frames to be forwarded
- [24] RX_CMF_EN - enables MAC control frames to be forwarded.

9.4.7.1.11.1 Ingress Filtering Process

Condition and action
If ((ALE BYPASS) and (host port is not the receive port)) then use host portmask and go to Egress process
if (directed packet) then use directed port number and go to Egress process
If (Rx PORT_STATE is Disabled) then discard the packet

if ((ALE_BYPASS or error packet) and (host port is not the receive port)) then use host portmask and go to Egress process
if (((BLOCK) and (unicast source address found)) or ((BLOCK) and (unicast destination address found))) then discard the packet
if ((ENABLE_RATE_LIMIT) and (rate limit exceeded) and (not RATE_LIMIT_TX)) then if (((Multicast/Broadcast destination address found) and (not SUPER)) or (Multicast/Broadcast destination address not found)) then discard the packet
if ((not forward state test valid) and (destination address found)) then discard the packet to any port not meeting the requirements <ul style="list-style-type: none"> Unicast destination addresses use the unicast forward state test and multicast destination addresses use the multicast forward state test.
if ((destination address not found) and ((not transmit port forwarding) or (not receive port forwarding))) then discard the packet to any ports not meeting the above requirements
if (source address found) and (secure) and (not block) and (receive port number != port_number)) then discard the packet
if ((not super) and (drop_untagged) and ((non-tagged packet) or ((priority tagged) and not(en_vid0_mode)))) then discard the packet
If (VLAN_Unaware) CPSW_ALE_FORCE_UNTAGGED_EGRESS_REG = "000000" CPSW_ALE_UNKNOWN_MCAST_FLOOD_REG = "111111" CPSW_ALE_UNKNOWN_REG_MCAST_FLOOD_REG = "111111" VLAN_MEMBER_LIST = "111111" else if (VLAN not found) CPSW_ALE_FORCE_UNTAGGED_EGRESS_REG = CPSW_ALE_FORCE_UNTAGGED_EGRESS_REG CPSW_ALE_UNKNOWN_MCAST_FLOOD_REG = CPSW_ALE_UNKNOWN_REG_MCAST_FLOOD_REG CPSW_ALE_UNKNOWN_REG_MCAST_FLOOD_REG = CPSW_ALE_UNKNOWN_MCAST_FLOOD_REG VLAN_MEMBER_LIST = CPSW_ALE_UNKNOWN_VLAN_REG else CPSW_ALE_FORCE_UNTAGGED_EGRESS_REG = found CPSW_ALE_FORCE_UNTAGGED_EGRESS_REG CPSW_ALE_UNKNOWN_MCAST_FLOOD_REG = found CPSW_ALE_UNKNOWN_MCAST_FLOOD_REG CPSW_ALE_UNKNOWN_REG_MCAST_FLOOD_REG = found CPSW_ALE_UNKNOWN_REG_MCAST_FLOOD_REG VLAN_MEMBER_LIST = found VLAN_MEMBER_LIST
if ((not SUPER) and (VID_INGRESS_CHECK) and (Rx port is not VLAN member)) then discard the packet
if ((ENABLE_AUTH_MODE) and (source address not found) and not(destination address found and (SUPER))) then discard the packet
if (destination address equals source address) then discard the packet
if (VLAN_AWARE) goto VLAN_Aware_Lookup process else goto VLAN_Unaware_Lookup process

9.4.7.1.11.2 VLAN_Aware Lookup Process

Condition and action

<p>if ((unicast packet) and (destination address found with or without VLAN) and (not SUPER)) then portmask is the logical "AND" of the PORT_NUMBER and VLAN_MEMBER_LIST less the host port and goto Egress process</p>
<p>if ((unicast packet) and (destination address found with or without VLAN) and (not SUPER)) then portmask is the logical "AND" of the PORT_NUMBER and the VLAN_MEMBER_LIST and goto Egress process</p>
<p>if ((unicast packet) and (destination address found with or without VLAN) and (SUPER)) then portmask is the PORT_NUMBER and goto Egress process</p>
<p>if (Unicast packet) # destination address not found then portmask is VLAN member LIST less host port and goto Egress process</p>
<p>if ((Multicast packet) and (destination address found with or without VLAN) and (not SUPER)) then portmask is the logical "AND" of CPSW_ALE_UNKNOWN_MCAST_FLOOD_REG and found destination address/VLAN portmask (PORT_MASK) and VLAN_MEMBER_LIST and goto Egress process</p>

if (Broadcast packet) then use found VLAN_MEMBER_LIST and goto Egress process

9.4.7.1.11.4 Egress Process

Condition and action
Clear Rx port from portmask (don't send packet to Rx port).
Clear disabled ports from portmask.
if ((ENABLE_OUI_DENY) and (OUI source address not found) and (not ALE BYPASS) and (not error packet) and not ((mcast destination address) and (SUPER))) then Clear host port from portmask
if ((not ENABLE_OUI_DENY) and (OUI source address found) and (not ALE BYPASS) and (not error packet) and not ((mcast destination address) and (SUPER))) then Clear host port from portmask
if ((ENABLE_RATE_LIMIT) and (RATE_LIMIT_TX)) then if (not SUPER) and (rate limit exceeded on any tx port) then clear rate limited tx port from portmask If address not found then SUPER cannot be set.
If portmask is zero then discard packet
Send packet to portmask ports.

9.4.7.1.11.5 Learning/Updating/Touching Processes

The learning, updating, and touching processes are applied to each receive packet that is not aborted. The processes are concurrent with the packet forwarding process. In addition to the following, a packet must be received without error in order to learn/update/touch an address.

9.4.7.1.11.5.1 Learning Process

The learning process is applied to each receive packet that is not aborted. The learning process is a concurrent process with the packet forwarding process.

Condition and action
If (directed) then do not learn, update, or set touched else continue
If (not (Learning or Forwarding) or (ENABLE_AUTH_MODE) or (packet error) or (NO_LEARN)) then do not learn address
if ((Non-tagged packet) and (DROP_UNTAGGED)) then do not learn address
if ((VLAN_AWARE) and (VLAN not found) and (unknown VLAN_MEMBER_LIST = "000")) then do not learn address
if ((VID_INGRESS_CHECK) and (Rx port is not VLAN member) and (VLAN found)) then do not learn address
if ((source address found) and (receive port_number != PORT_NUMBER) and (SECURE or BLOCK)) then do not update address else continue

if ((source address found) and (receive port number != PORT_NUMBER)) then update address else continue
--

if ((source address not found) and (VLAN_AWARE) and not (LEARN_NO_VID)) then learn address with VLAN

if ((source address not found) and ((not VLAN_AWARE) or (VLAN_AWARE and LEARN_NO_VID))) then learn address without VLAN
--

9.4.7.1.11.5.2 Updating Process

Condition and action
if (dlr_unicast) then do not update address
If (not(Learning or Forwarding) or (ENABLE_AUTH_MODE) or (packet error) or (NO_SA_UPDATE)) then do not update address
if ((Non-tagged packet) and (DROP_UNTAGGED)) then do not update address
if ((VLAN_AWARE) and (VLAN not found) and (unknown VLAN_MEMBER_LIST = "000")) then do not update address
if ((VID_INGRESS_CHECK) and (Rx port is not VLAN member) and (VLAN found)) then do not update address
if ((source address found) and (receive port number != PORT_NUMBER) and (SECURE or BLOCK)) then do not update address
if ((source address found) and (receive port number != PORT_NUMBER)) then update address

9.4.7.1.11.5.3 Touching Process

if ((source address found) and (ageable) and (not touched)) then set touched

9.4.7.2 CPPI CPDMA Host Interface

9.4.7.2.1 Functional Operation

For legacy reasons this document uses FHost ("cpsw ingress **From Host**") interchangeably with host receive and THost ("cpsw egress **To Host**") interchangeably with host transmit.

Host Software sends and receives network frames via the CPDMA CPPI 3.0 compliant host interface. The host interface includes module registers and host memory data structures. The host memory data structures are buffer descriptors and data buffers. Buffer descriptors are data structures that contain information about a single data buffer. Buffer descriptors may be linked together to describe frames or queues of frames for transmission of data from the host to Ethernet and free buffer queues available for packet data from Ethernet to the host.

After reset, initialization, and configuration the host may initiate CPDMA host interface operations. FHost DMA operations (from host to Ethernet) are initiated by host writes to the appropriate FHost channel head descriptor pointer. The FHost DMA controller then fetches the first packet in the packet chain from memory in accordance with CPPI 3.0 protocol and proceeds with packet operations. The DMA controller fetches the packet data in 64-byte (maximum) bursts.

Host CPDMA THost operations are initiated by host writes to the appropriate THost channel head descriptor pointer after host initialization and configuration. The THost DMA controller writes Ethernet received packet data to external host memory in accordance with CPPI 3.0 protocol.

Field	Description
buffer_offset	Buffer Offset – Indicates how many unused bytes are at the start of the buffer. The buffer offset is reduced to 12-bits. A value of 0x0000 indicates that there are no unused bytes at the start of the buffer and that valid data begins on the first byte of the buffer. A value of 0x000F (decimal 15) indicates that the first 15 bytes of the buffer are to be ignored by the port and that valid buffer data starts on byte 16 of the buffer. The port writes the buffer_offset with the value from the CPDMA_TH_BUFFER_OFFSET register value. The host initializes the buffer_offset to zero for free buffers. The buffer_length must be greater than the CPDMA_TH_BUFFER_OFFSET register value. The buffer offset is valid only on sop .
buffer_length	Buffer Length – Indicates how many valid data bytes are in the buffer. The buffer length is reduced to 12-bits. Unused or protocol specific bytes at the beginning of the buffer are not counted in the Buffer Length field. The host initializes the buffer_length , but the port may overwrite the host initiated value with the actual buffer length value on SOP and/or EOP buffer descriptors. SOP buffer length values will be overwritten if the packet size is less than the size of the buffer or if the offset is nonzero. EOP buffer length values will be overwritten if the entire buffer is not filled up with data. The buffer_length must be greater than zero.
sop	Start of Packet - Indicates that the descriptor buffer is the first buffer in the packet. The port sets the sop bit. 0 - Not start of packet buffer 1 - Start of packet buffer
eop	End of Packet - Indicates that the descriptor buffer is the last buffer in the packet. The port sets the eop bit. 0 - Not end of packet buffer. 1 - End of packet buffer.
ownership	Ownership - Indicates ownership of the packet and is valid only on sop . This bit is set by the host and cleared by the port when the packet has been transferred. The host uses this bit to reclaim buffers. 0 - The packet is owned by the host 1 - The packet is owned by the port
eoq	End Of Queue - Set by the port to indicate that the RX queue empty condition exists. This bit is valid only on eop . The port determines the end of queue condition by a zero next_descriptor_pointer . 0 – The RX queue has more buffers available for reception. 1 - The Descriptor buffer is the last buffer in the last packet in the queue.
teardown_complete	Teardown Complete – Set by the port to indicate that the host commanded teardown process is complete, and the channel buffers may be reclaimed by the host. This bit is valid only on sop . 0 - The port has not completed the teardown process. 1 - The port has completed the commanded teardown process.
passed_crc	Passed CRC – Set by the port to indicate that the CRC was passed with the data. The Packet_Length includes the CRC bytes. The passed_crc bit is valid only on SOP. The p0_tx_crc_remove bit in the CPDMA_Control register determines if CPPI THost packets have a CRC included or not.
long	Jabber Frame – Indicates that the frame is a jabber frame and was not discarded because rx_cef_en was set in the ingress port Pn_MAC_Control register. Valid only on SOP.
short	Fragment Frame – Indicates that the frame is a fragment and was not discarded because rx_cef_en was set in the ingress port Pn_MAC_Control register. Valid only on SOP.
mac_ctl	Control Frame – Indicates that the frame is a MAC control frame and was not discarded because the rx_cmf_en bit was set in the ingress port Pn_Mac_Control register. Valid only on SOP.
overrun	Overrun – Set by the port to indicate that the frame reception was aborted due to THost buffer overrun. This bit is valid only on SOP. 0 – no overrun occurred on the packet 1 – The packet was aborted due to overrun

Field	Description
pkt_error	Packet Contained Error on Ethernet Ingress. This field is valid on SOP. – 00 – no error 01 – CRC error on ingress 10 – Code error on ingress 11 – align error on ingress
vlan_encap	VLAN Encapsulated Packet – Indicates when set that the packet data contains a 32-bit VLAN header word that is included in the packet byte count. This field is set by the port to be the value of the CPDMA_Control register th_vlan_encap bit. If both th_vlan_encap and th_ts_encap are set then the VLAN is first. This encapsulated word also contains the ALE classification FLOW (threadval). This bit is valid on SOP.
ts_encap	Timestamp Encapsulated Packet – Indicates when set that the packet data contains a 64-bit timestamp (two 32-bit words with the lower 32-bit word first) that is included in the packet byte count. This field is set by the port to be the value of the CPDMA_Control register th_ts_encap bit. If both th_vlan_encap and thost_ts_encap are set then the VLAN is first. This bit is valid on SOP.
chksum_encap	Checksum Encapsulated Packet – Indicates when set that the packet data contains 4-bytes of THost checksum information at the end of the packet (last 4 bytes). The packet length includes the checksum bytes.
memory_protect_error	Memory Protect Error – An error was detected in the packet Castignoli protect CRC. The Packet should be dropped by the host.
from_port	From Port – Indicates the Ethernet ingress port number. This field is valid only on SOP.
packet_length	Packet Length – Specifies the number of bytes in the entire packet. Offset bytes are not included. The sum of the buffer_length fields should equal the packet_length . Valid only on SOP.

9.4.7.2.2.3 THost CPDMA Channel Teardown

The host commands a THost channel teardown by writing the channel number to the **CPDMA_TH_TEARDOWN** register. When a teardown command is issued to an enabled THost channel the following will occur:

- Any current frame in reception will complete normally.
- The **teardown_complete** bit will be set in the next THost buffer descriptor in the chain if there is one.
- The channel head descriptor pointer will be cleared to zero
- A THost interrupt for the channel will be issued to the host.
- The host should acknowledge a teardown interrupt with a 0xffffffc acknowledge value

Channel teardown may be commanded on any channel at any time. The host is informed of the teardown completion by the set teardown complete buffer descriptor bit. The port does not clear any channel enables due to a teardown command. A teardown command to an inactive channel issues an interrupt that software should acknowledge with a 0xffffffc acknowledge value (note that there is no buffer descriptor in this case). Software may read the interrupt acknowledge location to determine if the interrupt was due to a commanded teardown. The read value will be 0xffffffc if the interrupt was due to a teardown command.

9.4.7.2.3 FHost CPDMA Interface

The FHost DMA is an eight channel CPPI 3.0 compliant interface. Priority between the eight queues may be either fixed or round robin as selected by **FH_PTYPE** in the **CPDMA_Control** register. If the priority type is fixed, then channel 7 has the highest priority and channel 0 has the lowest priority. Round robin priority proceeds from channel 0 to channel 7. Packet Data transfers occur on the TX_VBUSP interface in 64-byte maximum burst transfers. Any packet can be designated by the host to generate a host timesync event on Ethernet egress by setting the **host_event** bit in the packet buffer descriptor.

9.4.7.2.3.1 FHost CPDMA Host Configuration

To configure the CPDMA for FHost operations the host must do the following:

- Initialize the **CPDMA_FH(0..7)_HDP** registers to a zero value.
- Enable the desired ingress interrupts in the **CPDMA_FH_INTSTAT_MASKED_SET** register.
- Setup the transmit channel(s) buffer descriptors in host memory as defined in CPPI 3.0.

- Configure and enable the ingress operation as desired in the CPDMA_FH_Control register.
- Write the appropriate CPDMA_FH(0..7)_HDP registers with the appropriate values to start packet operations.

9.4.7.2.3.2 FHost CPDMA Buffer Descriptors

An FHost buffer descriptor is a contiguous block of four 32-bit data words aligned on a 32-bit word boundary.

Table 9-21. FHost Buffer Descriptor format

Word Offset	Bit fields																															
	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	next descriptor pointer																															
1	buffer pointer																															
2	buffer offset															buffer length																
3	s e o e t p c r t t o o h c r o o w o e a r e o o o h e p p n q e a s c s _ _ s k s e r s _ e _ p o t s e r s d _ t r _ u r s h o c y v r r e m v h w r p e t t e e d l n c e d _ e n n p _ c o m p l e t e															packet_length																

Name	Description
next_descriptor_pointer	Next Descriptor Pointer - The 32-bit word aligned memory address of the next buffer descriptor in the FHost queue. This is the mechanism used to reference the next buffer descriptor from the current buffer descriptor. If the value of this pointer is zero then the current buffer is the last buffer in the queue. The host sets the next_descriptor_pointer .
buffer_pointer	Buffer Pointer - The byte aligned memory address of the buffer associated with the buffer descriptor. The host sets the buffer_pointer .
buffer_offset	Buffer Offset – Indicates how many unused bytes are at the start of the buffer. A value of 0x0000 indicates that no unused bytes are at the start of the buffer and that valid data begins on the first byte of the buffer. A value of 0x000F (decimal 15) indicates that the first 15 bytes of the buffer are to be ignored by the port and that valid buffer data starts on byte 16 of the buffer. The host sets the buffer_offset value (which may be zero to the buffer length minus 1). Valid only on sop .
buffer_length	Buffer Length – Indicates how many valid data bytes are in the buffer. Unused or protocol specific bytes at the beginning of the buffer are not counted in the Buffer Length field. The host sets the buffer_length . The buffer_length must be greater than zero.
sop	Start of Packet - Indicates that the descriptor buffer is the first buffer in the packet. 0 - Not start of packet buffer 1 - Start of packet buffer

Name	Description
eop	End of Packet - Indicates that the descriptor buffer is the last buffer in the packet. 0 - Not end of packet buffer. 1 - End of packet buffer.
ownership	Ownership - Indicates ownership of the packet and is valid only on sop . This bit is set by the host and cleared by the port when the packet has been transferred. The host uses this bit to reclaim buffers. 0 - The packet is owned by the host 1 - The packet is owned by the port
eop	End Of Queue - Set by the port to indicate that all packets in the queue have been transferred and the FHost queue is empty. End of queue is determined by the port when the next_descriptor_pointer is zero on an eop buffer. This bit is valid only on eop . 0 - The FHost queue has more packets to transfer. 1 - The Descriptor buffer is the last buffer in the last packet in the queue.
teardown_complete	Teardown Complete – Set by the port to indicate that the host commanded teardown process is complete, and the channel buffers may be reclaimed by the host. This bit is valid only on sop . 0 - The port has not completed the teardown process. 1 - The port has completed the commanded teardown process.
crc_type	CRC Type – 0 – Ethernet CRC 1 – Castagnoli CRC (if \$CPPI_Cast = 1)
pass_crc	Pass CRC – Valid only on SOP 0 – A CRC is not included with the packet data. The Ethernet port(s) will generate the CRC on Ethernet egress. A CRC (or placeholder) at the end of the data is allowed, but not required, and the buffer_count and packet_length fields should not include the CRC bytes if they are present. 1 – A CRC is included with the host packet data. The packet_length and buffer_count fields should include the four CRC bytes. The host supplied CRC should be in the last four bytes of the data.
to_port	To Port – Port number to send the directed packet to. This field is set by the host. This field is valid on SOP. Directed packets go to the directed port, but an ALE lookup is performed to determine untagged egress in VLAN_AWARE mode. 1 – Send the packet to port 1 if to_port_en is asserted. 2 – Send the packet to port 2 if to_port_en is asserted.
to_port_en	To Port Enable – Indicates when set that the packet is a directed packet to be sent to the to_port field port number. This field is set by the host. The packet is sent to one port only (index not mask). This bit is valid on SOP. 0 – not a directed packet 1 – directed packet
host_event	Host Timesync Event – Generate a host timesync event on Ethernet egress. The upper 28-bits of the packet SOP buffer descriptor address are the domain[7:0], message_type[3:0], and sequence_id[15:0] in that order. 0 – The packet will not generate a host event on Ethernet egress 1 – The packet will generate a host event on Ethernet egress
chksum_encap	Checksum Encapsulated Packet – Indicates when set that the packet data contains 4-bytes of FHost checksum information at the start of the packet (first 4 bytes). The packet length includes the checksum bytes.

Name	Description
packet_length	Packet Length – Specifies the number of bytes in the entire packet. Offset bytes are not included. The sum of the buffer_length fields should equal the packet_length. Valid only on SOP. The packet length must be greater than zero. The packet data will be truncated to the packet length if the packet length is shorter than the sum of the packet buffer descriptor buffer lengths. A host error occurs if the packet length is greater than the sum of the packet buffer descriptor buffer lengths.

9.4.7.2.3.3 FHost CPDMA Channel Teardown

The host commands a FHost channel teardown by writing the channel number to the **CPDMA_FH_Teardown** register. When a teardown command is issued to an enabled FHost channel the following will occur:

- Any frame currently in transmission will complete normally
- The teardown complete bit will be set in the next sop buffer descriptor (if there is one).
- The channel head descriptor pointer will be set to zero.
- An interrupt will be issued to inform the host of the channel teardown.
- The host should acknowledge a teardown interrupt with a 0xfffffc acknowledge value

Channel teardown may be commanded on any channel at any time. The host is informed of the teardown completion by the set teardown complete buffer descriptor bit. The port does not clear any channel enables due to a teardown command. A teardown command to an inactive channel issues an interrupt that software should acknowledge with a 0xfffffc acknowledge value (note that there is no buffer descriptor in this case). Software may read the interrupt acknowledge location to determine if the interrupt was due to a commanded teardown. The read value will be 0xfffffc if the interrupt was due to a teardown command.

9.4.7.2.4 VLAN Aware Mode

The CPSW is in VLAN aware mode when the CPSW Control register **vlan_aware** bit is set. In VLAN aware mode port 0 THost packets may or may not be VLAN encapsulated depending on the CPDMA_Control register **th_vlan_encap** bit. The header packet VLAN is generated as described in later sections of this specification. VLAN encapsulated receive packets have a 32-bit VLAN header encapsulation word added to the packet data. VLAN encapsulated packets are specified by a set **vlan_encap** bit in the packet buffer descriptor. The VLAN encapsulation header is included in the packet length and has the below format:

32-bit VLAN Header Encapsulation Word																																						
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0							
h			h	hdr_pkt_vid												f											p		reserved									
d			d													l								k														
r			r													o								t														
–			–													w							–															
p			p																				t															
k			k																				y															
t			t																				p															
–			–																				e															
p			p																																			
r			r																																			
l			l																																			
o																																						
r																																						
l																																						
t																																						
y																																						

Field	Description
hdr_pkt_priority	Header Packet VLAN priority (7 is highest priority)
hdr_pkt_cfi	Header Packet VLAN CFI bit. The
hdr_pkt_vid	Header Packet VLAN ID.

Field	Description
flow	FLOW – A nonzero value indicates that the ALE matched a classifier with the flow (threadval).
pkt_type	Packet Type – Indicates whether the packet is a VLAN tagged, priority tagged or non-tagged packet. 00 – VLAN tagged packet 01 – reserved 10 – priority tagged packet 11 – non-tagged packet

9.4.7.2.5 VLAN Unaware Mode

The CPSW is in VLAN unaware mode when the CPSW Control register **vlan_aware** bit is cleared. Port 0 THost packets (egress) may or may not be VLAN encapsulated depending on the CPSW Control register **th_vlan_encap** bit.

9.4.7.2.6 CPDMA Command IDLE

The **cmd_idle** bit in the **CPDMA_Control** register allows CPDMA operation to be suspended. When the idle state is commanded, the CPDMA will stop processing THost and FHost frames at the next frame boundary. Any frame currently in reception or transmission will be completed normally without suspension. For FHost, any frame in process will be completed. For THost, frames that are detected by the CPDMA after the suspend state is entered are ignored. No statistics will be kept for ignored frames. Commanded idle is similar in operation to emulation control and clock stop.

9.4.7.2.7 CPDMA CPPI 3.0 Interface Bandwidth

The HOST CPPI 3.0 FHost and THost interfaces are capable of supporting linerate on the Ethernet ports provided that the clock frequency is sufficient, and provided that the Host master VBUSP read/write latency is low.

9.4.8 CPPI Checksum Offload

The CPPI host port can be enabled to perform checksum offload on host port packet ingress and egress. UDP and TCP over IPV4 and IPV6 are supported. For the purposes of checksum description, the first packet byte (the first byte of the destination address) is byte 1 (not byte 0). That is, a 64 byte packet goes from byte 1 to byte 64. For all packet types, the **s_cn_switch** bit must be set for the **vlan_ltype_outer** to be supported. Because it's not now a dual vlan switch, A C-switch cannot have an outer VLAN. An S-switch can have an inner, an outer, or both (outer then inner).

9.4.8.1 CPPI THost Checksum Offload

When **p0_tx_chksum_en** is set in **P0_Control**, IPV4 and IPV6 UDP and TCP packets received on any Ethernet port and destined for port 0 egress are checked for correct checksum as described below. The EOP THost buffer descriptor bit **chksum_encap** indicates whether or not the THost checksum information is included with the THost egress packet or not. If the checksum information is included in the packet the **packet_length** includes the four checksum information bytes. The byte counts below are shown for packets with no VLAN's. The byte counts vary with one or two packet VLANs. Packets received on an Ethernet port with errors are not checked for a correct checksum if they are passed to the host (no checksum information with the error packet).

9.4.8.1.1 IPV4 UDP

- Byte 15 Upper Nibble = 4 for IPV4
- Byte 15 Lower Nibble = IHL - Nibble with number of 32-bit words in IPV4 header (5 to 15 supported).
- Bytes 20:21 = fragment[15:0] – Bit 13 is the MF bit and bits 12:0 are the Fragment offset. A packet is a fragment if the MF bit is set or if the fragment offset is non-zero. The first packet fragment has MF=1 with a zero offset. Middle fragments have MF=1 with a nonzero offset. The last packet fragment has MF=0 with a nonzero offset. Non-fragmented packets have MF=0 and a zero offset. A count is output for packet fragments but no errors are reported. First fragments have the UDP header included in the count. Middle and last fragments have only data included in the count (there is no UDP header).

- Byte 24 = 0x11 for UDP protocol.
- Received packet UDP checksum of zero means that there is no IPV4 checksum sent with the packet so no error will be issued.
- Received packet UDP checksum of 0xffff means that the checksum was calculated to be 0xffff or 0x0000 but was sent in the transmitted packet as 0xffff by the sending originating entity.

9.4.8.1.2 IPV4 TCP

- Byte 15 Upper Nibble = 4 for IPV4
- Byte 15 Lower Nibble = IHL - Nibble with number of 32-bit words in IPV4 header (5 to 15 supported).
- Bytes 20:21 = fragment[15:0] – Bit 13 is the MF bit and bits 12:0 are the Fragment offset. A packet is a fragment if the MF bit is set or if the fragment offset is non-zero. The first packet fragment has MF=1 with a zero offset. Middle fragments have MF=1 with a nonzero offset. The last packet fragment has MF=0 with a nonzero offset. Non-fragmented packets have MF=0 and a zero offset. A count is output for packet fragments but no errors are reported. First fragments have the UDP header included in the count. Middle and last fragments have only data included in the count (there is no TCP header).
- Byte 24 = 0x06 for TCP protocol.

9.4.8.1.3 IPV6 UDP

- Byte 15 upper nibble = 6 for IPV6.
- Byte 21 = 0x11 for UDP protocol as next header.
- Fragment extension headers are supported. First fragments have a fragment extension header (byte 21 = 0x2c) followed by a UDP header (byte 55 = 0x11). Middle and last fragments have a fragment extension header followed by data only (no UDP header). The first packet fragment has MF=1 with a zero offset. Middle fragments have MF=1 with a nonzero offset. The last packet fragment has MF=0 with a nonzero offset. Non-fragmented packets do not have a fragment extension header. A count is output for packet fragments but no errors are reported.
- Received packet UDP checksum of zero means that there is no IPV6 checksum sent with the packet so no error will be issued.
- Received packet UDP checksum of 0xffff means that the checksum was calculated to be 0xffff or 0x0000 but was sent in the transmitted packet as 0xffff by the sending originating entity.

9.4.8.1.4 IPV6 TCP

- Byte 15 upper nibble = 6 for IPV6.
- Byte 21 = 0x06 for TCP protocol as next header.
- Fragment extension headers are supported. First fragments have a fragment extension header (byte 21 = 0x2c) followed by a UDP header (byte 55 = 0x06). Middle and last fragments have a fragment extension header followed by data only (no TCP header). The first packet fragment has MF=1 with a zero offset. Middle fragments have MF=1 with a nonzero offset. The last packet fragment has MF=0 with a nonzero offset. Non-fragmented packets do not have a fragment extension header. A count is output for packet fragments but no errors are reported.

9.4.8.1.5 THost Checksum Encapsulation Word

The 4-byte checksum encapsulation word is included as the last 4-bytes of the THost packet data when EOP buffer descriptor **chksum_encap** is set. The **packet_length** includes the four encapsulation bytes.

FHost Checksum Encapsulation Word																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
reserved											i	i	t	f	c	checksum_add															
											p	p	c	r	h																
											v	v	p	a	k																
											4	6	_	g	s																
											_	_	u	m	u																
											v	v	d	e	m																
											a	a	p	n	_																
											l	l	_	t	e																
											i	i	n	r	r																
											d	d		r	r																
														o	r																

Field	Name	Description
31:21	reserved	
20	ipv4_valid	IPV4 Valid – An IPV4 TCP or UDP packet was detected
19	ipv6_valid	IPV6 Valid – An IPV6 TCP or UDP Packet was detected
18	tcp_udp_n	TCP or UDP packet – Valid only when either the ipv4_valid or ipv6_valid bits are set. 0 – Indicates UDP packet was detected. 1 – Indicates TCP packet was detected.
17	fragment	Fragment – Indicates that an IP fragment was detected. Valid only when either the ipv4_valid or ipv6_valid bits are set.
16	checksum_error	Checksum Error detected. Valid only when either the ipv4_valid or ipv6_valid bits are set.
15:0	checksum_add	Checksum Add Value – This is the value that was summed during the checksum computation. This value is 0xffff for IPV4/6 UDP/TCP packets with no checksum error.

9.4.8.2 CPPI FHost Checksum Offload

Packets sent from host port 0 (switch ingress) to any Ethernet port can have a checksum calculated and inserted into the Ethernet egress packet. The **rx_chksum_en** bit in the **P0_CONTROL** register must be set for receive checksum operation to be enabled. When enabled and when the **chksum_encap** SOP FHost buffer descriptor is set, the first four packet bytes contain the checksum information which determines how the checksum is calculated. The **checksum_result** field determines where the checksum is inserted in the egress packet. The checksum result location is adjusted by the egress port if a VLAN is to be inserted or removed on Ethernet port egress.

9.4.8.2.1 FHost Checksum Encapsulation Word

The 4-byte FHost checksum encapsulation word is included as the first four bytes of the packet data when **chksum_encap** is set in the FHost SOP buffer descriptor. The **packet_length** includes the four checksum encapsulation bytes.

FHost Checksum Encapsulation Word																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
checksum_result								checksum_start_byte								c h k s u m _ i n v		r e s e r v e d		checksum_bytecount													

Field	Name	Description
31:24	checksum_result	Checksum Result Byte Location – This is the packet byte number where the checksum result will be placed in the egress packet. The first packet byte which is the first byte of the destination address is byte 1 (not byte zero).
23:16	checksum_start_byte	Checksum Start Byte – This is the packet byte number to start the checksum calculation on. The first packet byte is byte 1.
15	chksum_inv	Checksum Invert Zero – When set, a zero checksum value will be inverted and sent as 0xffff.
14	reserved	
13:0	checksum_bytecount	Checksum Byte Count – This is the number of bytes to calculate the checksum on. The outgoing Ethernet packet will have a checksum inserted when this value is non-zero.

9.4.9 Jumbo packets

Jumbo packets are supported on the device. The size of the jumbo packet is 3024 bytes. No special configuration is required apart from appropriate length in the length fields of descriptors.

9.4.10 Zero touch of Tx (From Host) buffer descriptors

The configured fields of the Tx (From Host) buffer descriptors shall not be touched by CPSW HW to enable reuse of a pre-programmed list of buffer descriptors.

This feature can be enabled by setting the 'fhost_ownership' bit in the CPDMA_CONTROL register.

When this is enabled the ownership bit in the Descriptor is not be touched by the HW. This enables the descriptors to be reused without much CPU intervention.

CPDMA_Control - Control

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Type	r	w	r	w	r	w	r	w	r

Bit	Name	Description
31:9	reserved	read as zero
8	fhost_ownership	FHost Ownership Write Bit Value. 0 – The CPDMA writes the FHost buffer descriptor ownership bit to zero at the end of packet processing as specified in CPPI 3.0. 1 – The CPDMA writes the FHost buffer descriptor ownership bit to one at the end of packet processing. Users who do not use the ownership mechanism can use this mode to preclude the necessity of software having to set this bit each time the buffer descriptor is used. Software must set this bit when building the packet chain.
7	thost_ch_override	THost Channel Classification Match Override Enable 0 – The THost channel is not overridden with the ALE classification match. 1 – The THOST channel is overridden with the lower 3-bits of the ALE classification match value (if a classification match occurred).

Bit	Name	Description
6	thost_ts_encap	THost Packet Timestamp Encapsulation 0 – THost packets do not contain a 64-bit timestamp 1 – THost packets contain a 64-bit timestamp prepended to the packet data (32-bit lsword first).
5	thost_vlan_encap	THost Packet VLAN Encapsulation 0 – THost packets are not VLAN encapsulated 1 – THost packets are VLAN encapsulated
4	thost_cef	THost Copy Error Frames Enable – Enables THost DMA overrun frames to be transferred to memory (up to the point of buffer overrun). The overrun error bit will be set in the frame EOP buffer descriptor. Overrun frame data will be filtered when thost_cef is not set. THost frames with other error bits set are not affected by this bit. This is related only to frames that overrun on the THost DMA due to buffer limitations. 0 – Frames containing overrun errors are filtered. 1 – Frames containing overrun errors are transferred to memory.
3	cpdma_cmd_idle	CPDMA Command Idle 0 – Idle not commanded 1 – Idle Commanded (read idle in CPDMA_Status register)
2	thost_offlen_block	THost Offset/Length word write block. 0 – Do not block the DMA writes to the THost buffer descriptor offset/buffer length word. The offset/buffer length word is written as specified in CPPI 3.0. 1 – Block all CPDMA DMA controller writes to the THost buffer descriptor offset/buffer length words during CPPI packet processing. When this bit is set, the CPDMA will never write the third word to any THost buffer descriptor.
1	thost_ownership	THost Ownership Write Bit Value. 0 – The CPDMA writes the THost buffer descriptor ownership bit to zero at the end of packet processing as specified in CPPI 3.0. 1 – The CPDMA writes the THost buffer descriptor ownership bit to one at the end of packet processing. Users who do not use the ownership mechanism can use this mode to preclude the necessity of software having to set this bit each time the buffer descriptor is used. Software must set this bit when building the packet chain.

Bit	Name	Description
0	fhost_ptype	FHost Queue Priority Type 0 – The queue uses a round robin scheme to select the next channel. 1 – The queue uses a fixed (channel 7 highest priority) priority scheme to select the next channel.

9.4.11 Continuous transfer of packets from the queue with an end of transmission indication

After the completion of the transfer of all the queued packet an interrupt to the host is raised instead of at each packet transfer.

The details of enabling this is as described below.

Fhost Packet Completion Interrupts

The FHost DMA controller has eight channels with each channel having a corresponding interrupt (**FH_PEND[7:0]**). The FHost interrupts are level interrupts that remain asserted until cleared by the host. Each of the eight channel interrupts may be individually enabled by setting to one the appropriate bit in the **CPDMA_FH_IntMask_Set** register. Each of the eight channel interrupts may be individually disabled by clearing to zero the appropriate bit in the **CPDMA_FH_IntMask_Clear** register. The raw and masked interrupt status may be read by reading the **CPDMA_FH_IntStat_Raw** and **CPDMA_FH_IntStat_Masked** registers respectively. When each packet transfer is complete, the CPDMA issues an interrupt to the host by writing the packet's last buffer descriptor address to the appropriate channel **CPDMA_FH(0..7)_CP** completion pointer register. The interrupt is generated by the write regardless of the value written. Upon interrupt reception, the host processes one or more packets from the queue and then acknowledges an interrupt by writing the address of the last buffer descriptor processed to the queue's associated Fhost Completion Pointer. If the host written buffer address value is different from the buffer address written by the port then the level interrupt remains asserted which means that the CPDMA has transferred more packets than the host has processed interrupts for. If the host written buffer address value is equal to the port written value then the host has processed all packets that the CPDMA has transferred and the level interrupt is deasserted. The CPDMA write to the completion pointer actually stores the value. The host written value is actually not written to the register location. The host written value is compared to the register contents which was written by the CPDMA and if the two values are equal then the interrupt is removed, otherwise the interrupt remains asserted. The host may process multiple packets previous to acknowledging an interrupt, or the host may acknowledge interrupts for every packet. Refer to the referenced CPPI 3.0 specification for more details on interrupt processing.

Fhost Interrupt on EOQ

A channel packet completion will issue an interrupt only on EOQ when the corresponding **fhost_eoq_int[7:0]** bit is set in the **CPDMA_FH_Control2** register. This mode allows an entire chain of packets to be transferred before an interrupt is issued to the host (instead of interrupting at the completion of each individual packet).

9.4.12 Controlled transmission of packets

The device supports to control the transmission of the packets based on an external trigger indication. The CPDMA shall fetch the next packet (from the SOP indication) only when an external trigger indication is also satisfied.

FHost CPDMA Hardware Controlled Packet Transmission

When configured with hardware packet transmission the FHost interface can be enabled to transfer packets due to rising edges on a channel's corresponding **FH_HW_TRIG[7:0]** input. Each channel has

a corresponding independent internal **send_cnt[15:0]** counter. To enable the hardware controlled packet transmission for a channel, software sets the channel's corresponding bit in the **fh_hw_trig_en[7:0]** field in the **CPDMA_FH_Control2** register. Hardware packet transmission then operates as described below:

- The channel **send_cnt[15:0]** is cleared to zero when the channel HDP is zero (IDLE).
- Software writes the channel HDP to begin the packet chain operation.
- An asserted **FHOST_HW_TRIG[7:0]** input increments the associated channel **send_cnt[15:0]** when the channel's HDP is non-zero.
- A single packet is transferred when **send_cnt > 0** and then the **send_cnt** is decremented.
- Go to a #a (IDLE) on EOQ which also zeroes the HDP, otherwise go to #d.

9.4.13 Egress Packet Operations

Each CPSW egress port (Ethernet and Host) is capable of performing egress packet processing operations. **IntraVLAN** processing either adds, removes, or replaces VLAN information or does nothing. **InterVLAN** routing allows hardware routing between a limited number of VLANs - thereby allowing high-bandwidth or other routing operations to be offloaded from software to the CPSW (hardware). IntraVLAN processing and InterVLAN routing operations are mutually exclusive. In addition, OAM loopback allows the loopback packet source and destination addresses can be swapped on egress to facilitate OAM or generic testing operations.

9.4.13.1 IntraVLAN Processing

All ports (Ethernet and CPPI) process packet VLAN's identically on cpsw egress. CPSW ingress packet VLAN's are not modified on ingress regardless of the port type or VLAN mode.

9.4.13.1.1 VLAN Unaware Mode

An egress port is operating in the VLAN unaware mode when the **VLAN_AWARE** bit in the **CPSW_Control** register is cleared to zero. In VLAN unaware mode, transmit (egress) packets are not modified on egress (no IntraVLAN processing).

9.4.13.1.2 VLAN Aware Mode

An egress port is operating in the VLAN aware mode when the **VLAN_AWARE** bit in the **CPSW_Control** register is set. In VLAN aware mode, transmitted packet data is changed depending on the packet type, the packet priority (**pkt_pri**), and the VLAN information as shown in the below tables. The **vlan_ltype_sel** value is selected by the **s_cn_switch** bit in the **CPSW_Control** register and is either the **vlan_ltype_inner** (0x8100 default) or **vlan_ltype_outer** (0x88a8 default) value. The **force_untagged_egress** bit comes from the Address Lookup Engine (ALE) lookup:

VLAN Aware Mode Non Tagged Transmit Packet Processing	
Insert VLAN Case	Non-tagged input packets have the header packet VLAN inserted when the force_untagged_egress bit in the transmit packet header (from the ALE) is de-asserted. The vlan_ltype_sel length/type is inserted after the source address followed by the two byte header packet VLAN. The header packet VLAN is composed of the hdr_pkt_pri , the hdr_pkt_cfi , and the hdr_pkt_vid . The packet length/type field is output four bytes later than it is input and is not removed or replaced.
No Change Case	Non tagged input packets are output unchanged when the force_untagged_egress transmit packet header bit is asserted.

VLAN Aware Mode Priority Tagged Transmit Packet Processing	
Replace PRI/VID Case	Priority tagged input packets have the packet VLAN ID (VID) and the packet priority replaced with the hdr_pkt_vid and the hdr_pkt_pri when the transmit packet header force_untagged_egress bit (from the ALE) is de-asserted.
Remove VLAN Case	Priority tagged input packets have the 4-byte packet VLAN information removed when the transmit packet header force_untagged_egress bit (from the ALE) is asserted. The vlan_ltype_sel length/type is removed as is the two byte packet VLAN. Input 64-67 byte priority tagged packets go out with the VLAN removed and padded to 64-bytes. The input CRC bytes are used as the pad data. Input 64-byte priority tagged packets use all four input CRC bytes as pad, input 65-byte priority tagged packets use three of the input CRC bytes as pad, and so on.

VLAN Aware Mode VLAN Tagged Transmit Packet Processing	
Replace PRI Case	VLAN tagged input packets are output with the packet priority replaced with the hdr_pkt_pri when the transmit packet header force_untagged_egress bit is de-asserted.
Remove VLAN Case	VLAN tagged input packets have the 4-byte packet VLAN information removed when the transmit packet header force_untagged_egress bit is asserted. The vlan_ltype_sel length/type is removed as is the two byte packet VLAN. Input 64-67 byte VLAN tagged packets go out with the VLAN removed and padded to 64-bytes. The input CRC bytes are used as the pad data. Input 64-byte VLAN tagged packets use all four input CRC bytes as pad, input 65-byte VLAN tagged packets use three of the input CRC bytes as pad, and so on. The output CRC is generated when the VLAN is removed.

VLAN tagged ingress packets of 64 to 67-bytes will be padded to 64-bytes on egress (Ethernet and CPPI port egress) if the VLAN is to be removed on egress.

9.4.13.2 ALE Egress Opcode Operations

The Address Lookup Engine (ALE) can be setup to pass an 8-bit opcode to the destination port(s) egress packet processing logic. InterVLAN routing and OAM Source/Destination address swap are supported operation codes as shown in the below table.

ALE Egress OP Code	Egress Operation
0x00	No egress opcode (NOP)
0x01	InterVLAN (route) opcode 1
0x02	InterVLAN (route) opcode 2
0x03	InterVLAN (route) opcode 3
0x04	InterVLAN (route) opcode 4
0x05-0xFE	reserved
0xFF	DA/SA Swap opcode

9.4.13.2.1 InterVLAN Routing

The CPSW is capable of InterVLAN routing with a limited number of routes (InterVLAN opcode 1 to 4). The Address Lookup Engine (ALE) determines an InterVLAN egress opcode for each packet to be VLAN routed via a classifier/policer configured for the route. Non VLAN routed packets do not have an InterVLAN (egress) opcode. The ALE classifier/policer can use the ingress packet destination address, source address, VLAN, IPDA, and/or IPSA to determine if a packet is to be VLAN routed or not. If a packet is to be routed, then the InterVLAN opcode is used on Ethernet packet egress with a total of 4 available VLAN routes (opcodes) per egress port. Each InterVLAN routing opcode contains the below fields in the opcode's associated **Pn_InterVLAN_OPX_x** registers (where **x** = A to D):

Field	Description
da[47:0]	Destination Address
sa[47:0]	Source Address
vid[11:0]	VLAN ID
replace_da_sa	When set, the routed packet Destination Address is replaced with da[47:0] and the packet Source Address is replaced with sa[47:0] from InterVLAN opcode x (the selected egress opcode).
replace_vid	When set, Replace the packet VLAN ID with vid[11:0] from InterVLAN opcode x (the selected egress opcode).

Field	Description
dest_force_untagged_egress	<p>Remove the VLAN on the egress routed packet when set (associated with the destination VLAN).</p> <hr/> <p style="text-align: center;">Note</p> <p>The ALE force_untagged_egress bit from the ALE is for the source VLAN and is ignored for an InterVLAN routed packet. On InterVLAN routed packets this bit is used because it is associated with the destination vlan. This dest_force_untagged_egress bit would not be set by software if the destination VLAN is different from the port VLAN since that might cause leaky VLANs.</p> <hr/>
decrement_ttl	<p>When set, the Time To Live (TTL) field in the header is decremented:</p> <ul style="list-style-type: none"> • IPV4 – Decrement the TTL byte and update the Header Checksum • IPV6 – Decrement the Hop Limit. <p>note: The ALE will send any IPv4/6 packet with a zero or one TTL field to the host. When this bit is cleared the TTL/Hop Limit fields are not checked or modified.</p>

9.4.13.2.2 OAM Source and Destination Address Swap

To facilitate OAM or generic testing, the ALE can be configured to loopback packets from Ethernet receive to Ethernet Transmit. Packets destined for OAM loopback have only the source address and destination addresses swapped. No other egress processing is performed. The ALE does not perform lookups for a port in OAM loopback mode, but directed packets are transferred as normal.

9.4.14 IEEE 1588 Clock Synchronization Support

The CPSW supports 1588 clock synchronization (annex D, annex E, and annex F). Ethernet GMII Transmit and receive time sync operation are supported. Time sync is double-step on egress but may be single-step on ingress.

9.4.14.1 1588 Receive (Ingress) Packet Operation

There are two CPSW egress time sync interfaces for each Ethernet port. The first is the TS_RX_MII interface and the second is the TS_RX_DEC interface. Both interfaces are generated in the switch and are input to the CPTS module. There are register bits in the CPSW that control time sync operations in addition to the registers in the CPTS module. The TS_RX_MII interface issues a record signal along with a handle to the CPTS controller for each packet that is received. The record signal is a single clock pulse indicating that a receive packet has been detected at the associated port MII interface. The handle value is incremented with each packet and rolls over to zero after 15. There are 16 possible handle values so there can be a maximum of 16 packets “in flight” from the TS_RX_MII to the TS_RX_DEC block at any given time. A handle value is reused (not incremented) for any received packet that is shorter than about 31 octets (including preamble). Handle reuse on short packets prevents any possible overrun condition if multiple fragments are consecutively received. The TS_RX_MII logic is in the receive wireside clock domain. There is no decode logic in the TS_RX_MII to determine if the packet is a time sync event packet or not. Each received packet generates a record signal and new handle. The handle is sent to the CPTS controller with the record pulse and the handle is also sent to the TS_RX_DEC block along with the packet. The packet decode is performed in the TS_RX_DEC block. The decode function is separated from the record function because in some systems the incoming packet can be encrypted. The decode function would be after packet decryption in those systems.

The TS_RX_DEC function decodes each received packet and determines if the packet meets the time sync event packet criteria. If the packet is determined to be a time sync event packet, then the time sync event is signaled to the CPTS controller via the TS_RX_DEC interface. If the packet is determined to be a time sync event packet and if the ALE did not drop the packet (the packet was to be sent to at least one port), then the ALE lookup is overridden and the packet is forced only to the host. The event signal is a single clock pulse indicating that the packet matched the time sync event packet criteria and that the associated packet handle, message type, and sequence ID are valid. No indication is given for received packets that do not meet the time sync event

criteria. The 16-bit sequence ID is found in the time sync event packet at the sequence ID offset into the PTP message header (**pn_ts_seq_id_offset**). The 8-bit domain number is found in the time sync event packet at the domain offset into the PTP message header (**pn_ts_domain_offset**). A packet is determined to be a receive event packet under the following conditions.

Note

TS_RX_DEC and TS_RX_MII are internal interfaces that have no registers. They are included here for description purposes only.

9.4.14.1.1 Annex D (IPv4)

1. Receive annex D time sync is enabled (pn_ts_rx_annex_d_en is set in the Pn_TS_Ctl register).
2. One of the sequences below is true.
 - The first packet LTYPE matches 0x0800
 - The first packet LTYPE matches ts_vlan_ltype1 and ts_rx_vlan_ltype1_en is set and the second packet LTYPE matches 0x0800
 - The first packet LTYPE matches ts_vlan_ltype2 and ts_rx_vlan_ltype2_en is set and the second packet LTYPE matches 0x0800
 - The first packet LTYPE matches ts_vlan_ltype1 and ts_rx_vlan_ltype1_en is set and the second packet LTYPE matches ts_vlan_ltype2 and ts_rx_vlan_ltype2_en is set and the third packet LTYPE matches 0x0800
3. Byte 14 (the byte after the LTYPE) contains 0x45 (IP_VERSION). Note that the byte numbering assumes that there are no VLANs. The byte number is intended to show the relative order of the bytes.
4. Byte 20 contains 0bXXX00000 (5 lower bits zero) and Byte 21 contains 0x00 (fragment offset zero)
5. Byte 22 contains 0x01 (HOP Limit = 1) if the ts_ttl_nonzero bit in the switch Pn_TS_CTL_LTYPE2 register is zero, or byte 22 contains any value if ts_ttl_nonzero is set. Byte 22 is the TTL/HOP field.
6. Byte 23 contains 0x11 (Next Header UDP Fixed).
7. The ts_uni_en bit in the Pn_TS_Ctl_Ltype2 register is zero and Bytes 30 through 33 contain:
 - Decimal 224.0.1.129 and the ts_129 bit in the Pn_TS_Ctl_Ltype2 register is set, or
 - Decimal 224.0.1.130 and the ts_130 bit in the Pn_TS_Ctl_Ltype2 register is set, or
 - Decimal 224.0.1.131 and the ts_131 bit in the Pn_TS_Ctl_Ltype2 register is set, or
 - Decimal 224.0.1.132 and the ts_132 bit in the Pn_TS_Ctl_Ltype2 register is set, or
 - Decimal 224.0.0.107 and the ts_107 bit in the Pn_TS_Ctl_Ltype2 register is set

Or:

The ts_uni_en bit in the Pn_TS_Ctl_Ltype2 register is set and Bytes 30 through 33 contain any values.

8. Bytes 36 and 37 contain:
 - Decimal 0x01 and 0x3f respectively and the ts_319 bit in the Pn_TS_Ctl_Ltype2 register is set, or
 - Decimal 0x01 and 0x40 respectively and the ts_320 bit in the Pn_TS_Ctl_Ltype2 register is set.
9. The PTP message begins in byte 42.
10. The packet message type is enabled in the ts_msg_type_en field in Pn_TS_Ctl.
11. The packet was received without error (not long/short/mac_ctl/crc/code/align).

9.4.14.1.2 Annex E (IPv6)

1. Receive annex E time sync is enabled (pn_ts_rx_annex_e_en is set in the switch Pn_TS_Ctl register).
2. One of the sequences below is true.
 - The first packet LTYPE matches 0x86dd.
 - The first packet LTYPE matches ts_vlan_ltype1 and ts_rx_vlan_ltype1_en is set and the second packet LTYPE matches 0x86dd.
 - The first packet LTYPE matches ts_vlan_ltype2 and ts_rx_vlan_ltype2_en is set and the second packet LTYPE matches 0x86dd.
 - The first packet LTYPE matches ts_vlan_ltype1 and ts_rx_vlan_ltype1_en is set and the second packet LTYPE matches ts_vlan_ltype2 and ts_rx_vlan_ltype2_en is set and the third packet LTYPE matches 0x86dd.

3. Byte 14 (the byte after the LTYPE) contains 0x6X (IP_VERSION in most significant nibble).
4. Byte 20 contains 0x11 (UDP Fixed Next Header).
5. Byte 21 contains 0x01 (HOP Limit = 1) if the `ts_ttl_nonzero` bit in the switch `Pn_TS_Ctl_LType2` register is zero, or byte 21 contains any value if `ts_ttl_nonzero` is set. Byte 21 is the TTL/HOP field.
6. The `ts_uni_en` bit in the `Pn_TS_Ctl_LType2` register is zero and Bytes 38 through 53 contain:
 - FF0M:0:0:0:0:0:0:0181 and the `ts_129` bit in the `Pn_TS_Ctl_LType2` register is set, or
 - FF0M:0:0:0:0:0:0:0182 and the `ts_130` bit in the `Pn_TS_Ctl_LType2` register is set, or
 - FF0M:0:0:0:0:0:0:0183 and the `ts_131` bit in the `Pn_TS_Ctl_LType2` register is set, or
 - FF0M:0:0:0:0:0:0:0184 and the `ts_132` bit in the `Pn_TS_Ctl_LType2` register is set, or
 - FF0M:0:0:0:0:0:0:006B and the `ts_107` bit in the `Pn_TS_Ctl_LType2` register is set (all values above are 16-bit hex numbers with M is enabled in the `ts_mcast_type_en` field in the `Pn_TS_Ctl2` register).

Or:

The `ts_uni_en` bit in the `Pn_TS_Ctl_LType2` register is set and Bytes 38 through 53 contain any value.

7. Bytes 56 and 57 contain (UDP Header in bytes 54 through 61):
 - Decimal 0x01 and 0x3f respectively and the `ts_319` bit in the `Pn_TS_Ctl_LType2` register is set, or
 - Decimal 0x01 and 0x40 respectively and the `ts_320` bit in the `Pn_TS_Ctl_LType2` register is set.
8. The PTP message begins in byte 62.
9. The packet message type is enabled in the `ts_msg_type_en` field in `Pn_TS_Ctl`.
10. The packet was received without error (not long/short/mac_ctl/crc/code/align).

9.4.14.1.3 Annex F (IEEE 802.3)

1. Receive Annex F time sync is enabled (`ts_rx_annex_f_en` is set in the switch `Pn_TS_Ctl` register).
2. One of the sequences below is true.
 - The first packet LTYPE matches `ts_ltype1`. LTYPE 1 should be used when only one time sync LTYPE is to be enabled.
 - The first packet LTYPE matches `ts_ltype2` and `ts_ltype2_en` is set
 - The first packet LTYPE matches `ts_vlan_ltype1` and `ts_rx_vlan_ltype1_en` is set and the second packet LTYPE matches `pn_ts_ltype1`
 - The first packet LTYPE matches `ts_vlan_ltype1` and `ts_rx_vlan_ltype1_en` is set and the second packet LTYPE matches `ts_ltype2` and `ts_ltype2_en` is set
 - The first packet LTYPE matches `ts_vlan_ltype2` and `ts_rx_vlan_ltype2_en` is set and the second packet LTYPE matches `pn_ts_ltype1`
 - The first packet LTYPE matches `ts_vlan_ltype2` and `ts_rx_vlan_ltype2_en` is set and the second packet LTYPE matches `ts_ltype2` and `ts_ltype2_en` is set
 - The first packet LTYPE matches `ts_vlan_ltype1` and `ts_rx_vlan_ltype1_en` is set and the second packet LTYPE matches `ts_vlan_ltype2` and `ts_tx_vlan_ltype2_en` is set and the third packet LTYPE matches `pn_ts_ltype1`
 - The first packet LTYPE matches `ts_vlan_ltype1` and `ts_rx_vlan_ltype1_en` is set and the second packet LTYPE matches `ts_vlan_ltype2` and `ts_rx_vlan_ltype2_en` is set and the third packet LTYPE matches `ts_ltype2` and `ts_ltype2_en` is set
3. The PTP message begins in the byte after the LTYPE.
4. The packet message type is enabled in the `ts_msg_type_en` field in the `Pn_TS_Ctl` register.
5. The packet was received without error (not long/short/mac_ctl/crc/code/align).

9.4.14.2 1588 Transmit Packet Operation

There are two CPSW transmit time sync interfaces for each Ethernet port. The first is the `TS_TX_DEC` interface and the second is the `TS_TX_MII` interface. Both interfaces are internal to the cpsw and are input to the CPTS module.

The `TS_TX_DEC` function decodes each packet to be transmitted and determines if the packet meets the time sync event packet criteria. If the packet is determined to be a time sync event packet, then the time sync event is signaled to the CPTS controller via the `TS_TX_DEC` interface (`pn_ts_tx_dec_evt`, `pn_ts_tx_dec_hdl[3:0]`, `pn_ts_tx_dec_msg_type[3:0]`, `pn_ts_tx_dec_seq_id[15:0]` and `pn_ts_rx_dec_domain[7:0]`). The event

signal is a single clock pulse indicating that the packet matched the time sync event packet criteria and that the associated packet handle, message type, and sequence ID are valid. The 16-bit sequence ID is found in the time sync event packet at the sequence ID offset into the message header (**pn_ts_seq_id_offset**). The 8-bit domain number is found in the time sync event packet at the domain offset into the PTP message header (**pn_ts_domain_offset**). No indication is given for transmit packets that do not meet the time sync event criteria. The time sync event packet handle is also passed along with the packet to the TS_TX_MII with an indication that the packet is a time sync event packet. Unlike receive; only transmit event packets increment the handle value. The decode function is separated from the record function because some systems may encrypt the packet. The encryption is after the decode function on transmit (egress). A packet is determined to be a transmit event packet under the following conditions.

9.4.14.2.1 Annex D (IPv4)

1. Transmit time sync is enabled (ts_tx_annex_d_en is set in the switch Pn_TS_Ctl register).
2. One of the sequences below is true.
 - The first packet LTYPE matches 0x0800
 - The first packet LTYPE matches ts_vlan_ltype1 and ts_tx_vlan_ltype1_en is set (PN_TS_VLAN_LTYPE register) and the second packet LTYPE matches 0x0800
 - The first packet LTYPE matches ts_vlan_ltype2 and ts_tx_vlan_ltype2_en is set and the second packet LTYPE matches 0x0800
 - The first packet LTYPE matches ts_vlan_ltype1 and ts_tx_vlan_ltype1_en (PN_TS_CTL_REG) is set and the second packet LTYPE matches ts_vlan_ltype2 and ts_tx_vlan_ltype2_en is set and the third packet LTYPE matches 0x0800
3. Byte 14 (the byte after the LTYPE) contains 0x45 (IP_VERSION). Note that the byte numbering assumes that there are no VLANs. The byte number is intended to show the relative order of the bytes. If VLAN(s) are present then the byte numbers push down.
4. Byte 20 contains 0bXXX00000 (5 lower bits zero) and Byte 21 contains 0x00 (fragment offset zero)
5. Byte 22 contains 0x01 (HOP Limit = 1) if the ts_ttl_nonzero bit in the switch Pn_TS_Ctl_LType2 register is zero, or byte 22 contains any value if ts_ttl_nonzero bit is set. Byte 22 is the TTL/HOP field.
6. Byte 23 contains 0x11 (Next Header UDP Fixed).
7. The pn_ts_uni_en bit in the Pn_TS_Ctl_Ltype2 register is zero and bytes 30 through 33 contain:
 - Decimal 224.0.1.129 and the ts_129 bit in the Pn_TS_Ctl_Ltype2 register is set, or
 - Decimal 224.0.1.130 and the ts_130 bit in the Pn_TS_Ctl_Ltype2 register is set, or
 - Decimal 224.0.1.131 and the ts_131 bit in the Pn_TS_Ctl_Ltype2 register is set, or
 - Decimal 224.0.1.132 and the ts_132 bit in the Pn_TS_Ctl_Ltype2 register is set, or
 - Decimal 224.0.0.107 and the ts_107 bit in the Pn_TS_Ctl_Ltype2 register is set

Or:

The ts_uni_en bit in the Pn_TS_Ctl_Ltype2 register is set and Bytes 30 through 33 contain any values.
8. Bytes 36 and 37 contain:
 - Decimal 0x01 and 0x3f respectively and the ts_319 bit in the Pn_TS_CTL_Ltype2 register is set, or
 - Decimal 0x01 and 0x40 respectively and the ts_320 bit in the Pn_TS_CTL_Ltype2 register is set.
9. The PTP message begins in byte 42 (this is offset 0).
10. The packet message type is enabled in ts_msg_type_en field in the Pn_TS_Ctl register.
11. The packet was sent by the host (port 0).

9.4.14.2.2 Annex E (IPv6)

1. Transmit annex E time sync is enabled (ts_tx_annex_e_en is set in the Pn_TS_Ctl register).
2. One of the sequences below is true.
 - The first packet LTYPE matches 0x86dd.
 - The first packet LTYPE matches ts_vlan_ltype1 and ts_tx_vlan_ltype1_en is set and the second packet LTYPE matches 0x86dd.
 - The first packet LTYPE matches ts_vlan_ltype2 and ts_tx_vlan_ltype2_en is set and the second packet LTYPE matches 0x86dd.

There are 8 possible handle values so there can be a maximum of 8 time sync event packets “in flight” from the TS_TX_DEC to the TS_TX_MII block at any given time. The handle value increments only on time sync event packets. The TS_TX_MII logic is in the transmit wireside clock domain.

Note

TS_TX_DEC and TS_TX_MII are internal interfaces that have no registers. They are included for description purposes only.

9.4.15 Rate Limiting (Traffic Shaping) (P802.1Qav/D6.0)

Rate-limit mode is intended to allow some CPPI ingress channels and some Ethernet transmit (switch egress) priorities to be rate-limited. Non rate-limited traffic (bulk traffic) is allowed on lower priority non rate-limited channels and FIFO priorities. Rate-limited traffic must be configured to be sent to rate-limited queues (via packet priority handling). The allocated rates for rate-limited traffic must not be oversubscribed. For example, if port 1 is sending 15% rate limited traffic to port 2 priority 3, and port 0 is also sending 10% rate-limited traffic to port 2 priority 3, then the port 2 priority 3 egress rate must be configured to be 25% plus a percent or two for margin. The switch must be configured to allow some percentage of non rate-limited traffic. Non rate-limited traffic must be configured to be sent to non rate-limited queues. No packets from the host should be dropped, but non rate-limited Ethernet ingress traffic can be dropped. For rate limited priorities, the configured transfer rate includes the committed information rate and the excess information rate. The excess information rate will only be attempted to be sent when there is no packet backlog on every priority that does not have the excess information rate enabled. The committed information rate will be sent regardless of network traffic as long as the configuration is not oversubscribed. The excess information rate will be sent only when network conditions allow.

Credit Based Shaper (CBS)

CBS based traffic shaping is supported in the CPSW IP and can be enabled by either configuring it in the **committed information rate** register either in the CPPI port ingress or in the Ethernet port transmit. If the rate limiting is applied at the CPPI port ingress, then the CPDMA makes sure to transmit the data at the limited rate. If it is configured at the Ethernet port end the burst data may be buffered in the Ethernet FIFO before transmitting, care must be taken such that Ethernet FIFO does not overflow when rate limiting is set in Ethernet port.

The relation between CBS parameters and hardware register configuration is as follows:

- idleSlope is essentially the rate limit, i.e. $\text{idleSlope} = \text{CIR}$ (committed information rate) in Mbps
- portTransmitRate is link speed or port speed which is 100Mbps in AWR2944
- sendSlope is calculated as, $\text{sendSlope} = \text{idleSlope} - \text{portTransmitRate}$ (this is described in the spec)
- hicredit and locredit : credit is calculated based on the idleSlope and sendSlope, it is maintained internally in the hardware, this is not a configurable parameter to the user.

9.4.15.1 CPPI Port Ingress Rate Limiting

Port 0 FHost operations can be configured to rate limit the packet data for each channel (priority). FHost has 8 priorities for QOS. There is a committed information rate (**P0_Pri_CIR**) and an excess information rate for each priority (**P0_Pri_EIR**). Rate limiting is enabled for a priority when the committed information rate for the priority is non-zero. The excess information rate for a priority is enabled when the excess information rate for the priority is non-zero. The committed information rate must be non-zero if the excess information rate is configured to be non-zero. That is, there must be a configured non-zero committed information rate for there to be a configured non-zero excess information rate. Bulk traffic on other non-rate limited priorities does not impact the committed information traffic on a priority. However, bulk traffic on other non-rate limited priorities does impact the excess information rates. No bulk priority will be enabled to send unless there are **tx_host_blks_rem** number of unused blocks remaining in each of the Ethernet port transmit FIFOs. The “blocks remaining check” ensures that bulk traffic from the host will not block rate-limited traffic from the host. Rate limited channels must be the highest priority channels. For example, if two rate limited channels are required then priorities 7 and 6 should be configured for committed information (and excess information if desired). When any channels are configured to be rate-limited, the ingress priority type must be fixed. Round-robin priority type is not allowed when rate-limiting is configured for any priority. The configured transfer rate includes the inter-packet gap (12

bytes) and the preamble (8 bytes). The rate in Mbits/second for each priority is controlled by the below equation. If the configured excess information rate is zero, then only the committed information rate is transferred:

$$\text{Priority Transfer rate in Mbit/s} = \left(\left(\left(\text{Frequency in MHZ} \right) * \mathbf{P0_Pri_CIR} \right) / 32768 \right) + \left(\left(\left(\text{Frequency in MHZ} \right) * \mathbf{P0_PriX_EIR} \right) / 32768 \right)$$

Where the frequency is the **VBUSP_GCLK** frequency (350 for 350Mhz) and priX = pri0 to pri7. For example, 10Mbps on priority 7 would give the below:

$$10\text{Mbps} = \sim \left(\left(\left(350 * 936 \right) / 32768 \right) \right), \text{ at } 350\text{Mhz} \text{ and } \mathbf{p0_pri7_cir} \text{ value} = 936 \text{ (no excess information rate)}$$

9.4.15.2 Ethernet Port Transmit Rate Limiting

Ethernet port transmit operations can be configured to rate limit egress data for each egress priority. There is a committed information rate (**Pn_PriX_CIR**) and an excess information rate for each priority (**Pn_PriX_EIR**). Rate limiting is enabled for a priority when the committed information rate for the priority is non-zero. The excess information rate for a priority is enabled when the excess information rate for the priority is non-zero. The committed information rate must be non-zero if the excess information rate is configured to be non-zero. That is, there must be a configured non-zero committed information rate for there to be a configured non-zero excess information rate. Bulk traffic on other non-rate limited priorities does not impact the committed information traffic on a priority. However, bulk traffic on other non-rate limited priorities does impact the excess information rates. Rate limited channels must be the highest priority channels. For example, if two rate limited channels are required then priorities 7 and 6 should be configured for committed information (and excess information if desired). The configured transfer rate includes the inter-packet gap (12 bytes) and the preamble (8 bytes). The rate in Mbits/second that each priority is configured to send is controlled by the below equation. If the excess information rate is disabled then the committed information rate only is transferred:

$$\text{Priority Transfer rate in Mbit/s} = \left(\left(\left(\text{Frequency in MHZ} \right) * \mathbf{Pn_PriX_CIR} \right) / 32768 \right) + \left(\left(\left(\text{Frequency in MHZ} \right) * \mathbf{Pn_PriX_EIR} \right) / 32768 \right)$$

Where the frequency is the **VBUSP_GCLK** frequency (350 for 350Mhz) and priX = pri0 to pri7. For example, 100Mbps on priority 7 would give the below:

$$100\text{Mbps} = \sim \left(\left(\left(350 * 9360 \right) / 32768 \right) \right), \text{ at } 350\text{Mhz} \text{ and } \mathbf{pn_pri7_cir} \text{ value} = 9360, \text{ with no excess information rate.}$$

9.4.16 Transmit Priority Escalation

Bulk (non rate limited) traffic can be escalated in order to preclude starvation of lower bulk traffic priorities from higher bulk traffic priorities. Escalation is configured and enabled in the **PTYPE** register with the **pn_ptype_esc** and **esc_pri_id_val** fields. Escalation can be enabled with rate limited priorities. The rate limited priorities are on the upper priorities starting with priority 7 and going down (consecutively), and therefore, the escalated priorities are on the lower bulk priorities.

9.4.17 Enhanced Scheduled Traffic (EST – P802.1Qbv/D2.2)

9.4.17.1 EST Overview

- When enabled and configured, EST allows express queue traffic to be scheduled (placed) on the wire at specific repeatable time intervals.
- EST operates on a repeating time interval generated by the CPTS EST function generator. For example, a 125us repeating time interval can be configured.
- Each Ethernet port has 128 EST fetch commands maximum in the global EST fetch RAM.
- Each 22-bit fetch command consists of a 14-bit fetch count (14 msb's) and an 8-bit priority fetch allow (8 lsb's) that will be applied for the fetch count time in wireside clocks.
- The configured port fetch commands are executed in sequence, beginning at port address zero each time through the time interval beginning at cycle start.

- EST allows non-scheduled express and preempt queue traffic to be cleared from the wire to ensure that the scheduled traffic is transmitted at the proper time (wire clear is performed with zero allow).
- EST can be used with or without preemption. The `pn_mac_preempt[7:0]` value determines whether the priority is enabled on the express or preempt queue. Whether a priority is on the express or preempt queue only effects the wire clear time from an EST operation perspective.
- Software should not move priorities to the preempt queue unless preemption is configured, enabled, and verified - allowing preemption to occur.
- Express packet time stamp events can be enabled to assist software in configuring and timing EST operations.

9.4.17.2 EST Fetch RAM

- The EST fetch RAM is read/write in the CPSW configuration address space.
- Each Ethernet transmit port has 128 locations in the global EST fetch RAM.
 - Ethernet port 1 has EST fetch RAM addresses 0x000-0x1ff.
 - Ethernet port 2 has EST fetch RAM addresses 0x200-0x3ff, and so on.
- One buffer operation – When `est_onebuf` is set, the 128 port locations operate as one buffer. The `est_bufact` bit in `Pn_FIFO_Status` is the upper address bit of the port's fetch RAM address indicating whether operation is currently in the upper or lower 64 locations of the port's fetch RAM.
- Two buffer operation - When `est_onebuf` of `PN_EST_CONTROL` register is cleared there are two 64-location buffers with `est_bufsel` selecting the buffer to be used. When the buffer is switched by changing the `est_bufsel` value, the actual switch occurs on cycle start. The actual buffer being used is indicated by the `est_bufact` bit in `Pn_FIFO_Status`. Software should avoid writing the switched out buffer fetch RAM locations until it detects that the actual switch has occurred.
- The first address location in the port's fetch RAM space (location zero) is read at the beginning of each EST time interval (cycle start). Addresses are then read in ascending order for the duration of the interval. The port's address zero location is then read again at the beginning of the next cycle repeating the time interval packet operations.

9.4.17.3 EST Time Interval

- Each Ethernet port has an EST function (ESTF) generator in the CPTS submodule.
- The EST function generator generates the EST time interval as a configured number of CPTS reference clocks (`CPTS_RCLK`).
- The EST function generator rising edge is the cycle start time and the cycle repeats (cycle start occurs) after every time interval.
- The first fetch allow (8 lsb's of the fetch command from the EST fetch RAM) value is at the port's base address zero in the EST fetch RAM and is actually applied 16 wireside clocks after cycle start. The 16 clock delay allows the first fetch value to be fetched from the EST fetch RAM (prefetch time at cycle start).
- Each successive fetch allow is applied for the associated fetch count thereafter. The minimum non-zero fetch count is 16. The minimum value of 16 guarantees that the next fetch value has time to be fetched before the current fetch count is over. There are 64 maximum fetch values when `est_onebuf=0`, and 128 maximum fetch values when `est_onebuf=1`.
- The next cycle start then causes the fetch to once again start at the port's address zero location.

9.4.17.4 EST Fetch Values

- The 22-bit fetch value is made up of the 14-bit fetch count and the 8-bit fetch allow.
- The fetch time indicates the number of wireside clocks that the fetch allow will be active.
- The fetch count is in Ethernet wireside clocks which is bytes in gigabit mode (`pn_gig=1`) and nibbles in 10/100Mbps mode.
- When a fetch allow bit is set, the corresponding priority is enabled to begin packet transmission on an allowed priority subject to rate limiting. There is no requirement that the packet end in the time interval. The actual packet transmission on the wire may carry over into the next fetch count - which is the reason for the wire clear time in a fetch zero allow.

- When a fetch allow bit is cleared, the corresponding priority is not enabled to transmit for the fetch count time. However, if a packet were enabled in a previous fetch allow there the packet could finish in the current time interval.
- A non-zero fetch allow value with a non-zero fetch count causes the fetch allow value to be applied for the fetch count number of wireside clocks (minimum of 16 fetch count).
- A zero fetch count causes the associated fetch allow to be held for the duration of the cycle (until the next cycle start).
- A zero fetch allow with a non-zero fetch count is intended to clear the wire for a scheduled (timed) express packet in the next fetch. A zero fetch allow indicates that no packet can be started for transmission for the associated fetch count. However, packets that were started in the previous interval could still be on the wire. The associated fetch count must be sufficient to guarantee that the wire is cleared given that a packet on an allowed priority in the previous fetch could have been started on the previous clock and that there is hardware latency in the clear time. The timed packet should be sent on a priority that is enabled in the next fetch but disabled in the current zero allow fetch.
- EST Ram Configuration – The simplest EST configuration is for a single express packet on a single priority in the EST time interval. Ram Address 0 will be read at the start of each interval, the timed packet goes out in Ram Address 1 interval, and Ram Address 2 priorities are held for the duration of the cycle in this simple configuration.
 - Ram Address 0 – 0xD0000 (10/100 with 1518 max pkt length in previous allow)
 - This is a zero allow at the beginning of each cycle which clears the wire for the timed express packet in the next fetch. The zero allow time (0xD00 in this case) allows the wire to be cleared for the express packet. Setting this value lower might push out the timed express packet into the next interval. For a 2020 max packet size in the previous allow, this value should be 0x10F400. The number of clocks required for the zero allow is determined by the below equation.
 - Clocks in zero allow = Maximum **Express** packet length in previous allow (times 2 for 10/100) + decimal 292. (If preemption is configured and enabled then this minimum time is 0x100 if only preempt priorities are in the previous allow – which is not a normal case).
 - Ram Address 1 – 0x01080
 - This is a decimal 16 clock allow for the timed express packet on priority 7. The 16 clock allow value permits only a single packet to start in the time interval.
 - Ram Address 2 – 0x0007F
 - This is a zero fetch count that allows priorities 6 down to 0 for the duration of the EST time interval. This is the previous allow for the zero allow in Address 0 above.

9.4.17.5 EST Packet Fill

- Packet fill can (should) be configured and enabled to occur in the fetch count time associated with a fetched zero allow that precedes a timed express packet. The intention with fill is that a smaller packet on a non-timed priority might be able to be inserted on the wire during the wire clear time which would increase wire utilization. Fill must be configured to ensure that any fill packet does not conflict with the timed express packet allowed in the next fetch. Incorrect configuration might push out in time any express timed packet which indicates that the fill margin needs to be increased.
- Fill Configuration
 - The est_fill_margin value in Pn_EST_Control should be written with a 0x100 value.
 - The est_preempt_comp value in Pn_EST_Control should be written with a 0x12 value (if IET is to be configured and enabled). This value times eight is the number of wireside clocks required to clear preempt packets off the wire at the end of a zero allow.
 - The est_fill_en bit in Pn_EST_Control should be set.

9.4.17.6 EST Time Stamp

- EST can be configured to generate CPTS timestamp events for selected express traffic.
- EST timestamp events use the CPTS host event type (event_type=7). EST timestamps will not override host sent timestamps for packets that were sent from the host with an enabled host timestamp.
- EST Events (host events EVENT_n_REG) contain the below information:
 - Time Stamp of the selected express packet.

- The event port_number indicates the transmit port number.
- The event event_type is decimal 7 (host event).
- The event message_type indicates the packet transmit hardware switch priority.
- The event sequence_id upper nibble indicates the packet receive port number.
- The event sequence_id lower byte indicates the sequence number of the express packet in numerical order. The first event is event one, the second is event two and so on. The sequence id rolls over to zero after 0xff (8-bits).
- The event domain is the value from the est_ts_domain[8:0] register.
- When est_ts_en is set, timestamp events will be generated on selected express traffic.
- When est_ts_first is also set, events will be generated only on the first express packet in each time interval. If est_ts_onepri is also set then the event will only be on the first est_ts_pri express packet in the time interval. If est_ts_onepri is clear then the event will be generated on the first express packet in the time interval on any priority.
- When est_ts_first is clear, events will be generated on every express packet. If est_ts_onepri is set then the event will be generated on every est_ts_pri express packet. If est_ts_onepri is clear then event will be generated on every express packet on any priority.

9.4.17.7 EST Packets Per Priority – (N = 2 only)

With a MAC configuration (N = 2), the number of packets allowed in a transmit FIFO priority can be selected by writing a non-zero value to **p0_rx_pkts_pri[7:0]**. The port 0 receive gap should then be enabled by setting the corresponding priority **rx_gap_en[7:0]**. The receive gap allows a packet to land in the transmit FIFO before another packet is allowed in which guarantees that only the selected number (max) of packets is allowed in on the specified priority. If the receive gap is not enabled, then there might be one or two more packets allowed in on the priority than the **p0_rx_pkt_pri[7:0]** value has selected.

9.4.18 DSCP

The ALE can map DSCP field to priority prior to port trunking hashing and policing/classification matching. When enabled the DSCP is mapped via 64 priority entries such that any DSCP value can be mapped to any of the eight priorities. When a packet is received without a VLAN priority this remapped priority can be used instead of the default Port VLAN priority field. See the Switch Port configuration for the registers describing DSCP mapping.

9.4.19 Packet Priority Handling

There are three priorities used inside the CPSW - the packet priority, the header packet priority, and the switch priority. The packet priority is the determined priority of the ingress packet. The header packet priority is used as the outgoing VLAN priority if the packet is egressing from the switch with a VLAN tag. The switch priority determines which of the eight FIFO priority queues the packet uses during egress.

The **vlan_ltype_sel** value below is selected by the **s_cn_switch** bit in the **CPSW_Control** register and is either the **vlan_ltype_inner** (0x8100 default) or **vlan_ltype_outer** (0x88a8 default) value.

9.4.19.1 Ethernet Port Ingress

Ethernet ingress packets have an ingress packet priority of 0 to 7 (with 7 being the highest priority). The packet priority is determined as follows:

1. If the first packet LTYPE = **vlan_ltype_sel** then the ingress packet priority is the packet priority (VLAN tagged and priority tagged packets).
2. Else if the first packet LTYPE = 0x0800 and byte 14 (following the LTYPE) is equal to 0x4X, and **dscp_ipv4_en** is set in **Pn_Control**, then the ingress packet priority is the 6-bit TOS field in byte 15 (upper 6-bits) mapped through the port's DSCP priority mapping registers (IPv4 packet).
3. Else if the first packet LTYPE = 0x86dd and the most significant nibble of byte 14 (following the LTYPE) is equal to 0x6, and **dscp_ipv6_en** is set in **Pn_Control**, then the ingress packet priority is the 6-bit priority (in the 6-bits following the upper nibble 0x6) mapped through the port's DSCP priority mapping registers (IPv6 packet).

4. Else the ingress packet priority is the source (ingress) port priority taken from the port's Pn_Port_VLAN register.

The packet priority is mapped through the ingress port's associated "packet priority to header packet priority mapping register" (**pn_rx_pri_map**) to obtain the header packet priority (**hdr_pkt_pri**). The header packet priority is then used as the actual transmit packet priority if the VLAN information is to be sent on egress. The header packet priority is mapped at each destination FIFO through the **pn_tx_pri_map** register (header priority to switch priority mapping register) to obtain the hardware switch priority (hardware queue 0 through 7).

9.4.19.2 CPPI Port FHost (Ingress)

FHost packets have a packet priority (0 to 7 with 7 being the highest priority). The FHost packet priority is determined as follows:

1. If the first packet LTYPE = vlan_ltype_sel then the FHost packet priority is the packet priority (VLAN tagged and priority tagged packets).
2. Else if the first packet LTYPE = 0x0800 and byte 14 (following the LTYPE) is equal to 0x4X, and p0_dscp_ipv4_en is set in P0_Control, then the FHost packet priority is the 6-bit TOS field in byte 15 (upper 6-bits) mapped through the port's DSCP priority mapping registers (IPV4 packet).
3. Else if the first packet LTYPE = 0x86dd and the most significant nibble of byte 14 (following the LTYPE) is equal to 0x6, and dscp_ipv6_en is set in P0_Control, then the FHost packet priority is the 6-bit priority (in the 6-bits following the upper nibble 0x6) mapped through the port's DSCP priority mapping registers (IPV6 packet).
4. Else the FHost packet priority is the source port priority taken from P0_Port_VLAN.

The ingress packet priority is mapped through the port's associated "packet priority to header packet priority mapping register" (**p0_rx_pri_map**) to obtain the header packet priority. The header packet priority is then used as the actual transmit packet priority if the VLAN information is to be sent on egress.

For CPPI FHost packets, the destination port hardware switch priority is the below selected value remapped through **p0_rx_pri_map**:

1. If the FHost packet is priority tagged or vlan tagged:
 - If rx_remap_vlan is clear then the destination hardware switch priority is the CPPI FHost channel number.
 - If rx_remap_vlan is set then the destination hardware switch priority is the packet priority value. Port transmit remapping (Pn_Tx_Pri_Map should remain the default value) is not compatible with this bit being set, but remapping can be configured on port 0 FHost. If N=2 (two port MAC) remapping should be done only on ingress for Ethernet and CPPI.
2. Else if the ingress packet has the first packet LTYPE = 0x0800 and byte 14 (following the LTYPE) is equal to 0x4X, and **dscp_ipv4_en** is set in **P0_Control**:
 - If rx_remap_dscp_v4 is clear then the destination hardware switch priority is the CPPI ingress priority.
 - If rx_remap_dscp_v4 is set then the destination hardware switch priority is the 6-bit TOS field in byte 15 (upper 6-bits) mapped through the port's DSCP priority mapping registers (IPV4 packet). Port 1 transmit remapping (Pn_Tx_Pri_Map should remain the default value) is not compatible with this bit being set, but remapping can be configured on port 0 ingress. If N=2 (two port MAC) remapping should be done only on ingress for Ethernet and CPPI.
3. Else if the ingress packet has the first packet LTYPE = 0x86dd and the most significant nibble of byte 14 (following the LTYPE) is equal to 0x6, and **dscp_ipv6_en** is set in **CPPI_P0_Control**:
 - If rx_remap_dscp_v6 is clear then the destination hardware switch priority is the CPPI ingress priority.
 - If rx_remap_dscp_v6 is set then the destination hardware switch priority is the 6-bit priority (in the 6-bits following the upper nibble 0x6) mapped through the port's DSCP priority mapping registers (IPV6 packet). Port 1 transmit remapping (Pn_Tx_Pri_Map should remain the default value) is not compatible with this bit being set, but remapping can be configured on port 0 ingress. If N=2 (two port MAC) remapping should be done only on ingress for Ethernet and CPPI.
4. Else the ingress packet is non-tagged and the destination hardware switch priority is the CPPI ingress channel number.

9.4.19.3 CPPI Port THost (Egress)

If the **thost_ch_override** bit in **CPDMA_Control** is clear then the CPDMA packet THost channel number is the port 0 hardware switch priority. If **thost_ch_override** is set, then for packets with a classification match the THost channel number is the lower three bits of the 6-bit address lookup engine classification match value (**threadval[2:0]** in ALE register **THREADMAPVAL**). The **flow** value in the VLAN encapsulation word is all 6 bits of the **threadval** for classifier matches regardless of the setting of **thost_ch_override** if the encapsulation word is transferred.

9.4.20 Packet CRC Handling

Every cpsw ingress packet on all ports is checked for CRC correctness. Each packet is then given an internally generated Castignoli CRC for transport through the cpsw to egress port(s). The internally generated Castignoli CRC protects the packet from end to end through the cpsw. Ingress Packets with CRC errors are handled as indicated below.

9.4.20.1 Ethernet Port Ingress

Ethernet ports check each ingress packet CRC for correctness in all modes/speeds. The port can check for either Ethernet CRC for correctness as determined by the **crc_type** bit in the **Mac_Control** register. Ethernet packets received with a CRC error are dropped at the receive port unless the receive port **rx_cef_en** bit is set. Error packets are sent only to the host port. For packets with Ethernet ingress errors sent to the host, the error is indicated in the host egress buffer descriptor and the original packet CRC bytes are kept for CPDMA THost.

9.4.20.2 Ethernet Port Egress

Ethernet ports transmit egress packets with the CRC type selected by the **crc_type** bit in the **Pn_Mac_Control** register regardless of the packet's ingress CRC type. On Ethernet egress, after passing through the switch, the internally generated Castignoli CRC is checked for correctness and if correct the packet is output with the generated selected output CRC type. If the internally generated CRC is incorrect, due either to a bit flip in a memory (or logic) or an error CRC passed in on host ingress, then the generated egress CRC type is used with at least a single byte of the internally generated Castignoli CRC inverted to indicate the error. If the packet length including CRC is divisible by 4 then all 4 CRC bytes will be inverted on error. If there are three bytes remainder after dividing the packet length by 4 then three bytes will be inverted (and so on down to one byte remainder).

9.4.20.3 CPPI Port FHost

CPPI host port FHost packets can be passed in with or without a CRC. The FHost packet CRC type is indicated in the buffer descriptor word **crc_type** bit and can be Ethernet. The **p0_rx_pass_crc_err** bit in the **CPSW_Control** register determines if FHost packets with CRC errors are passed or dropped. Passed packets with CRC errors will be transmitted on Ethernet egress with a CRC error.

9.4.20.4 CPPI Port Egress (THost)

The **p0_tx_crc_remove** bit in the **CPSW_Control** register determines if all CPPI THost packets have a CRC included or not. THost packets not filtered on Ethernet ingress due to **pn_rx_cef_en** have the packet error CRC included (not replaced by the egress CRC type) if the CRC is not removed on egress. The error is indicated in the buffer descriptor. CPPI THost packets that detected a CRC error on the internally generated Castignoli CRC, due to a bit flip in logic or memory, will indicate the error with the **drop** bit set in the buffer descriptor.

9.4.21 Ethernet FIFO

Each transmit packet FIFO contains eight logical transmit queues (priority 0 through 7 with 7 the highest priority) regardless of the memory configuration. The receive logical FIFO is combined with the transmit logical FIFO into the same RAM instance. The receive FIFO is used for single packet reception and error detection and flow control runout. Packets are queued on transmit. Ethernet FIFO size is 20 KBytes.

9.4.22 Ethernet Receive Flow Control

When enabled and triggered, receive flow control is initiated to limit the Mac from further frame reception. Half-duplex mode receive flow control is collision based while full duplex mode issues 802.3X or Priority Based Flow Control (PFC) pause frames. In all cases, receive flow control prevents frame reception by issuing the flow

control appropriate for the current mode of operation. Receive flow control is enabled by the **rx_flow_en** bit in the **Pn_Mac_Control** register, and **rx_flow_pri[7:0]** in **Pn_Pri_Ctl**. For 10/100 modes of operation, collision or IEEE 802.3X flow control is determined via the **fullduplex** bit in the **Pn_Mac_Control** register. The **fullduplex** bit must be set for Priority Based Flow Control.

9.4.22.1 MII (10/100) Collision Based Receive Buffer Flow Control

Collision-based receive buffer flow control provides a means of preventing frame reception when the port is operating in half-duplex mode (**fullduplex** is cleared in **Pn_Mac_Control**). When receive flow control is enabled and triggered, the port will generate collisions for received frames. The jam sequence transmitted will be the twelve byte sequence C3.C3.C3.C3.C3.C3.C3.C3.C3.C3.C3.C3 (hex). The jam sequence will begin no later than approximately as the source address starts to be received. Note that these forced collisions will not be limited to a maximum of 16 consecutive collisions, and are independent of the normal back-off algorithm. Receive flow control does not depend on the value of the incoming frame destination address. A collision will be generated for any incoming packet, regardless of the destination address.

9.4.22.2 IEEE 802.3X (10/100/1G/10G) Receive Flow Control

IEEE 802.3x based receive flow control provides a means of preventing frame reception when the port is operating in full-duplex mode (**fullduplex** is set in **Pn_Mac_Control**). When receive flow control is enabled and triggered, the port will transmit a pause frame to request that the sending station stop transmitting for the period indicated within the transmitted pause frame.

The Mac will transmit a pause frame to the reserved multicast address at the first available opportunity (immediately if currently idle, or following the completion of the frame currently being transmitted). The pause frame will contain the maximum possible value for the pause time (0xFFFF). The MAC will count the receive pause frame time (decrements 0xFF00 down to zero) and retransmit an outgoing pause frame if the count reaches zero. When the flow control request is removed, the MAC will transmit a pause frame with a zero pause time to cancel the pause request.

Note that transmitted pause frames are only a request to the other end station to stop transmitting. Frames that are received during the pause interval will be received normally (provided the Rx FIFO is not full at which time the receive FIFO will overrun and **Rx_Top_Of_FIFO_Drop** will increment).

Pause frames will be transmitted if enabled and triggered regardless of whether or not the port is observing the pause time period from an incoming pause frame.

The Mac will transmit pause frames as described below:

- The 48-bit reserved multicast destination address 01.80.C2.00.00.01.
- The 48-bit source address – Pn_SA(47:0) (PN_SA_L, PN_SA_H registers).
- The 16-bit length/type field containing the value 88.08
- The 16-bit pause opcode equal to 00.01
- The 16-bit pause time value FF.FF. A pause-quantum is 512 bit-times. Pause frames sent to cancel a pause request will have a pause time value of 00.00.
- Zero padding to 64-byte packet length (The MAC will transmit only 64 byte pause frames).
- The 32-bit frame-check sequence (CRC word).

All quantities above are hexadecimal and are transmitted most-significant byte first. The least-significant bit is transferred first in each byte.

If **rx_flow_en** is cleared to zero while the pause time is nonzero, then the pause time will be cleared to zero and a zero count pause frame will be sent.

9.4.22.2.1 Flow Control Trigger

Receive flow control is triggered (when enabled), when the number of words in the receive FIFO is greater than or equal to **rx_flow_thresh**. The flow control packet runout is then contained in the remainder of the receive FIFO.

9.4.22.3 Ethernet Transmit Flow Control

9.4.22.3.1 IEEE 802.3X (10/100/1G/10G) Based Transmit Flow Control

Incoming pause frames are acted upon, when enabled, to prevent the Mac from transmitting any further frames. Incoming pause frames are only acted upon when the **fullduplex** and **tx_flow_en** bits in the **Pn_Mac_Control** register are set. Pause frames are not acted upon in half-duplex mode. Pause frame action will be taken if enabled, but normally the frame will be filtered and not transferred to memory. MAC control frames will be transferred to memory if the **rx_cmf_en** (Copy MAC Frames) bit in the **Pn_Mac_Control** register is set. The **tx_flow_en** and **fullduplex** bits effect whether or not MAC control frames are acted upon, but they have no effect upon whether or not MAC control frames are transferred to memory or filtered.

Pause frames are a subset of MAC Control Frames with an opcode field=0x0001. Incoming pause frames will only be acted upon by the port if:

- tx_flow_en is set in Pn_Mac_Control, and
- the frame's length is 64 to rx_maxlen bytes inclusive, and
- the frame contains no crc error or align/code errors.

The pause time value from valid frames will be extracted from the two bytes following the opcode. The pause time will be loaded into the port's transmit pause timer and the transmit pause time period will begin.

If a valid pause frame is received during the transmit pause time period of a previous transmit pause frame then:

- if the destination address is not equal to the reserved multicast address or any enabled or disabled unicast address, then the transmit pause timer will immediately expire, or
- if the new pause time value is zero then the transmit pause timer will immediately expire, else
- the port transmit pause timer will immediately be set to the new pause frame pause time value. (Any remaining pause time from the previous pause frame will be discarded).

If **tx_flow_en** in **Pn_Mac_Control** is cleared, then the pause-timer will immediately expire.

The port will not start the transmission of a new data frame any sooner than 512-bit times after a pause frame with a non-zero pause time has finished being received (**MRXDV** going inactive). No transmission will begin until the pause timer has expired (the port may transmit pause frames in order to initiate outgoing flow control). Any frame already in transmission when a pause frame is received will be completed and unaffected.

Incoming pause frames consist of the below:

- A 48-bit destination address equal to:
 - The reserved multicast destination address 01.80.C2.00.00.01, or
 - The Enet_Pn_SA[47:0] input mac source address.
- The 48-bit source address of the transmitting device.
- The 16-bit length/type field containing the value 88.08
- The 16-bit pause opcode equal to 00.01
- The 16-bit pause_time. A pause-quantum is 512 bit-times.
- Padding to 64-byte packet length.
- The 32-bit frame-check sequence (CRC word).

All quantities above are hexadecimal and are transmitted most-significant byte first. The least-significant bit is transferred first in each byte.

The padding is required to make up the frame to a minimum of 64 bytes. The standard allows pause frames longer than 64 bytes to be discarded or interpreted as valid pause frames. The MAC will recognize any pause frame between 64 bytes and **rx_maxlen** bytes in length.

9.4.23 Energy Efficient Ethernet Support (802.3az)

Energy Efficient Ethernet (EEE) allows the external clock controller to turn off (in a glitch-less manner) the module input clock (**CLK**) during inactive periods as determined by network and host traffic. The module can then be awakened by host queued transmit packet(s) or by a port's external Ethernet PHY. The module EEE clock stop interface is used by the external controller to control module EEE operations. EEE is supported

in MII/GMII/RGMII but not RMII, The chosen PHY must also support EEE. EEE operations are configured as shown below:

1. The 12-bit EEE clock pre-scale value is written to the switch EEE_Prescale register. The pre-scaler is used to clock all EEE related counters.
2. The port Idle to LPI count values (Pn_Idle2LPI) are written with the desired values.
3. The port LPI to Wake count values (Pn_LPI2Wake) are written with the desired values.
4. The eee_en bit is set in the switch CPSW_Control register.

Energy Efficient Ethernet operation can begin after configuration. The host allows the module to enter a low power state by asserting the **CLKSTOP_REQ** signal. There are no requirements on host queues or traffic in order for the host to assert or de-assert **CLKSTOP_REQ**.

Each Ethernet port has a transmit and a receive LPI (low power indicate) state. The receive LPI state is entered when the port's corresponding PHY indicates the LPI state via the MII/RGMII interface. The PHY indicates LPI by asserting **GMII_MRXR_SEL** with a **GMII_MRXD[7:0]** value of 0x01 while **GMII_MRXDV** is deasserted (inter-packet gap). The Ethernet transmit port indicates LPI after the **PX_Idle2LPI** value has been counted (the transmit port has gone idle for the configured amount of time). If another packet is received for transmit during the count then the count is restarted. When the transmit port has been idle for the Idle to LPI time, the transmit port enters the LPI state and indicates LPI to the associated PHY. The LPI is indicated to the external PHY by an asserted **GMII_MTXER** with a **GMII_MTXD[7:0]** value of 0x01. while **GMII_MTXEN** is deasserted (inter-packet gap). The CPPI LPI state includes transmit and receive. The CPPI LPI state is entered when the CPPI transmit and receive interfaces have both been idle for the Idle to LPI time (**PO_Idle2LPI**). The Idle to LPI time value for all ports must be large relative to the switch latency to ensure that the count is not able to complete between successive packets.

When all transmit and receive ports are in the LPI state (CPSW LPI state), the **CLKSTOP_ACK** signal is asserted, and the external clock controller is allowed to stop the input module clock (**CLK**). The clock must be stopped (and re-started) in a glitch-less manner. When **CLKSTOP_ACK** is asserted, the clock may be turned on and off as desired by the host. The host is allowed to restart the clock, perform slave read/write operations to the module memory address space, and then turn off the clock again while **CLKSTOP_ACK** is asserted. The clock must be restarted for two clock periods before the assertion of **SLV_VBUSB_REQ** and must remain asserted for five clock periods after the de-assertion of **SLV_VBUSB_REQ**.

The host can remove and disable from re-entering the CPSW LPI state by restarting the module clock (in a glitch-less manner) and then de-asserting **CLKSTOP_REQ**. There must be at least one rising edge of the clock before **CLKSTOP_REQ** is de-asserted. The module **CLKSTOP_ACK** output signal will be deasserted on the clock after the de-assertion of **CLKSTOP_REQ**. The host may queue CPPI receive packets at any time without regard to the module LPI state. The Host must deassert **CLKSTOP_REQ** on wakeup for a minimum of two clock periods. If **CLKSTOP_REQ** is deasserted for less than 5 clock periods for a wakeup event from the host to a particular Ethernet port (or visa versa), then the wakeup event will not cause the other Ethernet ports to awaken.

The external Ethernet PHY's can also wakeup the external clock controller by removing the Ethernet receive LPI indication. If the module is in the CPSW Idle state with **CLKSTOP_ACK** asserted and the receive LPI indication is removed, the **CLKSTOP_WAKEUP** signal will be asynchronously asserted. On wakeup, the external clock controller must restart the clock and de-assert the **CLKSTOP_REQ** signal. The **CLKSTOP_WAKEUP** signal will be synchronously deasserted with **CLKSTOP_ACK**. There must be at least one positive edge of the clock before the **CLKSTOP_REQ** signal is deasserted. Upon the de-assertion of **CLKSTOP_REQ**, the Ethernet ports will count the **Pn_LPI2Wake** time for each port at which time the port is available for transmit.

9.4.24 Switch Latency

When the CPSW is configured as a store and forward switch, the switch latency is defined as the amount of time between the end of packet reception of the received packet to the start of the output packet transmit. The store and forward latency is shown in the below table:

Mode	Latency
Gig (1000)	880ns

Mode	Latency
100	1.3us
10	6.5us

9.4.25 Emulation Control

The emulation control input (**EMUSUSP**), emulation control register, and the submodule emulation control registers allow CPSW operation to be completely or partially suspended. The CPDMA Host port and each Ethernet port has associated emulation control registers. The submodule emulation control registers must be accessed to facilitate CPSW emulation control. The CPSW module enters the emulation suspend state if the switch level emulation control register and all submodules are configured for emulation suspend and the emulation suspend input is asserted. A partial emulation suspend state is entered if one or more submodules is configured for emulation suspend and the emulation suspend input is asserted. Emulation suspend occurs at packet boundaries. The emulation control feature is implemented for compatibility with other peripherals. The following table shows the operation of the emulation control input and register bits:

EMUSUSP	soft	free	Description
0	X	X	Normal Operation
1	0	0	Normal Operation
1	1	0	Emulation Suspend
1	X	1	Normal Operation

Note

Enable Suspend control (EMUSUSP) by MSS_CTRL: MSS_DBG_ACK_CTL0[26:24]

9.4.26 Software IDLE

The software idle register bits enable switch operation to be completely or partially suspended by software control. Each Ethernet port may be individually commanded to enter the idle state. The idle state is entered at packet boundaries, and no further packet operations will occur on an idled port until the idle command is removed. The CPSW software idle inhibits packets from starting to be unloaded from each port switch FIFO, but packets already in process are unaffected.

9.4.27 Common Platform Time Sync (CPTS)

The Common Platform Time Sync (CPTS) module is used to facilitate host control of time sync operations. It enables compliance with the IEEE 1588 standard for a precision clock synchronization protocol.

Main features of CPTS module are:

- Supports the selection of up to 32 external clock sources.
- Software control of time sync events via interrupt or polling.
- Supports 8 hardware timestamp push inputs.
- Supports timestamp counter compare output (TS_COMP).
- Supports timestamp counter bit output (TS_SYNC).
- Supports a configurable number of timestamp Generator bit outputs (TS_GENFn).
- Supports Ethernet Enhanced Scheduled Traffic Operations (TS_ESTFn).
- 64-bit timestamp mode with PPM and nudge adjustment.

9.4.27.1 CPTS Integration

This section describes CPTS module integration in the device, including information about clocks, resets, and hardware requests.

Figure 9-7 shows CPTS integration in the device.

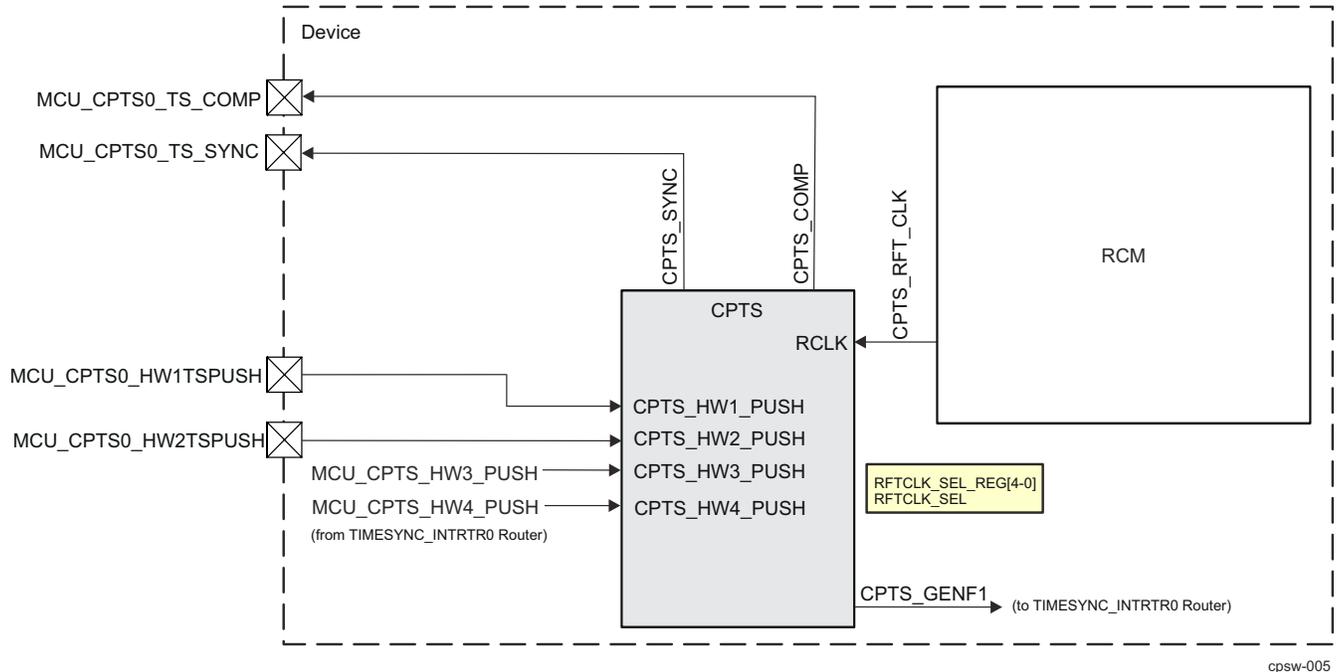

Figure 9-7. CPTS Integration

CPTS IEEE 1588 clock (RCLK) is selected through the CPSW_CPTS_RFTCLK_SEL_REG register.

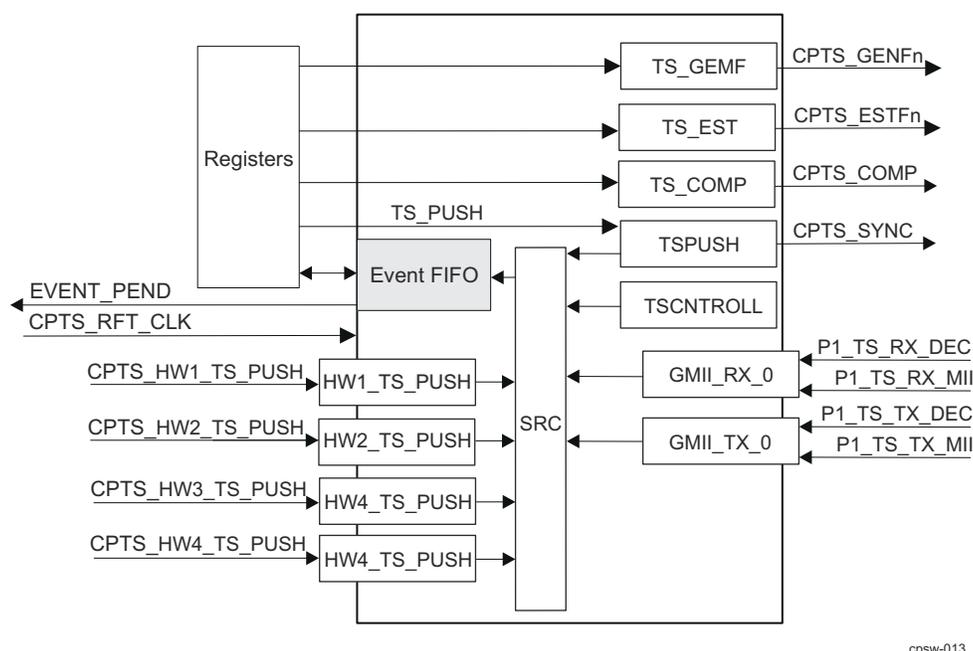

Note

For more information about CPTS clocks and resets, see [Table 9-3](#) in [Section 9.3 CPSW Integration](#).

9.4.27.2 CPTS Architecture

Figure 9-8 shows the architecture of the CPTS module inside the CPSW Ethernet Subsystem. Time stamp values for every packet transmitted or received on either port of the CPSW are recorded. At the same time, each packet is decoded to determine if it is a valid time sync event. If so, an event is loaded into the Event FIFO for processing containing the recorded time stamp value when the packet was transmitted or received.

In addition, both hardware (HWx_TS_PUSH) and software (TS_PUSH) can be used to read the current time stamp value through the Event FIFO. The reference clock used for the time stamp (CPTS_RFT_CLK) can be derived from several sources.

cpsw-013

Figure 9-8. CPTS Block Diagram

Note

See [Section 9.4.27.1](#), *CPTS Integration* for CPTS integration in the device.

9.4.27.3 CPTS Initialization

The CPTS module should be configured as follows:

1. Reset the CPTS module.
2. Write the **rftclk_sel[4:0]** value in the **RFTCLK_Sel** register with the desired reference clock multiplexor value. This value is allowed to be written only when the **cpts_en** bit in CPTS control register is cleared to zero.
3. Write a one to the **cpts_en** bit in the **TS_Control** register. The **RCLK** domain is in reset while this bit is low.
4. Enable the interrupt by writing a one to the **ts_pend** bit in the **Int_Enable** register (if using interrupts and not polling)..

9.4.27.4 32-bit Time Stamp Value

The **time_stamp** value is a 32-bit value that is cleared to zero when **cpts_en** is cleared to zero and increments on each **RCLK** rising edge when **cpts_en** is set to one. The time stamp value can be written via the time stamp load function (**TS_Load_En** and **TS_Load_Low_val** registers). Host software maintains the required number of upper bits of the time stamp value. The upper time stamp value is incremented by the host when the rollover event is detected. The **add_val[2:0]** of **TS_ADD_VAL** value must be zero in 32-bit mode. Nudge and PPM adjustments are not supported in 32-bit mode.

9.4.27.5 64-bit Time Stamp Value

The **time_stamp** value is a 64-bit value that is cleared to zero when **cpts_en** is cleared to zero and increments by the increment value (1 to 8) on each **RCLK** rising edge when **cpts_en** is set to one. The increment value is from 1 to 8 (1 + **ts_add_val[2:0]**). The default increment value is one. The time stamp value can be written via the time stamp load function (**TS_Load_En**, **TS_Load_Low_val**, and **TS_Load_High_val** registers). The **add_val** feature (**TS_ADD_VAL_Reg**) is included to allow 1ns timestamp operations with an **RCLK** rate less than 1Ghz. The below table shows the **RCLK** and **add_val** values for 1ns operations. The highest **RCLK**

frequency possible should be used as allowed by the technology. Table 9-22 shows the RFTCLK_SEL and TS_ADD_VAL_REG values for 1ns operations.

Table 9-22. ADD_VAL feature

RFTCLK_SEL (MHz)	TS_ADD_VAL_REG[2-0]
1 GHz	0
500 MHz	1
333.33 MHz	2
250 MHz	3
200 MHz	4
166.66 MHz	5
142.85714 MHz	6
125 MHz	7

9.4.27.6 64-Bit Timestamp Nudge

The 64-bit **time_stamp** value can be adjusted by writing the **ts_nudge_val[7:0]** register value which is a 2's complement value. A value of 0xff will subtract 1 **RCLK** from the next incremented **time_stamp[63:0]** value. A nudge value of 0x01 will add 1 **RCLK** to the next incremented **time_stamp[63:0]** value. For example, if the current **time_stamp** value is 0x0f06, and **add_val[2:0]=3**, the next incremented timestamp value would be 0x0f0a without a nudge and 0x0f0a +/- **tx_nudge_val[7:0]** with a nudge. The **ts_nudge** value is cleared to zero when the nudge has occurred.

9.4.27.7 64-bit Timestamp PPM

The 64-bit **time_stamp** can be adjusted by parts per million or by parts per hour. Writing a non-zero value to the **ts_ppm[41:0]** (PPM_High & PPM_Low) value enables PPM operations. The adjustment is up or down depending on the **ppm_dir** bit (TS_control_Reg). The **time_stamp** value is increased by the PPM value when **ppm_dir** is cleared and decreased by the PPM value when **ppm_dir** is set.

Parts Per Million example:

To adjust for 100 parts per million the configured value for **ts_ppm[41:0]** is:

$$1,000,000/100 = \text{decimal } 10,000$$

Parts Per Hour example:

To adjust for 1 part per hour at 1 Ghz **RCLK** the configured value for **ts_ppm[41:0]** is: (1,000,000,000hz/1pph) * (3600 seconds/hour) = hex 34630B8A000

9.4.27.8 Event FIFO

The event FIFO contains at least as many locations as two times the number of ports plus 6 locations. Software must service the event FIFO in a timely manner which prevents event FIFO overrun. No overrun indication will be given.

9.4.27.9 Timestamp Compare Output

The **TS_COMP** function is a software oriented feature that is intended to be replaced going forward by the hardware oriented GENF function. **TS_COMP** is not compatible with timestamp PPM or a non-zero **TS_ADD_VAL** value.

9.4.27.9.1 Non-Toggle Mode: 32-bit

The **TS_COMP** output is asserted for **ts_comp_length[31:0]** **RCLK** periods when the **time_stamp[31:0]** (**EVENT_0_REG**) value compares with the **ts_comp_val[31:0]** and the length value is non-zero. The **TS_COMP** rising edge occurs three **RCLK** periods after the values compare. A timestamp compare event is pushed into the event FIFO when **TS_COMP** is asserted. The polarity of the **TS_COMP** output is determined by the **ts_comp_polarity** bit. The output is asserted low when the polarity bit is low.

9.4.27.9.2 Non-Toggle Mode: 64-bit

64-bit mode operation is identical to 32-bit mode except that all 64-bits of the **timestamp[63:0]** are used (Event_0_reg and Event_3_reg) instead of only the lower 32-bits. The 64-bit timestamp cannot be allowed to rollover.

9.4.27.9.3 Toggle Mode: 32-bit

The **TS_COMP** output is asserted for **ts_comp_len[31:0]** RCLK periods when the **time_stamp[31:0]** value compares with the **ts_comp_low_val[31:0]** and the length value is non-zero. The **TS_COMP** toggles thereafter on **ts_comp_low_len[31:0]** RCLK periods. The length high or low can be adjusted by writing the **TS_COMP_NUDGE[7:0]** register value which is a 2's complement value. A value of 0xff will subtract 1 RCLK from the **ts_comp_length[31:0]** value. A value of 0x01 will add 1 RCLK to the **ts_comp_length[31:0]** value. Only a single high or low time is adjusted (nudged) and the **ts_comp_nudge** value is cleared to zero when the nudge has occurred. The **TS_COMP** output is asserted low when the **TS_Comp_Polarity** bit is low. No compare events and no **CPTS_EVNT** interrupts are generated in toggle mode. The **ts_comp_tog** bit must be set for toggle mode, and must be set before writing a non-zero value to **ts_comp_length[31:0]**.

9.4.27.9.4 Toggle Mode: 64-bit

64-bit mode operation is identical to 32-bit mode except that all 64-bits of the **TIMESTAMP** are used (**EVENT_0_REG** and **EVENT_3_REG**). In 32-bit mode only the lower 32-bits (**EVENT_0_REG**) are used.

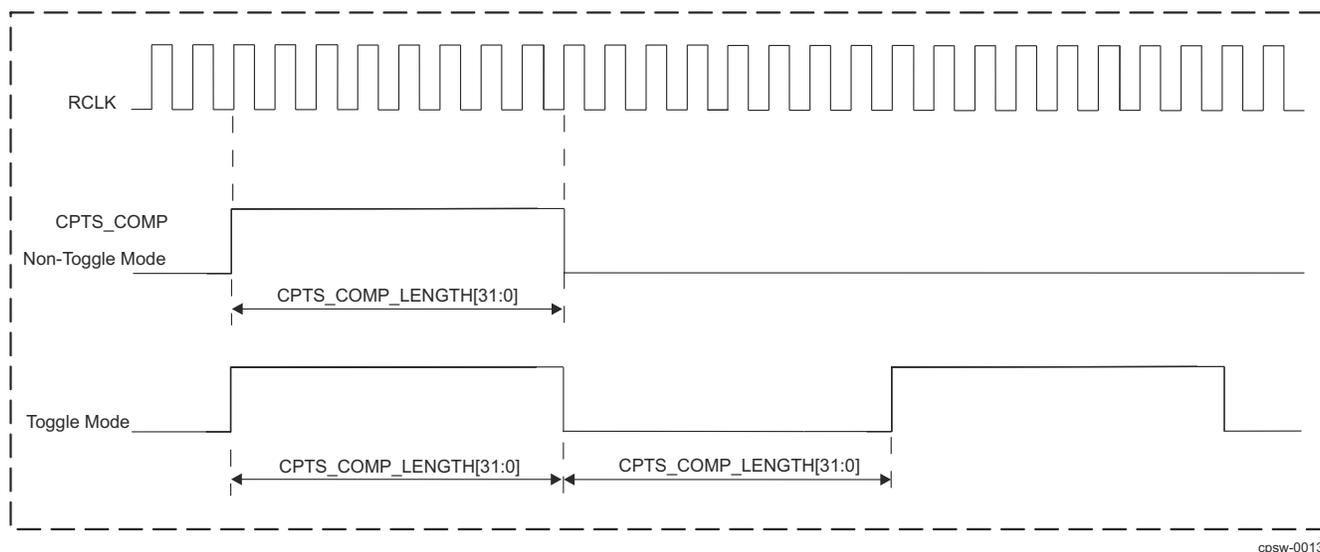

Figure 9-9. CPTS_COMP Output in Toggle and Non-Toggle Mode

9.4.27.10 Timestamp Sync Output

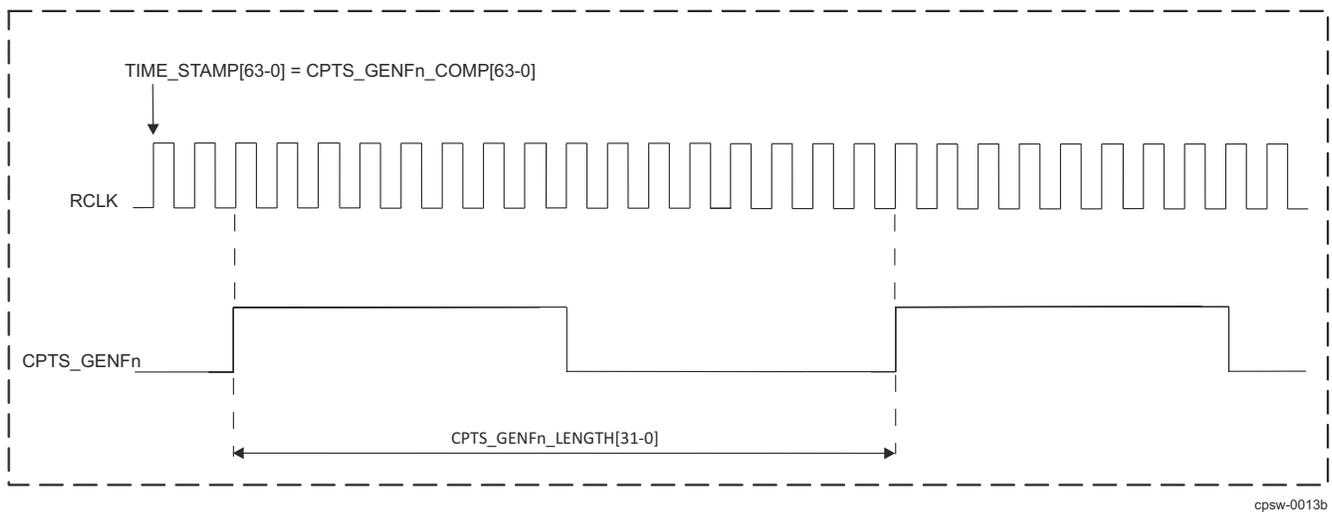

The **CPTS_SYNC** output is a selected bit of the [31:0] **TIME_STAMP** counter value. One of bits 17-31 can be selected in **CPTS_CONTROL_REG[31-28]** **TS_SYNC_SEL**. The **CPTS_SYNC** output is disabled when **CPTS_CONTROL_REG[31-28]** **TS_SYNC_SEL** is zero.

If the selected counter bit is 1 at the time when **TS_SYNC_SEL** value is written then a rising edge will not occur on the **CPTS_SYNC** output. A rising edge will occur on the **CPTS_SYNC** output upon the next transition to 1 of the selected counter bit. The **TS_SYNC_SEL** value must be written to zero before changing to a different non-zero value. No events are generated due to the **CPTS_SYNC** operation. The **CPTS_SYNC** output is two **CPTS_RFT_CLK** periods after the actual count value.

9.4.27.11 Timestamp GENFn Output

The CPTS_GENFn outputs have a programmable cycle (frequency) with a PPM feature and software nudge feature. The CPTS_GENFn output cycle is CPSW_GENF0_LENGTH_REG_I[31-0] CPTS_RFT_CLK periods (which is different than CPTS_COMP operation). [Figure 9-10](#) represents the CPTS_GENFn output signal.

The CPTS_GENFn output cycle is CPSW_GENF0_LENGTH_REG_I[31-0] CPTS_RFT_CLK periods beginning when the 64-bit TIME_STAMP value compares with the 64-bit GENFn_COMP value (CPSW_GENF0_COMP_LOW_REG_I and CPSW_GENF0_COMP_HIGH_REG_I registers) and the length value is non-zero. The CPTS_GENFn output cycle repeats thereafter every CPSW_GENF0_LENGTH_REG_I[31-0] CPTS_RFT_CLK periods. The upper 32-bit word should be written first for 64-bit values. The length should be zero while the comparison value and other configuration parameters are being configured. The length should be written non-zero to enable operations last. The first cycle after comparison is active high when the CPSW_CPTS_CONTROL_REG[2] TS_COMP_POLARITY bit is low. No compare events and no CPTS_EVNT interrupts are generated.

cpsw-0013b

Figure 9-10. CPTS_GENFn Output Signal Diagram

9.4.27.11.1 GENFn Nudge

The cycle length can be adjusted by writing the CPSW_CPTS_TS_COMP_NUDGE_REG[7-0] NUDGE register value which is a two's complement value. A value of FFh will subtract 1 CPTS_RFT_CLK from the CPSW_GENF0_LENGTH_REG_I[31-0] value. A value of 1h will add 1 CPTS_RFT_CLK to the CPSW0_ESTF1_LENGTH_REG_I[23-0] value. The CPSW_CPTS_TS_COMP_NUDGE_REG[7-0] NUDGE value is cleared to zero when the nudge has occurred.

9.4.27.11.2 GENFn PPM

The CPTS_GENFn output cycle can be adjusted by parts per million or by parts per hour. Writing a non-zero value to CPSW_GENF0_PPM_LOW_REG_I/ CPSW_GENF0_PPM_HIGH_REG_I enables PPM operations. The PPM counter continually loads and decrements to zero and then loads again. A single CPTS_RFT_CLK adjustment is made when the PPM counter decrements to zero. The adjustment is up or down depending on the CPSW_ESTF1_CONTROL_REG[0] PPM_DIR bit. When PPM_DIR bit is set a single CPTS_RFT_CLK time is subtracted from the generate function counter which has the effect of increasing the generate function frequency by the PPM amount. When PPM_DIR bit is cleared a single CPTS_RFT_CLK time is added to the generate function counter which has the effect of decreasing the generate function frequency by the PPM amount.

Parts Per Million example:

To adjust for 100 parts per million the configured value for GENF_PPM[41-0] (through CPSW_GENF0_PPM_LOW_REG_I and CPSW_GENF0_PPM_HIGH_REG_I) is:
 $1,000,000/100 = 10,000(\text{decimal})$

Parts Per Hour example:

To adjust for 1 part per hour at 1 GHz CPTS_RFT_CLK the configured value for GENF_PPM[41-0] (through CPSW_GENF0_PPM_LOW_REG_I and CPSW_GENF0_PPM_HIGH_REG_I) is:

$(1,000,0000,000\text{Hz}/1\text{pph}) * (3600 \text{ seconds}/\text{hour}) = 34630\text{B8A}000$ (hex)

9.4.27.12 Timestamp ESTFn

Each Ethernet port has a dedicated ESTFn generator which operates identically to the GENFn function.

9.4.27.13 Time Sync Events

Time Sync events are 96-bit values that are pushed onto the event FIFO and read by software in 32-bit reads. Four 32-bit registers, CPSW_CPTS_EVENT_0_REG through CPSW_CPTS_EVENT_3_REG hold the data of a time sync event. There are eight types of sync events:

- Time Stamp Push Event
- Time Stamp Counter Rollover Event (32-bit mode only)
- Time Stamp Counter Half-rollover Event (32-bit mode only)
- Hardware Time Stamp Push Event
- Ethernet Receive Event
- Ethernet Transmit Event
- Time Stamp Compare Event
- Host Transmit Event

Name	Description
time_stamp	Time Stamp – The timestamp is valid for transmit, receive, and time stamp push event types. The timestamp value is not valid for counter roll event types.

Name	Description
port_number	Port Number – indicates the port number of an Ethernet event (1 to 4 encoded) or the hardware push number (1 to 8 encoded).
event_type	Time Sync Event Type 0000 – Time Stamp Push Event 0001 – Time Stamp Rollover Event (32-bit mode only) 0010 – Time Stamp Half Rollover Event (32-bit mode only) 0011 – Hardware Time Stamp Push Event 0100 – Ethernet Receive Event 0101 – Ethernet Transmit Event 0110 – Time Stamp Compare Event 0111 – Host Event 1000 --- - reserved 1111
message_type	Message type – The message type value that was contained in an Ethernet transmit or receive time sync packet. This field is valid only for Ethernet transmit or receive events.
sequence_id	Sequence ID – The 16-bit sequence id is the value that was contained in an Ethernet transmit or receive time sync packet. This field is valid only for Ethernet transmit or receive events.
domain	Domain – The 8-bit domain is the value that was contained in an Ethernet transmit or receive time sync packet. This field is valid only for Ethernet transmit or receive events.
preempt_queue	Preempt Queue – 0 – The packet was received/transmitted on the express queue. 1 – The packet was received/transmitted on the preempt queue.

9.4.27.13.1 Time Stamp Push Event

Software can obtain the current time stamp value (at the time of the write) by initiating a time stamp push event. The push event is initiated by setting the TS_PUSH bit of the CPSW_CPTS_TS_PUSH_REG register. The time stamp value is returned in the event, along with a time stamp push event code. The upper 32-bits (CPSW_CPTS_EVENT_3_REG register) of the timestamp are zero in 32-bit mode.

9.4.27.13.2 Time Stamp Counter Rollover Event (32-bit mode only)

The CPTS module contains a 32-bit time stamp value (CPSW_CPTS_EVENT_0_REG). The counter upper bits are maintained by host software. The rollover event indicates to software that the time stamp counter has rolled over from 0xFFFF FFFF to 0x0000 0000 and the software-maintained upper count value should be incremented. This event occurs only in 32-bit mode.

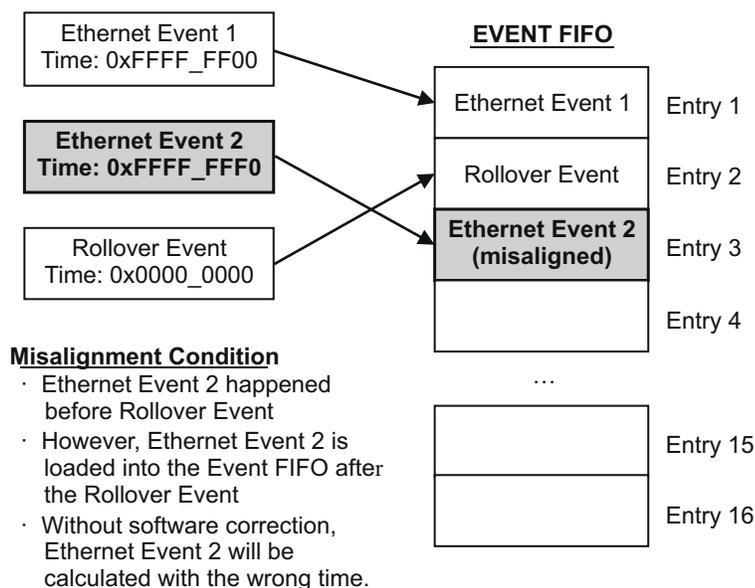

9.4.27.13.3 Time Stamp Counter Half-rollover Event (32-bit mode only)

The CPTS includes a time stamp counter half-rollover event. The half-rollover event indicates to software that the time stamp value (CPSW_CPTS_EVENT_0_REG[31:0] TIME_STAMP) has incremented from 0x7FFF FFFF to 0x8000 0000. The half-rollover event is included to enable software to correct a misaligned event condition. This event occurs only in 32-bit mode.

The half-rollover event is included to enable software to determine the correct time for each event that contains a valid time stamp value, such as an Ethernet event. If an Ethernet event occurs around a counter rollover (full rollover), the rollover event could possibly be loaded into the event FIFO before the Ethernet event, even though the Ethernet event time was actually taken before the rollover. [Figure 9-11](#) shows a misalignment condition. This misaligned event condition arises because an Ethernet event time stamp occurs at the beginning of a packet and time passes before the packet is determined to be a valid synchronization packet. The misaligned event condition occurs if the rollover occurs in the middle, after the packet time stamp has been taken, but before the packet has been determined to be a valid time sync packet.

Host software must detect and correct for misaligned event conditions. For every event time stamp after a rollover and before a half-rollover, software must examine the time stamp most significant bit. If bit 31 of the time stamp value is low (0x0000 0000 through 0x7FFF FFFF), then the event time stamp was taken after the rollover and no correction is required. If the value is high (0x8000 0000 through 0xFFFF FFFF), the time stamp value was taken before the rollover and a misalignment is detected. The misaligned case indicates to software that it must subtract one from the upper count value stored in software to calculate the correct time for the misaligned event. The misaligned event occurs only on the rollover boundary and not on the half-rollover boundary. Software only needs to check for misalignment from a rollover event to a half-rollover event.

When a rollover occurs, software increments the software time stamp upper value. The misaligned case indicates to software that the misaligned event time stamp has a valid upper value that is pre-increment, so one must be subtracted from the upper value to allow software to calculate the correct time for the misaligned event.

cpsw-014

Figure 9-11. Event FIFO Misalignment Condition

9.4.27.13.4 Hardware Time Stamp Push Event

There are four hardware time stamp inputs (CPTS_HW[1:4]_TS_PUSH events) that can cause hardware time stamp push events to be loaded into the Event FIFO. Each time stamp input is mapped in the device as shown in [Figure 9-7](#). The event is loaded into the event FIFO on the rising edge of the timer, and the PORT_NUMBER field in the CPSW_CPTS_EVENT_1_REG register indicates the hardware push input that caused the event (encoded).

The hardware time stamp inputs are asynchronous and are low frequency signals. The CPTS logic synchronizes and performs a rising edge detect on the incoming asynchronous input.

Each hardware time stamp input must be asserted for at least 10 periods of the selected CPTS_RFT_CLK clock. Each input can be enabled or disabled by setting the respective bits in the CPSW_CPTS_CONTROL_REG register.

Hardware time stamps are intended to be an extremely low frequency signals, such that the event FIFO does not overrun. Software must keep up with the event FIFO and ensure that there is no overrun, or events will be lost.

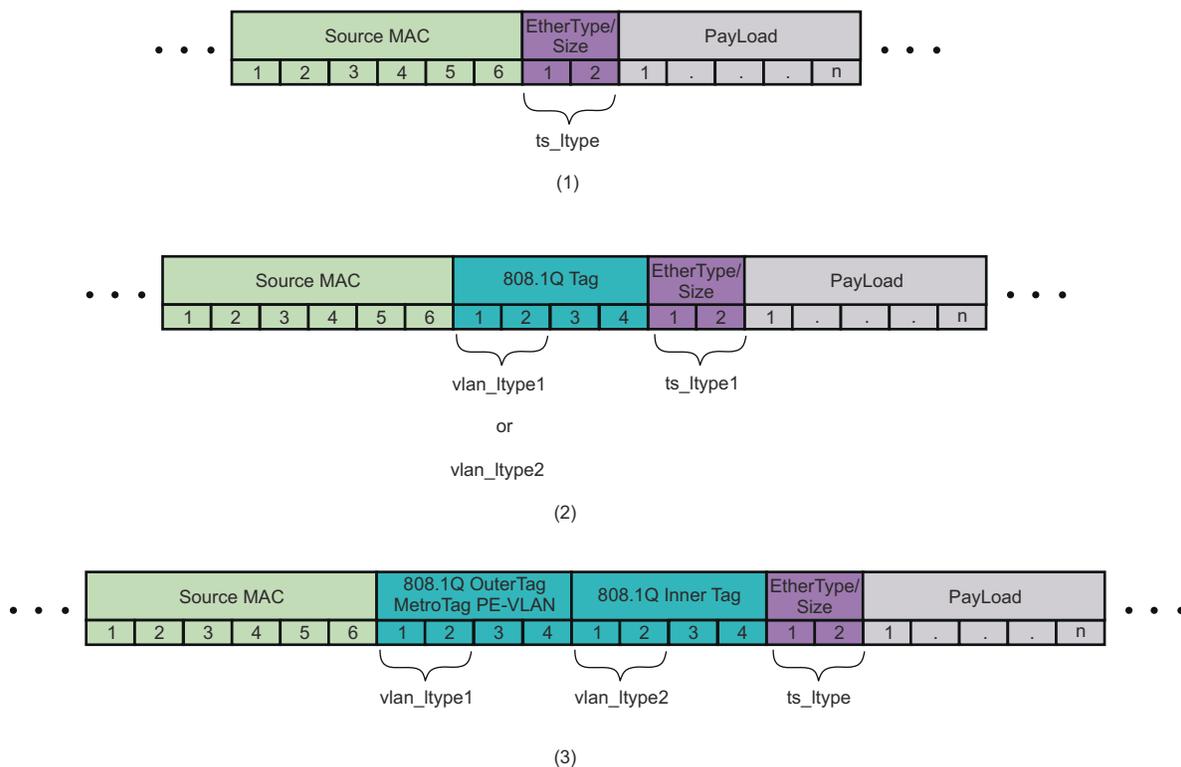

9.4.27.13.5 Ethernet Port Events

Packets transmitted or received on each Ethernet port can generate Ethernet Transmit Events or Ethernet Receive Events, respectively. The CPTS hardware will decode each packet to determine if it is a valid CPTS time sync event.

According to the IEEE 802.3 Ethernet standard, each Ethernet frame contains a 2-octet EtherType field to indicate which protocol is encapsulated in the PayLoad field, as shown in Figure 9-12. For standard time sync packets, this will contain the EtherType for the Precision Time Protocol (IEEE 1588), which is defined as 0x88F7. The CPTS hardware will compare this field to the TS_LTYPE1 field in the CPSW_PN_TS_SEQ_LTYPE_REG register or the TS_LTYPE2 field in CPSW_PN_TS_CTL_LTYPE2_REG register (depending on which enable bit was set) , which should also be programmed to 88F7h.

When a virtual LAN is used, an additional 4-octet 802.1Q tag is inserted in the Ethernet frame before the EtherType field, as shown in Figure 9-12. To indicate to the CPTS hardware that a virtual LAN is in use, the TS_TX_VLAN_LTYPE1_EN (or TS_TX_VLAN_LTYPE2_EN) enable bit must be set in the CPSW_PN_TS_CTL_REG register. The EtherType for the 802.1Q tag is defined as 0x8100, and the CPTS hardware will compare this value to the TS_VLAN_LTYPE1 (or TS_VLAN_LTYPE2 depending on which enable bit was set) field in the CPSW_PN_TS_VLAN_LTYPE_REG register, which should also be programmed to 0x8100.

When two stacked VLANs are used, two additional 4-octet 801.Q tags are inserted in the Ethernet frame before the EtherType field, as shown in Figure 9-12. In this case, both TS_VLAN_LTYPE1 and TS_VLAN_LTYPE2 must be enabled. The outer tag must match the value of the TS_VLAN_LTYPE1 field, and the inner tag must match the value of the TS_VLAN_LTYPE2 field.

9.4.27.13.5.1 Ethernet Port Receive Event

This section describes Ethernet port receive events. Ethernet port generates time synchronization events for valid received time sync packets. For every packet received on the Ethernet port, a timestamp will be captured by the receive module inside the CPTS for the corresponding port. The time stamp will be captured by the receive module regardless of whether or not the packet is a time synchronization packet to make sure that the time stamp is captured as soon as possible. The packet is sampled on both the rising and falling edges of the CPTS_RFT_CLK, and the time stamp will be captured once the start of frame delimiter for the receive packet is detected.

After the time stamp has been captured, the receive interface will begin parsing the packet to determine if it is a valid Ethernet time synchronization packet. The CPSW decoder determines if the packet is a valid Ethernet receive time synchronization event. The receive interface for the port will use the following criteria to determine if the packet is a valid Annex D, Annex E, or Annex F time synchronization Ethernet receive event:

Annex D (IPv4)

1. Receive annex D time sync is enabled (TS_RX_ANNEX_D_EN is set in the CPSW_PN_TS_CTL_REG register).
2. One of the sequences below is true.
 - a. The first packet LTYPE matches 0x0800
 - b. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches 0x0800
 - c. The first packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches 0x0800
 - d. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the third packet LTYPE matches 0x0800
3. Byte 14 (the byte after the LTYPE) contains 0x45 (IPv4).

Note

The byte numbering assumes that there are no VLANs. The byte number is intended to show the relative order of the bytes.

4. Byte 20 contains 0bXXX00000 (5 lower bits zero) and Byte 21 contains 0x00 (fragment offset zero)
5. Byte 22 contains 0x01 (HOP Limit = 1) if the TS_TTL_NONZERO bit in the switch CPSW_PN_TS_CTL_LTYPE2_REG register is cleared to 0h, or byte 22 contains any value if CPSW_PN_TS_CTL_LTYPE2_REG is set to 1h. Byte 22 is the TTL/HOP field.
6. Byte 23 contains 0x11 (Next Header UDP Fixed).
7. The TS_UNI_EN bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is cleared to 0h and Bytes 30 through 33 contain:
 - a. Decimal 224.0.1.129 and the TS_129 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
 - b. Decimal 224.0.1.130 and the TS_130 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
 - c. Decimal 224.0.1.131 and the TS_131 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
 - d. Decimal 224.0.1.132 and the TS_132 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
 - e. Decimal 224.0.0.107 and the TS_107 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set

-OR-

The TS_UNI_EN bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set and Bytes 30 through 33 contain any values.

8. Bytes 36 and 37 contain:

10. The packet was received without error (not long/short/mac_ctl/CRC/code/align).

Annex F (IEEE 802.3)

1. Receive Annex F time sync is enabled (TS_RX_ANNEX_F_EN is set in the switch CPSW_PN_TS_CTL_REG register).
2. One of the sequences below is true:
 - a. The first packet LTYPE matches TS_LTYPE1 in the CPSW_PN_TS_SEQ_LTYPE_REG register. LTYPE 1 should be used when only one time sync LTYPE is to be enabled.
 - b. The first packet LTYPE matches TS_LTYPE2 in the CPSW_PN_TS_CTL_LTYPE2_REG register and LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register.
 - c. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_LTYPE1 in the CPSW_PN_TS_SEQ_LTYPE_REG register
 - d. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_LTYPE2 in the CPSW_PN_TS_CTL_LTYPE2_REG register and TS_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register.
 - e. The first packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_LTYPE1 in the CPSW_PN_TS_SEQ_LTYPE_REG register.
 - f. The first packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_LTYPE2 in the CPSW_PN_TS_CTL_LTYPE2_REG register and TS_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register.
 - g. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the third packet LTYPE matches TS_LTYPE1 in the CPSW_PN_TS_SEQ_LTYPE_REG register.
 - h. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_RX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the third packet LTYPE matches TS_LTYPE2 in the CPSW_PN_TS_CTL_LTYPE2_REG register and TS_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register
3. The PTP message begins in the byte after the LTYPE.
4. The packet message type is enabled in the TS_MSG_TYPE_EN field in the CPSW_PN_TS_CTL_REG register.
5. The packet was received without error (not long/short/mac_ctl/CRC/code/align).

If all of the criteria described above are met for either Annex D, Annex E, or Annex F, and the packet is determined to be a valid time synchronization packet, then the RX interface will push an Ethernet receive event into the event FIFO.

9.4.27.13.5.2 Ethernet Port Transmit Event

This section describes Ethernet port transmit events. For every packet transmitted on the Ethernet ports, the port transmit interface will begin parsing the packet to determine if it is a valid Ethernet time synchronization packet. The CPTS transmit interface for the port will use the following criteria to determine if the packet is a valid time synchronization Ethernet transmit event. The CPSW decoder determines if the packet is a valid ethernet receive time synchronization event. To be a valid Ethernet transmit time synchronization event, the conditions listed below must be true for either Annex D, Annex E, or Annex F:

Annex D (IPv4)

1. Transmit time sync is enabled (TS_TX_ANNEX_D_EN is set in the CPSW_PN_TS_CTL_REG register).
2. One of the sequences below is true.

- a. The first packet LTYPE matches 0x0800
 - b. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches 0x0800
 - c. The first packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches 0x0800
 - d. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the third packet LTYPE matches 0x0800
3. Byte 14 (the byte after the LTYPE) contains 0x45 (IPv4).

Note

The byte numbering assumes that there are no VLANs. The byte number is intended to show the relative order of the bytes.

4. Byte 20 contains 0bXXX00000 (5 lower bits zero) and Byte 21 contains 0x00 (fragment offset zero)
5. Byte 22 contains 0x01 (HOP Limit = 1) if the TS_TTL_NONZERO bit in the switch CPSW_PN_TS_CTL_LTYPE2_REG register is cleared to 0h, or byte 22 contains any value if TS_TTL_NONZERO is set to 1h. Byte 22 is the TTL/HOP field.
6. Byte 23 contains 0x11 (Next Header UDP Fixed).
7. The TS_UNI_EN bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is cleared to 0h and Bytes 30 through 33 contain:
 - a. Decimal 224.0.1.129 and the TS_129 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
 - b. Decimal 224.0.1.130 and the TS_130 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
 - c. Decimal 224.0.1.131 and the TS_131 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
 - d. Decimal 224.0.1.132 and the TS_132 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
 - e. Decimal 224.0.0.107 and the TS_107 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
 - f. The TS_UNI_EN bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set and Bytes 30 through 33 contain any values.
8. Bytes 36 and 37 contain:
 - a. Decimal 0x01 and 0x3F respectively and the TS_319 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set, or
 - b. Decimal 0x01 and 0x40 respectively and the TS_320 bit in the CPSW_PN_TS_CTL_LTYPE2_REG register is set.
9. The PTP message begins in byte 42.
10. The packet message type is enabled in the TS_MSG_TYPE_EN field in the CPSW_PN_TS_CTL_REG register.
11. The packet was sent by host port 0.

Annex E (IPv6)

1. Transmit annex E time sync is enabled (TS_TX_ANNEX_E_EN bit is set in the switch CPSW_PN_TS_CTL_REG register).
2. One of the sequences below is true.
 - a. The first packet LTYPE matches 0x86dd.
 - b. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches 0x86dd
 - c. The first packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches 0x86dd
 - d. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second

- LTYPE matches TS_LTYPE2 in the CPSW_PN_TS_CTL_LTYPE2_REG register and TS_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register.
- g. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the third packet LTYPE matches TS_LTYPE2 in the CPSW_PN_TS_CTL_LTYPE2_REG register.
 - h. The first packet LTYPE matches TS_VLAN_LTYPE1 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE1_EN is set in the CPSW_PN_TS_CTL_REG register and the second packet LTYPE matches TS_VLAN_LTYPE2 in the CPSW_PN_TS_VLAN_LTYPE_REG register and TS_TX_VLAN_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register and the third packet LTYPE matches TS_LTYPE2 in the CPSW_PN_TS_CTL_LTYPE2_REG register and TS_LTYPE2_EN is set in the CPSW_PN_TS_CTL_REG register.
3. The packet message type is enabled in the TS_MSG_TYPE_EN field in the CPSW_PN_TS_CTL_REG register.
 4. The packet was sent by host port 0.

If all of the criteria described above are met, and the packet is determined to be a valid time synchronization packet, then the time stamp for the transmit event will not be generated until the start of frame delimiter of the packet is actually transmitted. The start of frame delimiter will be sampled on every rising and falling edge of the CPTS_RFT_CLK. Once the packet is transmitted, then the TX interface will push an Ethernet transmit event into the event FIFO.

9.4.27.13.5.3

Table 9-23. Values of Message Type Field

Message Type	Value (hex)
Sync	0
Delay_Req	1
Pdelay_Req	2
Pdelay_Resp	3
Reserved	4:7
Follow_Up	8
Delay_Resp	9
Pdelay_Resp_Follow_Up	A
Announce	B
Signaling	C
Management	D
Reserved	E:F

Once a transmitted or received packet is determined to be a valid time sync packet, the Ethernet Transmit Event or Ethernet Receive Event is loaded onto the Event FIFO.

The CPTS_EVENT_1 register contains the Message Type and Sequence ID values from the original time sync packet. The CPTS_EVENT_0 (and CPTS_EVENT_3) register contains the time stamp value when the packet arrived at the corresponding port.

9.4.27.14 Timestamp Compare Event

Note

Timestamp compare events are generated for non-toggle mode only.

The CPTS can generate an event for a time stamp comparison in 32-bit or 64-bit mode.

9.4.27.14.1 32-Bit Mode

The CPTS_COMP output is also asserted when the event is generated. The event is generated when the 32-bit time stamp value (EVENT_0_REG) compares with the CPSW_CPTS_TS_COMP_VAL_REG register and the CPSW_CPTS_TS_COMP_LEN_REG value is non-zero. The CPSW_CPTS_TS_COMP_LEN_REG value should be written by software after the CPSW_CPTS_TS_COMP_VAL_REG register is written and should be zero when the comparison value is written.

9.4.27.14.2 64-Bit Mode

The CPTS_COMP output is also asserted when the event is generated. The event is generated when the 64-bit time stamp value (CPSW_CPTS_EVENT_0_REG and CPSW_CPTS_EVENT_3_REG) compares with the CPWS0_TS_COMP_VAL_REG and CPWS0_TS_COMP_HIGH_VAL_REG registers and the CPWS0_TS_COMP_LEN_REG value is non-zero. The CPWS0_TS_COMP_LEN_REG value should be written by software after the CPWS0_TS_COMP_VAL_REG register is written and should be zero when the comparison value is written.

9.4.27.15 Host Transmit Event

The host can send a packet to be transmitted on an Ethernet port that will generate a time synchronization event. The host sets the TSTAMP_EN bit and sends the DOMAIN, MESSAGE_TYPE, and SEQUENCE_ID in the additional control information that resides in the protocol specific section of the descriptor that is transmitted to the CPSW_2G. An event is then generated and placed on the event FIFO once the packet is transmitted. Host events allow the user to timestamp exactly when a software generated packet exits the device.

9.4.27.16 CPTS Interrupt Handling

The TS_PEND interrupt is enabled by writing a logic high to the **ts_int_enable** bit in the interrupt enable register. The raw interrupt value (before the enable) can be read by reading the **TS_Instat_raw** register. The enabled interrupt value can be read by reading the **TS_Instat_masked** register.

Software can process time sync events via interrupts in the following way:

1. Enable the **TS_PEND** interrupt by writing a logic high to bit zero of the **TS_Int_enable** register.
2. Upon interrupt, read the **Event_0-4** register values.
3. Write logic high to bit-0 of the **Event_Pop** register to pop the previously read value off of the event FIFO.
4. Process the end of interrupt as required by the upper level modules (outside the scope of CPTS).

Software has the option of processing more than a single event from the event FIFO in the interrupt service routine in the following way:

1. Enable the **TS_PEND** interrupt by writing a logic high to bit zero of the **TS_Int_enable** register.
2. Upon interrupt enter the CPTS service routine.
3. Read the **Event_0-4** register values.
4. Write a logic high to bit-0 of the **Event_Pop** register to pop the previously read value off of the event FIFO.
5. Wait for an amount of time greater than four **RCLK** periods plus four **VBUSP_CLK** periods.
6. Read bit 0 (**ts_pend_raw**) in the **TS_Intstat_raw** register to determine if another valid event is in the event FIFO. If bit zero is asserted then go to step 3. If bit 0 is not asserted then go to step 7.
7. Process the end of interrupt as required by the upper level modules (outside the scope of CPTS).

Software also has the option of disabling the interrupt and polling the **ts_intstat_raw** bit to determine if a valid event is on the event FIFO.

9.4.28 MII Management Interface (MDIO)

The MII Management interface module implements the 802.3 serial management interface to interrogate and control external Ethernet PHY using a two-wire bus.

Features Supported

- Clause 22 and CLuse 45 support
- Supports up to 32 PHY addresses.

- Two user access registers to control and monitor up to two PHYs simultaneously.
- VBUS 3.0 compliant slave interface for configuration and control.
- Each PHY can be individually enabled to be polled.
- The inter-poll gap between PHY polls can be changed.
- State Change Mode of operation to monitor up to 32 PHYs simultaneously.
- The MDIO interface can be manually controlled by software for GPIO operations.

9.4.28.1 MDIO Frame Formats

Clause 22

Table 9-24. MDIO Clause 22 Read Frame Format

Pre-amble	Start Delimiter	Operation Code	PHY Address	MMD Number	Turnaround	Data
FFFF FFFFh	01	10	AAAAA	RRRRR	Z0	DDDD.DDDD.DDDD.DDDD

Table 9-25. MDIO Clause 22 Write Frame Format

Pre-amble	Start Delimiter	Operation Code	PHY Address	MMD Number	Turnaround	Data
FFFF FFFFh	01	01	AAAAA	RRRRR	10	DDDD.DDDD.DDDD.DDDD

The default or idle state of the two wire serial interface is a logic one. All tri-state drivers should be disabled and the PHY's pull-up resistor should pull the **MDIO** line to a logic one. Prior to initiating any other transaction, the station management entity shall send a preamble sequence of 32 contiguous logic one bits on the **MDIO** line with 32 corresponding cycles on **MDCLK** to provide the PHY with a pattern that it can use to establish synchronization. A PHY shall observe a sequence of 32 contiguous logic one bits on **MDIO** with 32 corresponding **MDCLK** cycles before it responds to any other transaction.

Preamble

The start of a frame is indicated by a preamble, which consists of a sequence of 32 contiguous bits all of which are a "1". This sequence provides the PHY a pattern to use to establish synchronization.

Start Delimiter

The preamble is followed by the start delimiter which is indicated by a "01" pattern. The pattern assures transitions from the default logic one state to zero and back to one.

Operation Code

The operation code for a read is "10", while the operation code for a write is a "01".

PHY Address

The PHY address is 5 bits allowing 32 unique values. The first bit transmitted is the MSbit of the PHY address.

Register Address

The Register address is 5 bits allowing 32 registers to be addressed within each PHY. Refer to the 10/100 PHY address map for addresses of individual registers.

Turnaround

An idle bit time during which no device actively drives the MDIO signal shall be inserted between the register address field and the data field of a read frame in order to avoid contention. During a read frame, the PHY shall drive a zero bit onto MDIO for the first bit time following the idle bit and preceding the Data field. During a write frame, this field shall consist of a one bit followed by a zero bit.

Data

The Data field is 16-bits. The first bit transmitted and received is the MSbit of the data word.

Clause 45

Table 9-26 shows the address, Table 9-27 shows the read format and Table 9-28 shows the write format of the supported Clause 45 MII Management interface frames. Post-increment accesses are not supported.

Table 9-26. MDIO Clause 45 Address Frame Format

Pre-amble	Start Delimiter	Operation Code	PHY Address	MMD Number	Turnaround	Data
FFFF FFFFh	00	00	AAAAA	RRRRR	10	AAAA.AAAA.AAAA.AAAA

Table 9-27. MDIO Clause 45 Read Frame Format

Pre-amble	Start Delimiter	Operation Code	PHY Address	MMD Number	Turnaround	Data
FFFF FFFFh	00	11	AAAAA	RRRRR	Z0	DDDD.DDDD.DDDD.DDDD

Table 9-28. MDIO Clause 45 Write Frame Format

Pre-amble	Start Delimiter	Operation Code	PHY Address	MMD Number	Turnaround	Data
FFFF FFFFh	00	01	AAAAA	RRRRR	10	DDDD.DDDD.DDDD.DDDD

The default or idle state of the two wire serial interface is a logic one. All tri-state drivers should be disabled and the PHY's pull-up resistor should pull the **MDIO** line to a logic one. Prior to initiating any other transaction, the station management entity shall send a preamble sequence of 32 contiguous logic one bits on the **MDIO** line with 32 corresponding cycles on **MDCLK** to provide the PHY with a pattern that it can use to establish synchronization. A PHY shall observe a sequence of 32 contiguous logic one bits on **MDIO** with 32 corresponding **MDCLK** cycles before it responds to any other transaction. The **MDIO User_Addr** registers must be written before a read or write operation is performed to set the address used in the operation. Each read or write operation has a preceding address frame.

Preamble

The start of a frame is indicated by a preamble, which consists of a sequence of 32 contiguous bits all of which are a "1". This sequence provides the PHY a pattern to use to establish synchronization. The preamble is required in clause 45 operation.

Start Delimiter

The preamble is followed by the start delimiter which is indicated by a "00" pattern.

Operation Code

The operation code for an address transaction is "00", The operation code for a read is "11", while the operation code for a write is a "01".

PHY Address

The PHY address is 5 bits allowing 32 unique values. The first bit transmitted is the MSbit of the PHY address.

MMD Number

The MMD number is the 5-bits allowing 32 unique values. The first bit transmitted is the MSbit.

Turnaround

An idle bit time during which no device actively drives the MDIO signal shall be inserted between the register address field and the data field of a read frame in order to avoid contention. During a read frame, the PHY shall drive a zero bit onto MDIO for the first bit time following the idle bit and preceding the Data field. During a write frame, this field shall consist of a one bit followed by a zero bit.

Address

The address field is 16-bits on address operations. The first bit transmitted is the MSbit of the address word. Each read/write operation initiated has an automatic address operation initiated first that uses the **MDIO User_Addr0/1** register values as the 16-bit address.

Data

The Data field is 16-bits on read and write operations. The first bit transmitted and received is the MSbit of the data word.

9.4.28.2 MDIO Functional Description

The MDIO Management I/F will remain idle until enabled by setting the **enable** bit in the **MDIO Control** register. The module will then continuously poll the linkstatus bits from within the GenericStatusRegister of all enabled 32 PHY addresses. Individual PHY's can be enabled or disabled for polling thru the associated bit in the **Poll_En** register. The **MDIO Link** and **MDIO alive** register bit values are updated on the poll of each PHY. In Normal Mode, The link status of two of the 32 possible PHY addresses can also be determined using the **MLINK** pin inputs. The **linksel** bit in the **MDIO USER_PHY_SEL** register determines the status input that is used. A change in the link status of the two PHYs being monitored will set the appropriate bit in the **MDIO LinkIntRaw** register and the **MDIO LinkIntMasked** register, if enabled by the **linkint_enable** bit in the **MDIO User_Phy_Sel** register. In State Change Mode, a change in any PHY status will be indicated on the **MDIO LINKINT[0]** interrupt if enabled.

The **MDIO Alive** register is updated if the PHY acknowledged the read of the generic status register. In addition, any PHY register read transactions initiated by the host also update the **MDIO Alive** register bit associated with the PHY.

At any time, the host can initiate a transaction for the MDIO module to undertake using the **data**, **phyadr**, **regadd/MMD**, and **write** fields in an **MDIO User_Access** register. When the host sets the **go** bit in this register, the MDIO module will begin the transaction without any further intervention from the host. Upon completion, the MDIO will clear the **go** bit and set the **userintraw** bit in the **MDIO User_Int_Raw** register corresponding to the **MDIO User_Access** register being used. The corresponding bit in the **MDIO User_Int_Masked** register may also be set depending on the mask setting in the **MDIO User_Int_Mask_Set** and **MDIO User_Int_Mask_Clear** registers. A round-robin arbitration scheme is used to schedule transactions which may queued by the host in different **MDIO User_Access** registers. The host should check the status of the **go** bit in the **MDIO User_Access** register before initiating a new transaction to ensure that the previous transaction has completed. The host can use the **ack** bit in the **MDIO User_Access** register to determine the status of a read transaction.

Software may use the MDIO module to setup the auto-negotiation parameters of each PHY attached to a MAC port, retrieve the negotiation results, and setup the **MAC Control** register in the corresponding MAC.

9.4.29 Reset Isolation

The CPSW supports reset isolation of the Ethernet switch ports. When the **ISOLATE** input is asserted the below occur simultaneously:

- The Host Port 0 is removed from ALE processing (packets received on ports 1 through N-1 will be dropped to port 0).
- FHost packets are dropped. Any packet currently in progress when ISOLATE is asserted is dropped due to a FHost packet code error (and possible a CRC or FRAG error).
- THost packets in queue are dropped.

The intent of reset isolation is to allow packets to switch between the Ethernet ports while the remainder of the system is undergoing a reset. Isolation assumes that the external host and logic connected to the port 0 host interface is reset and will not be in the middle of a packet when **ISOLATE** is de-asserted.

9.4.30 CPSW Initialization and Configuration

To configure the CPSW for operation the host must perform the following:

- Ensure that at least 2000 VBUSP_CLK periods are run after reset is de-asserted.
- Configure the CPSW Control register.

- Configure the Ethernet Port Source Address registers
- Configure the Statistics Port Enable registers
- Configure the ALE.
- Configure the Ethernet Ports.

9.4.31 Enet Mac Reset or XGMII/GMII Mode Change Configuration

- Set `pn_cmd_idle` in the Ethernet port `Pn_Mac_Control` registers.
- Wait for `pn_idle` to be indicated in the Ethernet port `Pn_Mac_Status` registers.
- Set `pn_soft_reset` in the Ethernet port `Pn_Soft_Reset` registers.
- Wait for `pn_soft_reset` in the `Pn_Soft_Reset` registers to be cleared to confirm reset completion.
- Configure the Ethernet ports.

9.4.32 Memory Error Detection and Correction

The cpsw error detection and correction logic uses the IP ECC Aggregator Module. The ECC Aggregator allows the control of the cpsw RAMs as shown in the below table. ECC is always enabled. The cpsw FIFO RAMS implement ECC only on packet headers. The packet data is protected by Castignoli CRC (regardless of the input packet CRC type or output CRC type). The ALE and EST RAMs have complete ECC as normal.

9.4.32.1 Packet Header ECC

Only packet headers bits are protected by ECC in the cpsw RAMs. The **ECC_Error_Control1** register **ecc_row** is not implemented – **ecc_bit1** is implemented to determine which bit of the header is flipped for an SEC error when the **ecc_crc_mode** bit is cleared in the **CPSW_Control** register. The ECC status registers return the RAM address that was flipped (**ecc_row**) along with the **ecc_bit1** value. Forcing double bit errors in testing can cause indeterminate switch operation if multiple used packet header bits are flipped given that only single bit errors are fixed by the ECC logic. Header bits 207 down to 200 are not currently used in the switch and may be used to test double bit errors without the possibility of requiring a reset for the switch to recover from the double bit error. No header bits are flipped when **ecc_crc_mode** is set to one. Either the **pn_rx_ecc_err_en** or the **pn_tx_ecc_err_en** bit must be set in the **PN_Control** register to test ecc header errors.

The header ECC code is stored in bits 255 down to 208. If any bit is flipped in the ECC code, the flipped bit will be corrected, but the index of the flipped bit will be reported as bit zero. This implies that when the aggregator reports that there is a SEC on 'bit 0', it can mean two things: either SEC on data bit 0 or SEC somewhere inside the ECC code. Any packet header with ECC error issues a pulse on **ECC_PULSE_INTR** as does an ale ram ECC error.

9.4.32.2 Packet Protect CRC

Each ingress packet without error is passed through the cpsw with an internally generated Castignoli protect CRC. The protect CRC is checked on port egress for correctness and is replaced. If the CRC is correct (no RAM bit errors), then the packet is output with the selected port CRC type. If a protect CRC error is detected on THost then the **memory_protect_error** buffer descriptor bit will be asserted so that the packet is dropped to the host. If a protect CRC error is detected on Ethernet egress then the egress CRC will be generated on the packet and at least one byte of the CRC will be inverted on output. CRC memory protect errors do not assert the **ECC_PULSE_INTR** signal. CRC memory protect errors are counted in the associated port statistics registers and issue an interrupt on **STAT_PEND_INTR** if any CRC memory protect error occurs (and the statistics for that port are enabled). When the **ecc_crc_mode** bit in the **CPSW_Control** register is set, the **ecc_bit1** aggregator register will flip the associated column bit in any FIFO memory read operation, inducing a CRC protect error when the protect CRC is checked. No header bits are flipped when **ecc_crc_mode** is set. Either the **pn_rx_ecc_err_en** or the **pn_tx_ecc_err_en** bit must be set in the **PN_Control** register to test packet CRC errors.

RAM 0	ALE Ram
RAM 1	Port 0 FIFO Rx Ram
RAM 2	Port 0 FIFO Tx Ram
RAM 3	Port 1 FIFO Rx Ram

RAM 4	Port 1 FIFO Tx Ram
RAM 5	Port 2 FIFO Rx Ram
RAM 6	Port 2 FIFO Tx Ram
...	...
RAM (N*2) - 1	Port N FIFO Rx Ram
RAM (N*2)	Port N FIFO Tx Ram
RAM 19	EST Ram

9.4.32.3 Aggregator Ram Control

The ECC logic for each FIFO ram (receive and transmit) is divided into eight separate ECC encoders/decoders that encode/decode 26-bits of data each. Each of the 8 encoders (0 to 7) generates 6-bits of ECC code (48 code bits total), and each of the eight decoders (0 to 7) checks 6-bits of ECC code across the 26-bits of data (208 data bits total). The 48-bits of ECC code are passed through the ram in the upper 48 unused bits in the header word. The header data bits and ECC code bits are shown in the below table. The **ecc_bit1[15:0]** value returned on error is a 16-bit value that is the concatenation of 5-bits of zero, 3-bits of the encoder/decoder number (0 to 7), 3-bits of zero, and 5-bits of index into the indicated 26-bit encoder/decoder. For example, an **ecc_bit1** value of 0x0308 is bit-8 of encoder/decoder 3, which is header bit 86 ($((26*3) + 8)$).

Header Data Bits	Encoder/Decoder
25:0	Encoder/Decoder 0 Data
51:26	Encoder/Decoder 1 Data
77:52	Encoder/Decoder 2 Data
103:78	Encoder/Decoder 3 Data
129:104	Encoder/Decoder 4 Data
155:130	Encoder/Decoder 5 Data
181:156	Encoder/Decoder 6 Data
207:182	Encoder/Decoder 7 Data
213:208	Encoder/Decoder 0 Code
219:214	Encoder/Decoder 1 Code
225:220	Encoder/Decoder 2 Code
231:226	Encoder/Decoder 3 Code
237:232	Encoder/Decoder 4 Code
243:238	Encoder/Decoder 5 Code
249:244	Encoder/Decoder 6 Code
255:250	Encoder/Decoder 7 Code

9.4.33 CPSW Network Statistics

The CPSW has statistics that record events associated with frame traffic on each port. STAT0 keeps statistics for PORT0, STAT1 for PORT1 and so on. All statistics are 32-bit registers. By convention the statistics registers are receive for ingress and transmit for egress for all ports.

If any bit in **stat_port_en** is set for a specific STAT module, the value written to a statistics register will be subtracted from the register value with the result being stored in the register. If a value greater than the statistics value is written, then zero will be written to the register (writing 0xffffffff will clear a statistics location). When all port enable bits are cleared to zero, all statistics registers are read/write (normal write direct, so writing 0x00000000 will clear a statistics location). All write accesses must be 32-bit accesses. In the below statistics descriptions, "the port" refers to any enabled port (with a corresponding set **stat_port_en** bit).

9.4.33.1 Rx (only) Statistics Descriptions

9.4.33.1.1 Good Rx Frames

The total number of good frames received on the port. A good frame is defined to be:

- any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error.

See the **Rx Align/Code Errors** and **Rx CRC errors** statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

9.4.33.1.2 Broadcast Rx Frames

The total number of good broadcast frames received on the port. A good broadcast frame is defined to be:

- any data or MAC control frame which was destined for address 0xFFFFFFFF only, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error.

See the **Rx Align/Code Errors** and **Rx CRC errors** statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

9.4.33.1.3 Multicast Rx Frames

The total number of good multicast frames received on the port. A good multicast frame is defined to be:

- any data or MAC control frame which was destined for any multicast address other than 0xFFFFFFFF, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error.

See the **Rx Align/Code Errors** and **Rx CRC errors** statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

9.4.33.1.4 Pause Rx Frames

The total number of IEEE 802.3X pause frames received by the port (whether acted upon or not). Such a frame:

- contained any unicast, broadcast, or multicast address, and
- contained the length/type field value 88.08 (hex) and the opcode 0x0001, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error, and
- pause frames are enabled on the port (pn_tx_flow_en = 1).

The port could have been in either half or full-duplex mode.

See the **Rx Align/Code Errors** and **Rx CRC errors** statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic

or

The total number of priority based flow control (802.1Qbb) pause frames received by the port (whether acted upon or not). Such a frame:

- contained any unicast, broadcast, or multicast address, and
- contained the length/type field value 88.08 (hex) and the opcode 0x0001, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, and
- priority based flow control pause frames are enabled on the port.

See the **Rx CRC errors** statistic descriptions for definitions of CRC errors. Overruns have no effect upon this statistic

9.4.33.1.5 Rx CRC Errors

The total number of frames received on the port that experienced a CRC error. Such a frame:

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no code/align error, and
- had a CRC error.

Overruns have no effect upon this statistic.

A CRC error is defined to be:

- a frame containing an even number of nibbles, and
- fails the Frame Check Sequence test.

9.4.33.1.6 Rx Align/Code Errors

The total number of frames received (ingress) on the port that experienced an alignment error or code error. Such a frame:

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had either an alignment error or a code error.

Over-runs have no effect upon this statistic.

An alignment error is defined to be:

- a frame containing an odd number of nibbles, and
- also fails the Frame Check Sequence test if the final nibble is ignored.

A code error is defined to be:

- A frame which has been discarded because the port's **MRXER** pin driven with a one for at least one bit-time's duration at any point during the frame's reception.

Note

RFC 1757 etherStatsCRCAAlignErrors Ref. 1.5 can be calculated by summing **Rx Align/Code Errors** and **Rx CRC errors** (see below).

10G: For XGMII, packets are ended at the code error and only that number of bytes are kept when rx_cef is set (includes the code error bytes).

9.4.33.1.7 Oversize Rx Frames

The total number of oversized frames received on the port. An oversized frame is defined to be:

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was greater than pn_rx_maxlen in bytes, and
- had no CRC error, alignment error or code error.

See the **Rx Align/Code Errors** and **Rx CRC errors** statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

9.4.33.1.8 Rx Jabbers

The total number of jabber frames received on the port. A jabber frame is:

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was greater than pn_rx_maxlen bytes long, and
- had a CRC error, an alignment error, or a code error.

See the **Rx Align/Code Errors** and **Rx CRC errors** statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

9.4.33.1.9 Undersize (Short) Rx Frames

The total number of undersized frames received on the port. An undersized frame is defined to be:

- any data frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was less than 64 bytes long, and
- had no CRC error, alignment error or code error.

See the **Rx Align/Code Errors** and **Rx CRC errors** statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

9.4.33.1.10 Rx Fragments

The total number of frame fragments received on the port. A frame fragment is defined to be:

- any data frame (address matching does not matter), and
- was less than 64 bytes long, and
- had a CRC error, an alignment error, or a code error, and
- was not the result of a collision caused by half duplex, collision based flow control.

See the **Rx Align/Code Errors** and **Rx CRC errors** statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

9.4.33.1.11 Rx IPG Error

The total number of 10G frames received on a port that had a correct preamble but did not have at least five bytes of IDLE preceding the frame. This does not indicate if the frame with the IPG error was kept or ignored.

9.4.33.1.12 Rx Bottom Of FIFO Drop

Ethernet Ports

The total number of ingress frames on a port that overran the port's receive FIFO and were dropped (bottom of receive FIFO). Port 0 (CPPI transmit port) should not drop packets on ingress because port 0 ingress flow control should be enabled. The Ethernet ports will only drop packets in the receive FIFO when receive flow control is enabled and the sending port ignores sent pause frame and then overruns the receive FIFO. The overrun frame is defined to be:

- any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was any length (including <64 bytes and > pn_rx_maxlen bytes), and
- Was dropped on port 0 due to a lack of memory space in the receive FIFO

Note

This stat should be zero

Host Port 0

This statistic also counts frames dropped on port 0 that were 17 to 33 bytes (only for port 0). For Ethernet ports, the drop count for frames shorter than 33 bytes is included in the undersized or fragment count. Port 0 simply gives an indication that a packet with 33 bytes was dropped. No other statistics are counted for frames shorter than 33 bytes.

9.4.33.1.13 Portmask Drop

All Ports

The total number of ingress frames on a port that were dropped by the ALE (the ALE did not forward the packet to any port). The frame was defined to be:

- any data or MAC control frame
- Was any length greater than 32 bytes
- Was dropped by the ALE - ale_portmask = 0 (was not sent to any destination port)

- The frame could have been dropped due to error or other counted reason, so it could be counted elsewhere also.

Note

This stat does not count in the overall total as it includes every packet received greater than 32 bytes that had a zero **port_mask**.

9.4.33.1.14 Rx Top Of FIFO Drop

All Ports

The total number of frames received on a port that had a **START** of frame (SOF) overrun on any destination port egress (when attempting to load the packet from the top of the ingress port receive FIFO into any other port's transmit FIFO). If a multicast/broadcast packet is dropped by multiple destination ports then this statistic will increment by the number of ports that dropped the packet. Rx Top Of FIFO Drop is defined to be:

- any data or MAC control frame
- Was any length greater than 32 bytes
- Was dropped by the ALE - ale_portmask = 0 (was not sent to any destination port)
- The frame could have been dropped due to error or other counted reason, so it could be counted elsewhere also.

9.4.33.1.15 ALE Drop

All Ports

The total number of frames received on a port such that the destination address was not equal to the source address and the packet was not destined to the port it was received on, but the frame was not forwarded to any port (the **port_mask** was zero).

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was any length (including <64 bytes and > pn_rx_maxlen bytes), and
- had no CRC error, alignment error or code error, and
- the destination address was not equal to the source address, and
- The packet was not destined for the port it was receive on, and
- had a zero port_mask

9.4.33.1.16 ALE Overrun Drop

All Ports

The total number of frames received on a port that were dropped (zero **port_mask**) due to exceeding the maximum ALE lookup rate (Port 0 should not have ALE Overrun Drops because the ingress rate is controlled to prevent it). This statistic should be zero and when non-zero indicates a system clock issue or indicates that short packets were sent with **pn_rx_csf_en** at a rate that exceeded the maximum lookup rate.

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was any length (including <64 bytes and > pn_rx_maxlen bytes), and
- the maximum ALE lookup rate was exceeded so the lookup was aborted and the packet was dropped.

9.4.33.1.17 ALE Rate Limit Drop

All Ports

The total number of frames received on a port that were dropped (zero **port_mask**) due to receive rate limiting on this port or due to transmit rate limiting on any destination port (not sent to all expected destination ports if transmit rate limiting).

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and

- was any length (including <64 bytes and > pn_rx_maxlen bytes), and
- had no CRC error, alignment error or code error, and
- the receive rate was exceeded and the packet was dropped, or the transmit rate was exceeded to any destination port and the packet was dropped to one or more expected destination ports (indicates that the destinations were pruned due to rate limiting).

9.4.33.1.18 ALE VLAN Ingress Check Drop

The total number of frames received on a port that were dropped (zero **port_mask**) due to VLAN ingress check failure.

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was any length (including <64 bytes and > pn_rx_maxlen bytes), and
- had no CRC error, alignment error or code error, and
- the VLAN ID ingress check failed (the receive port was not in the group), and
- The address lookup did not return a match with the super bit set

9.4.33.1.19 ALE DA=SA Drop

The total number of frames received on a port that were dropped (zero **port_mask**) due to destination address equal to source address.

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was any length (including <64 bytes and > pn_rx_maxlen bytes), and
- had no CRC error, alignment error or code error, and
- The destination address was equal to the source address
- The source address was not an entry in the table.

9.4.33.1.20 Block Address Drop

The total number of frames received on a port that were dropped (zero **port_mask**) due to the destination or source address being blocked.

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was any length (including <64 bytes and > pn_rx_maxlen bytes), and
- had no CRC error, alignment error or code error, and
- the source or destination address matched a table entry with the block bit set.

9.4.33.1.21 ALE Secure Drop

The total number of frames received on a port that were dropped (zero **port_mask**) due to a secure violation (the source address is owned by a different receive port).

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was any length (including <64 bytes and > pn_rx_maxlen bytes), and
- had no CRC error, alignment error or code error, and
- the source address is an entry in the table with the secure bit set and a port number for a different receive port.

9.4.33.1.22 ALE Authentication Drop

The total number of frames received on a port that were dropped (zero **port_mask**) due to authentication failure.

- was any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was any length (including <64 bytes and > pn_rx_maxlen bytes), and
- had no CRC error, alignment error or code error, and
- enable_auth_mode is set, and
- the source address is not equal to the destination address, and

- the source address is not a table entry, and
- the destination address is not a table entry with the super bit set.

9.4.33.1.23 ALE Unknown Unicast

The total number of frames received on a port that had a unicast destination address with an unknown source address. The frame is defined to be:

- was any data frame with a unicast destination address, and
- the source address was not a table entry, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error.

Note

The ALE Unknown Unicast Bytecount statistic is the number of bytes contained in the ALE Unknown Unicast frames.

9.4.33.1.24 ALE Unknown Multicast

The total number of frames received on a port that had a multicast destination address with an unknown source address. The frame is defined to be:

- was any data frame with a multicast destination address, and
- the source address was not a table entry, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error.

Note

The ALE Unknown Multicast Bytecount statistic is the number of bytes contained in the ALE Unknown Multicast frames.

9.4.33.1.25 ALE Unknown Broadcast

The total number of frames received on a port that had a Broadcast destination address with an unknown source address. The frame is defined to be:

- was any data frame with a broadcast destination address, and
- the source address was not a table entry, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error.

Note

The ALE Unknown Broadcast Bytecount statistic is the number of bytes contained in the ALE Unknown Broadcast frames.

9.4.33.1.26 ALE Policer Match

The total number of frames received on a port that had a matched a policer. The frame is defined to be:

- any data frame, and
- matched a condition on a policer, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error.

9.4.33.1.27 ALE Policer Match Red

The total number of frames received on a port that had matched a policer and the condition was red. The frame is defined to be:

- any data frame, and
- matched a policer with the condition red, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and

- had no CRC error, alignment error or code error.

9.4.33.1.28 ALE Policer Match Yellow

The total number of frames received on a port that had matched a policer and the condition was yellow. The frame is defined to be:

- any data frame, and
- matched a policer with the condition yellow, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error.

9.4.33.1.29 IET Receive Assembly OK

The total number of correctly received and re-assembled preemptable frames.

- any preemptable frame received
- was any size, and
- was correctly received and re-assembled without error.

9.4.33.1.30 IET Receive Assembly Error

The total number of preemptable received frames with IET assembly errors.

- any frame received
- was any size, and
- was a non-initial fragment that mismatched the frame count or fragment count (went to the assembly error state in the IET receive state machine).

9.4.33.1.31 IET Receive SMD Error

The total number of received frames rejected due to an unknown SMD value or received frames rejected with an SMD-C when no frame is in progress.

- any frame received
- was any size, and
- was rejected because of an unknown SMD value or SMD-C with no frame in progress.

Note

If **iet_en** is not set, this statistic counts any received frame with any non express SMD.

9.4.33.1.32 IET Receive Merge Fragment Count

The total number of received non-initial fragments that did not have an assembly error. The IET stat aMACMergeFragCountRx is derived by adding the Receive Assembly Error count to this value.

- any frame received
- was any size, and
- was a non-initial fragment that did not contain an assembly error.

9.4.33.1.33 Rx Octets

The total number of bytes in all good frames received on the port. A good frame is defined to be:

- any data or MAC control frame which matched a unicast, broadcast or multicast address, or matched due to promiscuous mode, and
- was of length 64 to pn_rx_maxlen bytes inclusive, and
- had no CRC error, alignment error or code error.

See the **Rx Align/Code Errors** and **Rx CRC errors** statistic descriptions for definitions of alignment, code and CRC errors. Overruns have no effect upon this statistic.

9.4.33.2 Tx (only) Statistics Descriptions

The maximum and minimum transmit frame size is software controllable.

Those overruns (**P0_Tx_SOF_OVERRUN** and **P0_Tx_MOF_OVERRUN**) have no effect on Tx statistics. They are counted separately.

9.4.33.2.1 Good Tx Frames

The total number of good frames transmitted on the port. A good frame is defined to be:

- any data or MAC control frame which was destined for any unicast, broadcast or multicast address, and
- was any length, and
- had no late or excessive collisions, no carrier loss and no underrun.

9.4.33.2.2 Broadcast Tx Frames

The total number of good broadcast frames transmitted on the port. A good broadcast frame is defined to be:

- any data or MAC control frame destined for address 0xFFFFFFFF only, and
- was of any length, and
- had no late or excessive collisions, no carrier loss and no underrun

9.4.33.2.3 Multicast Tx Frames

The total number of good multicast frames transmitted on the port. A good multicast frame is defined to be:

- any data or MAC control frame destined for any multicast address other than 0xFFFFFFFF, and
- was of any length, and
- had no late or excessive collisions, no carrier loss and no underrun.

9.4.33.2.4 Pause Tx Frames

This statistic indicates the number of IEEE 802.3X pause frames transmitted by the port.

Pause frames cannot contain a CRC error because they are created in the transmitting MAC, so these error conditions have no effect upon the statistic. Pause frames sent by software will not be included in this count.

Since pause frames are only transmitted in full duplex carrier loss and collisions have no effect upon this statistic.

Transmitted pause frames are always 64 byte multicast frames so will appear in the **Tx Multicast Frames** and **64octet Frames** statistics.

9.4.33.2.5 Collisions

This statistic records the total number of times that the port experienced a collision. Collisions occur under two circumstances.

1. When a transmit data or MAC control frame:
 - was destined for any unicast, broadcast or multicast address, and
 - was any size, and
 - had no carrier loss and no underrun, and
 - experienced a collision. A jam sequence is sent for every non-late collision, so this statistic will increment on each occasion if a frame experiences multiple collisions (and increments on late collisions).

CRC errors have no effect upon this statistic.

2. When the port is in half-duplex mode, flow control is active, and a frame reception begins.

9.4.33.2.6 Single Collision Tx Frames

The total number of frames transmitted on the port that experienced exactly one collision. Such a frame:

- was any data or MAC control frame destined for any unicast, broadcast or multicast address, and
- was any size, and
- had no carrier loss and no underrun, and
- experienced one collision before successful transmission. The collision was not late.

CRC errors have no effect upon this statistic.

9.4.33.2.7 Multiple Collision Tx Frames

The total number of frames transmitted on the port that experienced multiple collisions. Such a frame:

- was any data or MAC control frame destined for any unicast, broadcast or multicast address, and
- was any size, and
- had no carrier loss and no underrun, and
- experienced 2 to 15 collisions before being successfully transmitted. None of the collisions were late.

CRC errors have no effect upon this statistic.

9.4.33.2.8 Excessive Collisions

The total number of frames for which transmission was abandoned due to excessive collisions. Such a frame:

- was any data or MAC control frame destined for any unicast, broadcast or multicast address, and
- was any size, and
- had no carrier loss and no underrun, and
- experienced 16 collisions before abandoning all attempts at transmitting the frame. None of the collisions were late.

CRC errors have no effect upon this statistic.

9.4.33.2.9 Late Collisions

The total number of frames on the port for which transmission was abandoned because they experienced a late collision. Such a frame:

- was any data or MAC control frame destined for any unicast, broadcast or multicast address, and
- was any size, and
- experienced a collision later than 512 bit-times into the transmission. There may have been up to 15 previous (non-late) collisions which had previously required the transmission to be re-attempted. The Late Collisions statistic dominates over the single, multiple and excessive Collisions statistics - if a late collision occurs the frame will not be counted in any of these other three statistics.

CRC errors, carrier loss, and underrun have no effect upon this statistic.

9.4.33.2.10 Deferred Tx Frames

The total number of frames transmitted on the port that first experienced deferment. Such a frame:

- was any data or MAC control frame destined for any unicast, broadcast or multicast address, and
- was any size, and
- had no carrier loss and no underrun, and
- experienced no collisions before being successfully transmitted, and
- found the medium busy when transmission was first attempted, so had to wait.

CRC errors have no effect upon this statistic

See RFC1623 Ref. 2.6 dot3StatsDeferredTransmissions.

9.4.33.2.11 Carrier Sense Errors

The total number of frames on the port that experienced carrier loss. Such a frame:

- was any data or MAC control frame destined for any unicast, broadcast or multicast address, and
- was any size, and
- the carrier sense condition was lost or never asserted when transmitting the frame (the frame is not retransmitted). This is a transmit only statistic. Carrier Sense is a don't care for received frames. Transmit frames with carrier sense errors are sent until completion and are not aborted.
- CRC errors and underrun have no effect upon this statistic.

9.4.33.2.12 Tx Octets

The total number of bytes in all good frames transmitted on the port. A good frame is defined to be:

- any data or MAC control frame which was destined for any unicast, broadcast or multicast address, and

- was any size, and
- had no late or excessive collisions and no carrier loss.

9.4.33.2.13 Transmit Priority 0-7

The total number of frames transmitted on the port from transmit FIFO priority 0-7. Collision retries do not affect this statistic. Pause frames do not affect this statistic.

- any frame transmitted from priority 0-7, and
- was less than or equal to `cpsw_tx_pri(0-7)_maxlen`.
- Collision retries are not counted in this statistic
- Pause frames are not counted in this statistic.
- Carrier sense errors do not affect this statistic.

Note

The Transmit Priority 0-7 Bytecount statistic is the number of bytes contained in the frames of the Transmit Priority 0-7 statistic.

9.4.33.2.14 Transmit Priority 0-7 Drop

The total number of transmit frames on the port that overran the transmit FIFO priority 0-7 and were dropped. This count includes frames dropped due to `cpsw_tx_pri(0-7)_maxlen`.

- any frame destined to be transmitted from priority 0-7, and
- was any size, and
- was dropped due to priority 0-7 FIFO overrun (Start of packet overrun).
- Was dropped due to frame size larger than `cpsw_tx_pri(0-7)_maxlen`.

Note

The Transmit Priority 0-7 Drop Bytecount statistic is the number of bytes contained in the frames of the Transmit Priority 0-7 Drop statistic.

9.4.33.2.15 Transmit Memory Protect Errors

The total number of transmit frames on the port that had a memory protect CRC error on egress.

- any frame destined to be transmitted, and
- was any size, and
- Had a memory protect CRC error on egress.

Frames to the host with memory protect errors are indicated to be dropped with a set receive buffer descriptor **drop** bit. Ethernet frames will have at least one byte of the generated port type CRC inverted on egress.

This statistic is 8-bits wide only and will not rollover but will limit at 0xff.

A non-zero value in this statistic will issue a **STAT_PEND_INTR** interrupt for the associated port.

9.4.33.2.16 IET Transmit Merge Fragment Count

The total number of non-initial preemptable transmit fragments on preemptable transmit.

- any frame destined to be transmitted on the preemptable port, and
- was any size, and
- was a non-initial fragment.

9.4.33.2.17 IET Transmit Merge Hold Count

The total number of preemptable frames that were preempted and reassembled by the assertion of `pn_mac_hold` in the **Enet_Pn_IET_Control** register or were preempted by EST. The IET statistic `aMACMergeHoldCount` can be derived and maintained by software.

- any frame destined to be transmitted on the preemptable port, and
- was any size, and
- was preempted by the assertion of pn_mac_hold, or
- was preempted by Enhanced Scheduled Traffic (EST).

9.4.33.3 Rx and Tx (shared) Statistics Descriptions

9.4.33.3.1 Net Octets

The total number of bytes of frame data received and transmitted on the port. Each frame counted:

- was any data or MAC control frame destined for any unicast, broadcast or multicast address (address match does not matter), and
- was of any size (including <64 byte and > pn_rx_maxlen byte frames).

Also counted in this statistic are:

- every byte transmitted before a carrier-loss was experienced,
- every byte transmitted before each collision was experienced, (i.e. multiple retries are counted each time),
- every byte received if the port is in half-duplex mode until a jam sequence was transmitted to initiate flow control. (The jam sequence was not counted to prevent double-counting).

Error conditions such as alignment errors, CRC errors, code errors, overruns and underruns do not affect the recording of bytes by this statistic.

The objective of this statistic is to give a reasonable indication of Ethernet utilization.

9.4.33.3.2 Rx + Tx 64 Octet Frames

The total number of 64-byte frames received and transmitted on the port. Such a frame is defined to be:

- any data or MAC control frame which was destined for any unicast, broadcast or multicast address, and
- did not experience late collisions, excessive collisions, or carrier sense error, and
- was exactly 64 bytes long. (If the frame was being transmitted and experienced carrier loss that resulted in a frame of this size being transmitted, then the frame will be recorded in this statistic).

CRC errors, code/align errors and overruns do not affect the recording of frames in this statistic.

9.4.33.3.3 Rx + Tx 65-127 Octet Frames

The total number of frames of size 65 to 127 bytes received and transmitted on the port. Such a frame is defined to be:

- any data or MAC control frame which was destined for any unicast, broadcast or multicast address, and
- did not experience late collisions, excessive collisions, or carrier sense error, and
- was 65 to 127 bytes long.

CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic.

9.4.33.3.4 Rx + Tx 128-255 Octet Frames

The total number of frames of size 128 to 255 bytes received and transmitted on the port. Such a frame is defined to be:

- any data or MAC control frame which was destined for any unicast, broadcast or multicast address, and
- did not experience late collisions, excessive collisions, or carrier sense error, and
- was 128 to 255 bytes long.

CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic.

For Rx reference only, see RFC1757 Ref. 1.13 etherStatsPkts128to255Octets.

9.4.33.3.5 Rx + Tx 256-511 Octet Frames

The total number of frames of size 256 to 511 bytes received and transmitted on the port. Such a frame is defined to be:

- any data or MAC control frame which was destined for any unicast, broadcast or multicast address, and
- did not experience late collisions, excessive collisions, or carrier sense error, and
- was 256 to 511 bytes long.

CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic. Rx + Tx 512-1023 Octet Frames

The total number of frames of size 512 to 1023 bytes received and transmitted on the port. Such a frame is defined to be:

- any data or MAC control frame which was destined for any unicast, broadcast or multicast address, and
- did not experience late collisions, excessive collisions, or carrier sense error, and
- was 512 to 1023 bytes long.

CRC errors, code/align errors and overruns do not affect the recording of frames in this statistic.

9.4.33.3.6 Rx + Tx 1024_Up Octet Frames

The total number of frames of size 1024 to **pn_rx_maxlen** bytes for receive or 1024 up for transmit on the port. Such a frame is defined to be:

- any data or MAC control frame which was destined for any unicast, broadcast or multicast address, and
- did not experience late collisions, excessive collisions, or carrier sense error, and
- was 1024 to pn_rx_maxlen bytes long on receive, or any size on transmit.

CRC errors, code/align errors, underruns and overruns do not affect the recording of frames in this statistic.

Table 9-29. Rx Statistics Summary

Rx Statistic	Frame/Oct	Rx/Rx+Tx	Frame Type					Frame Size (bytes)								Event				
			MAC control		Data			< 64	64	65-127	128-255	256-511	512-1023	1024-rx_maxlen	> rx_maxlen	flow coll.	CRC error	align / code	over-run	addr disc.
			Pause frame	Non-pause	Multi-cast	Broad-cast	Unic-ast													
Good Rx Frames	F	Rx	(y	y	y	y	y)	n	(y	y	y	y	y	y)	n	-	n	n	-	n
Broadcast Rx Frames	F	Rx	(%	%	n	y)	n	n	(y	y	y	y	y	y)	n	-	n	n	-	n
Multicast Rx Frames	F	Rx	(%	%	y)	n	n	n	(y	y	y	y	y	y)	n	-	n	n	-	n
Pause Rx Frames	F	Rx	y	n	n	n	n	n	(y	y	y	y	y	y)	n	-	n	n	-	-
Rx CRC Errors	F	Rx	(y	y	y	y	y)	n	(y	y	y	y	y	y)	n	-	y	n	-	n

Table 9-29. Rx Statistics Summary (continued)

Rx Alignment/Code Errors	F	Rx	(y	y	y	y	y	y	n	(y	y	y	y	y	y	n	-	-	y	-	n
Over-sized Rx Frames	F	Rx	(y	y	y	y	y	y	n	n	n	n	n	n	n	y	-	n	n	-	n
Rx Jabbers	F	Rx	(y	y	y	y	y	y	n	n	n	n	n	n	n	y	-	(y	y	-	n
Undersized Rx Frames	F	Rx	n	n	(y	y	y	y	y	n	n	n	n	n	n	n	-	n	n	-	n
Rx Fragments	F	Rx	n	n	(y	y	y	y	y^	n	n	n	n	n	n	n	-	(y	y	-	-
Rx Overruns	F	Rx	(y	y	y	y	y	y	(y	y	y	y	y	y	y	y	-	-	-	y	n
64octet Frames	F	Rx+Tx	(y	y	y	y	y	y	n	y	n	n	n	n	n	n	-	-	-	-	n
65-127octet Frames	F	Rx+Tx	(y	y	y	y	y	y	n	n	y	n	n	n	n	n	-	-	-	-	n
128-255octet Frames	F	Rx+Tx	(y	y	y	y	y	y	n	n	n	y	n	n	n	n	-	-	-	-	n
256-511octet Frames	F	Rx+Tx	(y	y	y	y	y	y	n	n	n	n	y	n	n	n	-	-	-	-	n
512-1023octet Frames	F	Rx+Tx	(y	y	y	y	y	y	n	n	n	n	n	y	n	n	-	-	-	-	n
1024-UPoctet Frames	F	Rx+Tx	(y	y	y	y	y	y	n	n	n	n	n	n	y	n	-	-	-	-	n

Table 9-29. Rx Statistics Summary (continued)

Rx Octets	O	Rx	(y	y	y	y	y	y	n	(y	y	y	y	y	y)	n	-	n	n	-	n
Net Octets	O	Rx+Tx	(y	y	y	y	y	y	(y	y	y	y	y	y	y	y)	-	-	-	-	

1. “AND” is assumed horizontally across the table between all conditions which form the statistic (marked y or n) except where (y|y), meaning “OR” is indicated. Parentheses are significant.
2. “-“ indicates conditions which are ignored in the formations of the statistic.
3. Statistics marked “Rx+Tx” are formed by summing the Rx and Tx statistics, each of which is formed independently.
4. The non-pause column refers to all MAC control frames (i.e. frames with length/type=88.08) with opcodes other than 0x0001. The pauseframe column refers to MAC frames with the opcode=0x0001.
5. The multicast, broadcast and unicast columns in the table refer to non-MAC Control/non-pause frames (i.e. data frames)
6. “%” If either a MAC control frame or pause frame has a multicast or broadcast destination address then the appropriate statistics will be updated.
7. “%” If either a MAC control frame or pause frame has a multicast or broadcast destination address then the appropriate statistics will be updated.
8. “y^” Frame fragments are not counted if less than 8 bytes.
9. flow coll. are half-duplex collisions forced by the MAC to achieve flow-control. A collision will be forced during the first 8 bytes so should not show in frame fragments. Some of the ‘-’s in this column might in reality be ‘n’s.
10. The rx_overruns stat show above is for rx_mof_overruns and rx_sof_overruns added together.

Table 9-30. Tx Statistics Summary

Tx Statistic	Frame/Oct	Tx/Rx+Tx	Frame Type					Frame Size (bytes)						Event											
			MAC control		Data			64	65-127	128-255	256-511	512-1023	1024-1535	>1535	CRC error	Collision type					No carrier	Queued	Deferred	Underrun	
			Pause (MAC)	Any (CPU)	Multicast	Broadcast	Unicast									flow	1	2-15	16	late					
Good Tx Frames	F	Tx	(y	y	y	y	y	(y	y	y	y	y	y	y	y)	-	-	-	-	n	n	n	-	-	n
Broadcast Tx Frames	F	Tx	n	(%	n	y)	n	(y	y	y	y	y	y	y	y)	-	-	-	-	n	n	n	-	-	n
Multicast Tx Frames	F	Tx	(y	%	y)	n	n	(y	y	y	y	y	y	y	y)	-	-	-	-	n	n	n	-	-	n

Table 9-30. Tx Statistics Summary (continued)

Pause Tx Frames	F	Tx	y	n	n	n	n	y	n	n	n	n	n	n	-	-	-	-	-	-	-	-	-	
Collisions	F	Tx	n	(y	y	y	y)	(y	y	y	y	y	y	y)	-	(+	+	+	+	+	n	-	-	-
Single Collision Tx Frames	F	Tx	n	(y	y	y	y)	(y	y	y	y	y	y	y)	-	-	y	n	n	n	n	-	-	-
Multiple Collision Tx Frames	F	Tx	n	(y	y	y	y)	(y	y	y	y	y	y	y)	-	-	n	y	n	n	n	-	-	-
Excessive Collisions	F	Tx	n	(y	y	y	y)	(y	y	y	y	y	y	y)	-	-	n	n	y	n	n	-	-	-
Late Collisions	F	Tx	n	(y	y	y	y)	n	(y	y	y	y	y	y)	-	-	-	-	-	y	-	-	-	-
Deferred Tx Frames	F	Tx	n	(y	y	y	y)	(y	y	y	y	y	y	y)	-	-	n	n	n	n	n	-	y	n
Carrier Sense Errors	F	Tx	(y	y	y	y	y)	(y	y	y	y	y	y	y)	-	-	-	-	-	-	y	-	-	-

256-511 octect Frame s	F	Rx+ Tx	(y	y	y	y	y)	n	n	n	y	n	n	n	-	-	-	-	n	n	n	-	-	-
512-1023 octect Frame s	F	Rx+ Tx	(y	y	y	y	y)	n	n	n	n	y	n	n	-	-	-	-	n	n	n	-	-	-
1024-UP octect Frame s	F	Rx+ Tx	(y	y	y	y	y)	n	n	n	n	n	y	y	-	-	-	-	n	n	n	-	-	-
Tx Octect s	O	Tx	(y	y	y	y	y)	(y	y	y	y	y	y	y)	-	-	-	-	n	n	n	-	-	n
Net Octect s	O	Rx+ Tx	(y	y	y	y	y)	(y	y	y	y	y	y)	-	-	\$	\$	\$	\$	\$	\$	-	-	-

1. "AND" is assumed horizontally across the table between all conditions which form the statistic (marked y or n) except where (y|y), meaning "OR" is indicated. Parentheses are significant.
2. "-" indicates conditions which are ignored in the formations of the statistic.
3. Statistics marked "Rx+Tx" are formed by summing the Rx and Tx statistics, each of which is formed independently.
4. Pause(MAC) frames are issued in the MAC as perfect (no CRC error) 64 byte frames in full duplex only, so cannot collide
5. "%" If a CPU sourced MAC control frame has a multicast or broadcast destination address then the appropriate statistics will be updated.
6. "+" indicates collisions which are "summed" (i.e. every collision is counted in the Collisions statistic). Jam sequences used for half-duplex flow control are also counted.
7. "\$" Every byte written on the wire during each retry attempt is also counted in addition to frames which experience no collisions or carrier loss.

8. The flow collision type is for half-duplex collisions forced by the MAC to achieve flow control. Some of the '-'s in this column might in reality be 'n's. To prevent double-counting, Net Octects are unaffected by the jam sequence – the 'received' bytes, however, are counted. (see Rx Statistics table).
9. When the transmit Tx FIFO is drained due to the MAC being disabled or link being lost, then the frames being purged will not appear in the Tx statistics.

9.4.34 CPPI Streaming Packet Interface

The receive streaming interface on port 0 of the CPSW is responsible for receiving packet for Ethernet egress data from the packet streaming switch in the NAVSS. The CPPI receive port is equivalent to an Ethernet port with the difference being that the data is provided to the CPSW in the 128-bit streaming interface data format instead RGMII data format.

In addition to the packet data, the receive streaming interface also can provide additional control information that resides in the information words of the descriptor that was transmitted to the CPSW.

The tables below show the information that may be passed along with which descriptor information word to put it in.

9.4.34.1 Port 0 CPPI Transmit Packet Streaming Interface (CPSW_2G Egress)

INFO Word 0–3 and Status Data Word 0–3 (on EOP) are the only non-payload data word types that are transferred. Long packets are truncated at the CPWS0_PN_RX_MAXLEN_REG[13-0] RX_MAXLEN byte value of the ingress port (only the CPWS0_PN_RX_MAXLEN_REG number of bytes are kept if long packets are transferred due to CPWS0_PN_MAC_CONTROL_REG register copy error frames set - RX_CEF_EN). MAC control frames are only transferred if the receiving Ethernet port has the CPWS0_PN_MAC_CONTROL_REG[24] RX_CMF_EN bit set.

INFO Words are a contiguous block of four 32-bit data words aligned on a 32-bit word boundary.

Figure 9-13. TX INFO Word 0 Format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
RESERVED								FLOW_ID								

Bit	Field	Description
31-27	PKT_TYPE	Always set to 0b00111. Host PD (Packet Descriptor) Word 2. Packet Type: bits[31-27].
26-24	RESERVED	Reserved.
23	PASS_CRC	This bit is cleared to zero (no CRC passed) when the P0_TX_CRC_REMOVE bit in the CPSW_CONTROL_REG register is set (and the egress packet has no errors). When the remove bit is cleared to zero then this bit is cleared and no CRC is passed with the output packet. The packet length includes the CRC if it is present.
22	CRC_TYPE	The packet CRC type. The type of CRC passed is determined by CRC_TYPE field in the CPSW_PN_MAC_CONTROL_REG register (not by the type of CRC the packet had on Ethernet port ingress). Host PD Word 1. Protocol Specific Flags: bits[27-24]. 0h: Ethernet CRC 1h: Castagnoli CRC
21-8	RESERVED	Reserved.

Bit	Field	Description
7-0	FLOW_ID	This is the packet output transmit streaming interface flow. The default flow ID can be overridden by ALE classification (Thread mapping). The switch default flow is the 3-bit "From Port" value concatenated with the 3-bit "Switch Priority" {From_Port[2:0], Switch_Priority[2:0]} as shown below: Host PD (Packet Descriptor) Word 1. Flow ID: bits[13-0]. 0h: The packet was received on Ethernet port 1 1h: The packet was received on Ethernet port 2 Switch Priority – The actual hardware switch priority that the packet was stored in on the CPPI transmit FIFO.

0		PKT_LENGTH													

Bit	Field	Description
31-20	FIXED_PS_SIZE	Fixed ps size: 0x4
19-14	RESERVED	Reserved.
13-0 (Host PD (Packet Descriptor) Word 1. Packet Length: bits[21-0])	PKT_LENGTH	Specifies the number of bytes in the entire packet. Offset bytes are not included. Valid only on SOP. The packet length must be greater than zero. The packet data will be truncated to the packet length if the packet length is shorter than the sum of the packet buffer descriptor buffer lengths. A host error occurs if the packet length is greater than the sum of the packet buffer descriptor buffer lengths.

Bit	Field	Description
31-21	RESERVED	Reserved.
20	IPV4_VALID	An IPV4 TCP or UDP Packet was detected.
19	IPV6_VALID	An IPV6 TCP or UDP Packet was detected.
18	TCP_UDP_N	Valid only when either the IPV4_VALID or IPV6_VALID bits are set. 0h: Indicates UDP packet was detected. 1h: Indicates TCP packet was detected.
17	FRAGMENT	Indicates that an IP fragment was detected. Valid only when when either the IPV4_VALID or IPV6_VALID bits are set.
16	CHECKSUM_ERROR	Valid only when either the IPV4_VALID or IPV6_VALID bits are set.
15-0	CHECKSUM_ADD	This is the value that was summed during the checksum computation. This value is FFFFh for IPV4/6 UDP/TCP packets with no checksum error.

9.4.34.2 CPPI Receive Packet Streaming Interface (CPSW Ingress)

Info Word 0/1/2/3 (INFO1 and INFO3 are ignored) are transferred on SOP. If a timestamp word (Extended Packet Info Word 0/1/2/3) is to be transferred it must be after SOP and before any packet data is transferred. Any following non-data type words will be dropped. The EOP word must be payload data.

Input receive packets cannot be aborted by the host. The INFO Word bit descriptions and Extended Packet INFO Word bit descriptions are shown below. The PASS_CRC bit indicates that the CRC is passed with the packet data. Packets that have a passed CRC that is an error CRC will be output on the Ethernet port with at least one CRC byte inverted to indicate the error if P0_RX_PASS_CRC_ERR bit is set, otherwise they are dropped. The packet is a directed packet when any of the TO_PORT bits are nonzero. A packet may be directed only to a single port. The packet will be sent to the port number indicated. For directed packets the lookup process is skipped to determine the destination. However, in vlan aware mode (when VLAN_AWARE bit in the CPSW_CONTROL_REG register is set to 1h) the lookup is performed to determine untagged egress. Packets longer than the value in CPSW_P0_RX_MAXLEN_REG[13:0] RX_MAXLEN bit field are dropped. Packets shorter than 60-Bytes are padded to 64-Bytes (after adding pad and CRC) if P0_RX_PAD bit in the CPSW_CONTROL_REG register is set and if PASS_CRC is clear, otherwise they are dropped. This means that packets shorter than 64-Bytes are dropped if the PASS_CRC info bit is set regardless of P0_RX_PAD bit (packets are padded only if they are short and do not have CRC).

A RX INFO word is a contiguous block of four 32-bit data words aligned on a 32-bit word boundary.

Note

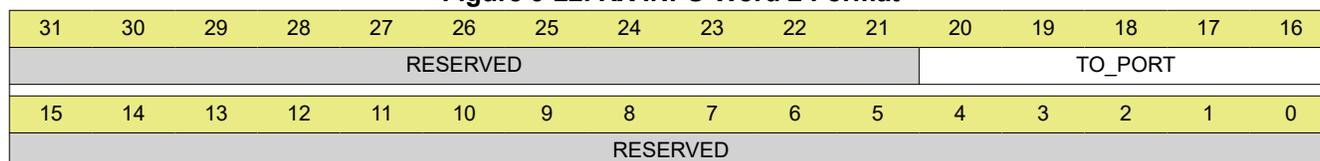

RX Control Data Words [0..2] are mapped to Host Packet Descriptor Protocol Specific Words if (TCHAN[a]_TCFG.tx_filt_pswords = 0) and (Host PD Word 1.Protocol Specific Region Location.bit[28] = 0h) and (Host PD Word 1.Protocol Specific Valid Word Count.bits[22-27] = 4h)

Figure 9-21. RX INFO Word 0 Format

RESERVED								PASS_CRC	CRC_T YPE	RESERVED					
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED															

Bit	Field	Description
31-24	RESERVED	Reserved.
23	PASS_CRC	The PASS_CRC bit indicates that the CRC is passed with the packet data. 0h: CRC is not passed with packet (CRC_TYPE is don't care) 1h: CRC of type CRC_TYPE is passed with the packet.
22 (Host PD Packet Descriptor) Word 1. Protocol Specific Flags: bits[27-24])	CRC_TYPE	CRC Type 0h: Ethernet CRC 1h: Castagnoli CRC

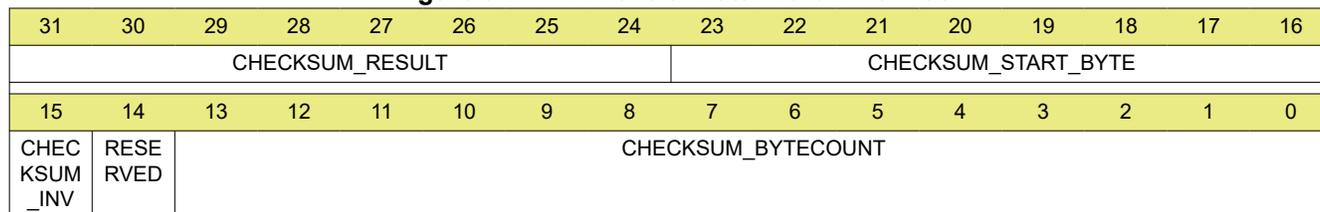

Bit	Field	Description
21-0	RESERVED	Reserved.

Figure 9-22. RX INFO Word 2 Format

Bit	Field	Description
31-21	RESERVED	Reserved.
20-16 (Host PD (Packet Descriptor) Word 3. Dest Tag Low bits[8-0])	TO_PORT	Port number to send the directed packet to. This field is set by the host. This field is valid on SOP. Directed packets go to the directed port, but an ALE lookup is performed to determine untagged egress in VLAN_AWARE mode. 0h: Not directed 1h: Send the packet to port 1.
15-0	RESERVED	Reserved.

Figure 9-23. RX Control Data Word 1 Format

Bit	Field	Description
31	TIMESTAMP_EN	When set, this bit indicates that the packet will generate a timesync event on Ethernet egress (if the CPTS is configured properly) with the associated DOMAIN, MSG_TYPE, and SEQUENCE_ID.
30-28	RESERVED	Reserved.
27-20	DOMAIN	Timesync domain.
19-16	MSG_TYPE	Timesync message type.
15-0	SEQUENCE_ID	Timesync sequence ID.

Figure 9-24. RX Control Data Word 2 Format

Bit	Field	Description
31-24	CHECKSUM_RESULT	This is the packet byte number where the checksum result will be placed in the egress packet. The first packet byte which is the first byte of the destination address is Byte 1 (not byte zero).

Bit	Field	Description
23-16	CHECKSUM_START_BYTE	This is the packet byte number to start the checksum calculation on. The first packet byte is Byte 1.
15	CHECKSUM_INV	When set, a zero checksum value will be inverted and sent as FFFFh.
14	RESERVED	Reserved.
13-0	CHECKSUM_BYTECOUNT	This is the number of bytes to calculate the checksum on. The outgoing Ethernet packet will have a checksum inserted when this value is non-zero.

Other INFO words are not taken into account.

9.4.34.3 CPPI Checksum Offload

The CPPI host port can be enabled to perform checksum offload on host port packet ingress and egress. UDP (User Datagram Protocol) and TCP (Transmission Control Protocol) over IPV4 and IPV6 are supported. For the purposes of checksum description, the first packet byte (the first byte of the destination address) is byte 1 (not byte 0). That is, a 64 byte packet goes from byte 1 to byte 64. For all packet types, the S_CN_SWITCH bit in the CPSW_CONTROL_REG register must be set for the Outer VLAN L type to be supported.

9.4.34.3.1 CPPI Transmit Checksum Offload

IPV4 and IPV6 UDP and TCP packets that are received on any Ethernet port and destined for port 0 egress are checked for correct checksum as described below. The byte counts below are shown for packets with no VLAN's. The byte counts vary with one or two packet VLAN's. Packets received on an Ethernet port with errors are not checked for a correct checksum if they are passed to the host.

9.4.34.3.1.1 IPV4 UDP

- Byte 15 Upper Nibble = 4 for IPV4
- Byte 15 Lower Nibble = IHL - Nibble with number of 32-bit words in IPV4 header (5 to 15 supported).
- Bytes 20-21 = fragment[15-0] – Bit 13 is the MF bit and bits [12-0] are the Fragment offset. A packet is a fragment if the MF bit is set or if the fragment offset is non-zero. The first packet fragment has MF=1 with a zero offset. Middle fragments have MF=1 with a nonzero offset. The last packet fragment has MF=0 with a nonzero offset. Non-fragmented packets have MF=0 and a zero offset. A count is output for packet fragments but no errors are reported. First fragments have the UDP header included in the count. Middle and last fragments have only data included in the count (there is no UDP header).
- Byte 24 = 0x11 for UDP protocol.
- Received packet UDP checksum of zero means that there is no IPV4 checksum sent with the packet so no error will be issued.
- Received packet UDP checksum of 0xFFFF means that the checksum was calculated to be 0xFFFF or 0x0000 but was sent in the transmitted packet as 0xFFFF by the sending originating entity.

9.4.34.3.1.2 IPV4 TCP

- Byte 15 Upper Nibble = 4 for IPV4
- Byte 15 Lower Nibble = IHL - Nibble with number of 32-bit words in IPV4 header (5 to 15 supported).
- Bytes 20-21 = fragment[15-0] – Bit 13 is the MF bit and bits [12-0] are the Fragment offset. A packet is a fragment if the MF bit is set or if the fragment offset is non-zero. The first packet fragment has MF=1 with a zero offset. Middle fragments have MF=1 with a nonzero offset. The last packet fragment has MF=0 with a nonzero offset. Non-fragmented packets have MF=0 and a zero offset. A count is output for packet fragments but no errors are reported. First fragments have the UDP header included in the count. Middle and last fragments have only data included in the count (there is no TCP header).
- Byte 24 = 0x06 for TCP protocol.

9.4.34.3.1.3 IPV6 UDP

- Byte 15 upper nibble = 6 for IPV6.
- Byte 21 = 0x11 for UDP protocol as next header.

- Fragment extension headers are supported. First fragments have a fragment extension header (byte 21 = 0x2C) followed by a UDP header (byte 55 = 0x11). Middle and last fragments have a fragment extension header followed by data only (no UDP header). The first packet fragment has MF=1 with a zero offset. Middle fragments have MF=1 with a nonzero offset. The last packet fragment has MF=0 with a nonzero offset. Non-fragmented packets do not have a fragment extension header. A count is output for packet fragments but no errors are reported.
- Received packet UDP checksum of zero means that there is no IPV6 checksum sent with the packet so no error will be issued.
- Received packet UDP checksum of 0xFFFF means that the checksum was calculated to be 0xFFFF or 0x0000 but was sent in the transmitted packet as 0xFFFF by the sending originating entity.

9.4.34.3.1.4 IPV6 TCP

- Byte 15 upper nibble = 6 for IPV6.
- Byte 21 = 0x06 for TCP protocol as next header.
- Fragment extension headers are supported. First fragments have a fragment extension header (byte 21 = 0x2C) followed by a UDP header (byte 55 = 0x06). Middle and last fragments have a fragment extension header followed by data only (no TCP header). The first packet fragment has MF=1 with a zero offset. Middle fragments have MF=1 with a nonzero offset. The last packet fragment has MF=0 with a nonzero offset. Non-fragmented packets do not have a fragment extension header. A count is output for packet fragments but no errors are reported.

9.4.34.4 CPPI Receive Checksum Offload

Packets sent from host port 0 (switch ingress) to any Ethernet port can have a checksum calculated and inserted into the Ethernet egress packet. The RX_CHECKSUM_EN bit in the CPSW_P0_CONTROL_REG register must be set for receive checksum operation to be enabled. When bit RX_CHECKSUM_EN is enabled, Control Data Word 2 input on CPPI receive PSI interface determines how the checksum is calculated. The CHECKSUM_RESULT field in Control Data Word 2 determines where the checksum is inserted. The checksum result location is adjusted by the egress port if a VLAN is to be inserted or removed on Ethernet port egress.

9.4.35 Egress Packet Operations

Note

InterVLAN routing is supported on SR2.0 only.

Each CPSW egress port (Ethernet and Host) is capable of performing egress packet processing operations. IntraVLAN processing either adds, removes, or replaces VLAN information or does nothing. InterVLAN routing allows hardware routing between a limited number of VLANs - thereby allowing high-bandwidth or other routing operations to be offloaded from software to the CPSW (hardware). IntraVLAN processing and InterVLAN routing operations are mutually exclusive. In addition, the packet source and destination addresses can be swapped on egress to facilitate OAM or generic testing operations.

9.5 MCU_CPSW0 Programming Guide

9.5.1 Initialization and Configuration of CPSW Subsystem

To configure the CPSW Ethernet Subsystem for operation, the host must perform the following:

1. Select the Interface (RMII, or RGMII) Mode. See the CTRLMMR_MCU_ENET_CTRL[1-0] MODE_SEL register.
2. Configure pads (pin muxing), as per the interface selected. Refer to *Pad Configuration Registers* and the device-specific Datasheet.
3. Enable the CPSW Ethernet Subsystem clocks. See [Section 9.3, CPSW Integration](#)
4. Ensure that at least 2000 CPPI_ICLK periods are run after reset is de-asserted.
5. Configure the CPSW_CONTROL_REG register
6. Configure the Ethernet Port Source Address registers (CPSW0_PN_SA_L_REG and CPSW_PN_SA_H_REG)
7. Configure the CPSW statistic port enable register CPSW_STAT_PORT_EN_REG

8. Configure the ALE ([Section 9.4.7.1, Address Lookup Engine](#))
9. Configure the MDIO ([Section 9.5.3.1, Initializing the MDIO Module](#))
10. Configure Ethernet port, as per the desired mode of operations

9.5.2 CPSW Reset

To reset the CPMAC_SL, the host must perform the following:

1. Set CMD_IDLE in the Ethernet port CPSW_PN_MAC_CONTROL_REG register
2. Wait for IDLE to be indicated in the Ethernet port CPSW_PN_MAC_STATUS_REG register
3. Configure the Ethernet ports.

9.5.3 MDIO Software Interface

9.5.3.1 Initializing the MDIO Module

The following steps are performed by the application software or device driver to initialize the MDIO device:

1. Configure the PREAMBLE and CLKDIV bits in the MDIO Control register (CPSW_MDIO_CONTROL_REG).
2. Enable the MDIO module by setting the ENABLE bit in CPSW_MDIO_CONTROL_REG.
3. The MDIO PHY alive status register (MDIO CPSW_MDIO_ALIVE_REG) can be read in polling fashion until a PHY connected to the system responded, and the MDIO PHY link status register (MDIO CPSW_MDIO_LINK_REG) can determine whether this PHY already has a link.
4. Set the appropriate PHY addresses in the MDIO user PHY select register (CPSW_MDIO_USER_PHY_SEL_REG_k, where k = 0 or 1), and set the LINKINT_ENABLE bit to enable a link change event interrupt if desirable.
5. Set the appropriate LINKSEL bit in the CPSW_MDIO_USER_PHY_SEL_REG_k register (where k = 0 or 1).
6. Set the appropriate USERINTMASKSET bit field in the CPSW_MDIO_USER_INT_MASK_SET_REG register.
7. If an interrupt on general MDIO register access is desired, set the corresponding bit in the MDIO user command complete interrupt mask set register (MDIO CPSW_MDIO_USER_INT_MASK_SET_REG) to use the MDIO user access register (MDIO CPSW_MDIO_USER_ACCESS_REG_k, where k = 0 or 1).

9.5.3.2 Writing Data To a PHY Register

The MDIO module includes a user access register (MDIO CPSW_MDIO_USER_ACCESS_REG_k, where k = 0 or 1) to directly access a specified PHY device. To write a PHY register, perform the following:

1. Check to ensure that the GO bit in the MDIO user access register (MDIO CPSW_MDIO_USER_ACCESS_REG_k) is cleared.
2. Write to the GO, WRITE, REGADR, PHYADR, and DATA bits in MDIO CPSW_MDIO_USER_ACCESS_REG_k corresponding to the PHY and PHY register SW wants to write.
3. The write operation to the PHY is scheduled and completed by the MDIO module. Completion of the write operation can be determined by polling the GO bit in MDIO CPSW_MDIO_USER_ACCESS_REG_k for a 0.
4. Completion of the operation sets the corresponding USERINTRAW bit (0 or 1) in the MDIO user command complete interrupt register (CPSW_MDIO_USER_INT_RAW_REG) corresponding to MDIO CPSW_MDIO_USER_ACCESS_REG_k used. If interrupts have been enabled on this bit using the MDIO user command complete interrupt mask set register (CPSW_MDIO_USER_INT_MASK_SET_REG), then the bit is also set in the MDIO user command complete interrupt register (CPSW_MDIO_USER_INT_MASKED_REG) and an interrupt is triggered on the host processor.

9.5.3.3 Reading Data From a PHY Register

The MDIO module includes a user access register (MDIO CPSW_MDIO_USER_ACCESS_REG_k, where k = 0 or 1) to directly access a specified PHY device. To read a PHY register, perform the following:

1. Check to ensure that the GO bit in the MDIO user access register (CPSW_MDIO_USER_ACCESS_REG_k, where k = 0 or 1) is cleared.
2. Write to the GO, REGADR, and PHYADR bits in the CPSW_MDIO_USER_ACCESS_REG_k register corresponding to the PHY and PHY register SW wants to read.

3. The read data value is available in the DATA bit field in MDIO CPSW_MDIO_USER_ACCESS_REG_k register after the module completes the read operation on the serial bus. Completion of the read operation can be determined by polling the GO and ACK bits in CPSW_MDIO_USER_ACCESS_REG_k register. After the GO bit has cleared, the ACK bit is set on a successful read.
4. Completion of the operation sets the corresponding USERINTRAW bit (0 or 1) in the MDIO user command complete interrupt register (CPSW_MDIO_USER_INT_RAW_REG) corresponding to MDIO CPSW_MDIO_USER_ACCESS_REG_k used. If interrupts have been enabled on this bit using the MDIO user command complete interrupt mask set register (CPSW_MDIO_USER_INT_MASK_SET_REG), then the bit is also set in the MDIO user command complete interrupt register (CPSW_MDIO_USER_INT_MASKED_REG) and an interrupt is triggered on the host processor.

9.6 MSS_CPSW Registers

Table 9-31 lists the memory-mapped registers for the MSS_CPSW registers. All register offset addresses not listed in Table 9-31 should be considered as reserved locations and the register contents should not be modified.

Complex bit access types are encoded to fit into small table cells. [Table 9-32](#) shows the codes that are used for access types in this section.

Table 9-32. MSS_CPSW Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
W1S	W 1S	Write 1 to set
Wdecr	W decr	Write
Wincr	W incr	Write
Reset or Default Value		
-n		Value after reset or the default value
Register Array Variables		
i,j,k,l,m,n		When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula.
y		When this variable is used in a register name, an offset, or an address it refers to the value of a register array.

9.6.1 SS_IDVER_REG Register (Offset = 0h) [Reset = 6BA00102h]

SS_IDVER_REG is shown in [Table 9-33](#).

Return to the [Summary Table](#).

SS ID Version Register

Table 9-33. SS_IDVER_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	IDENT	R	6BA0h	Identification value
15-11	RTL_VER	R	0h	RTL version value
10-8	MAJOR_VER	R	1h	Major version value
7-0	MINOR_VER	R	2h	Minor version value

9.6.2 SS_SYNCE_COUNT_REG Register (Offset = 4h) [Reset = 0000000h]

SS_SYNCE_COUNT_REG is shown in [Table 9-34](#).

Return to the [Summary Table](#).

SS SYNCE Count Register

Table 9-34. SS_SYNCE_COUNT_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	SYNCE_CNT	R/W	0h	Sync E Count Value

9.6.3 SS_SYNCE_MUX_REG Register (Offset = 8h) [Reset = X]

SS_SYNCE_MUX_REG is shown in [Table 9-35](#).

Return to the [Summary Table](#).

SS Synce Mux Register

Table 9-35. SS_SYNCE_MUX_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-6	RESERVED	R/W	X	
5-0	SYNCE_SEL	R/W	0h	Sync E Select Value

9.6.4 SS_CONTROL_REG Register (Offset = Ch) [Reset = X]

SS_CONTROL_REG is shown in [Table 9-36](#).

Return to the [Summary Table](#).

SS Control Register

Table 9-36. SS_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	X	
1	EEE_PHY_ONLY	R/W	0h	Energy Efficient Enable Phy Only Mode: 0=The low power indicate state includes gating off the CPPI_GCLK to the CPSW, 1=The low power indicate state does not gate the clock to the CPSW
0	EEE_EN	R/W	0h	Energy Efficient Ethernet Enable: 0=EEE is disabled, 1=EEE is enabled

9.6.5 SS_INT_CONTROL_REG Register (Offset = 18h) [Reset = X]

SS_INT_CONTROL_REG is shown in [Table 9-37](#).

Return to the [Summary Table](#).

SS Interrupt Control Register

Table 9-37. SS_INT_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	INT_TEST	R/W	0h	Interrupt Test
30-22	RESERVED	R/W	X	
21-16	INT_BYPASS	R/W	0h	Interrupt Bypass Value
15-12	RESERVED	R/W	X	
11-0	INT_PRESCALE	R/W	0h	Interrupt Prescale Value

9.6.6 SS_STATUS_REG Register (Offset = 1Ch) [Reset = X]

SS_STATUS_REG is shown in [Table 9-38](#).

Return to the [Summary Table](#).

SS Status Register

Table 9-38. SS_STATUS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-1	RESERVED	R	X	
0	EEE_CLKSTOP_ACK	R	0h	Energy Efficient Ethernet clockstop acknowledge from CPSW

9.6.7 SS_RGMI1_STATUS_REG Register (Offset = 30h) [Reset = X]

SS_RGMI1_STATUS_REG is shown in [Table 9-39](#).

Return to the [Summary Table](#).

RGMI1 Status Register

Table 9-39. SS_RGMI1_STATUS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-4	RESERVED	R	X	
3	FULLDUPLEX	R	0h	Rgmii full dulex: 0=Half-duplex, 1=Full-duplex
2-1	SPEED	R	0h	Rgmii1 speed: 00=10Mbps, 01=100Mbps, 10=1000Mbps, 11=reserved
0	LINK	R	0h	Rgmii1 link indicator: 0=Link is down, 1=Link is up

9.6.8 SS_TH_THRESH_PULSE_EN_REG Register (Offset = 80h) [Reset = X]

SS_TH_THRESH_PULSE_EN_REG is shown in [Table 9-40](#).

Return to the [Summary Table](#).

THost Threshold Pulse Interrupt Enable Register

Table 9-40. SS_TH_THRESH_PULSE_EN_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R/W	X	
7-0	TH_THRESH_PULSE_EN	R/W	0h	THost Threshold Pulse Interrupt Enable Register

9.6.9 SS_TH_PULSE_EN_REG Register (Offset = 84h) [Reset = X]

SS_TH_PULSE_EN_REG is shown in [Table 9-41](#).

Return to the [Summary Table](#).

THost Pulse Interrupt Enable Register

Table 9-41. SS_TH_PULSE_EN_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R/W	X	
7-0	TH_PULSE_EN	R/W	0h	THost Pulse Interrupt Enable Register

9.6.10 SS_FH_PULSE_EN_REG Register (Offset = 88h) [Reset = X]

SS_FH_PULSE_EN_REG is shown in [Table 9-42](#).

Return to the [Summary Table](#).

FHost Pulse Interrupt Enable Register

Table 9-42. SS_FH_PULSE_EN_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R/W	X	
7-0	FH_PULSE_EN	R/W	0h	FHost Pulse Interrupt Enable Register

9.6.11 SS_MISC_EN_REG Register (Offset = 8Ch) [Reset = X]

SS_MISC_EN_REG is shown in [Table 9-43](#).

Return to the [Summary Table](#).

Misc Interrupt Enable Register

Table 9-43. SS_MISC_EN_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R/W	X	
6	DED_PEND_EN	R/W	0h	MISC DED Memory Protect Error Interrupt Enable
5	SEC_PEND_EN	R/W	0h	MISC SEC Memory Protect Error Interrupt Enable
4	EVNT_PEND_EN	R/W	0h	MISC CPTS Event Interrupt Enable
3	STAT_PEND_EN	R/W	0h	MISC Statistics Interrupt Enable - OR of bits n downto 0
2	HOST_PEND_EN	R/W	0h	MISC Host Interrupt Enable
1	MDIO_LINKINT_EN	R/W	0h	MISC MDIO linkint - OR of bits 1 and 0
0	MDIO_USERINT_EN	R/W	0h	MISC_MDIO userint interrupt enable - OR of bits 1 and 0

9.6.12 SS_TH_THRESH_PULSE_STATUS_REG Register (Offset = B0h) [Reset = X]

SS_TH_THRESH_PULSE_STATUS_REG is shown in [Table 9-44](#).

Return to the [Summary Table](#).

THost Threshold Pulse Interrupt Status Register

Table 9-44. SS_TH_THRESH_PULSE_STATUS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-8	RESERVED	R	X	
7-0	TH_THRESH_PULSE_STA TUS	R	0h	THost Threshold Pulse Interrupt Status Register

9.6.13 SS_TH_PULSE_STATUS_REG Register (Offset = B4h) [Reset = X]

SS_TH_PULSE_STATUS_REG is shown in [Table 9-45](#).

Return to the [Summary Table](#).

THost Pulse Interrupt Status Register

Table 9-45. SS_TH_PULSE_STATUS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description

9.6.246 TEST_CPDMA_TH4_CP_REG Register (Offset = 00034370h) [Reset = 00000000h]

TEST_CPDMA_TH4_CP_REG is shown in [Table 9-278](#).

Return to the [Summary Table](#).

Test CPDMA THost Channel 4 Completion Pointer

Table 9-278. TEST_CPDMA_TH4_CP_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TEST_TH4_CP	R/W	0h	Test CPDMA THost Channel 4 Completion Pointer

9.6.247 TEST_CPDMA_TH5_CP_REG Register (Offset = 00034374h) [Reset = 00000000h]

TEST_CPDMA_TH5_CP_REG is shown in [Table 9-279](#).

Return to the [Summary Table](#).

Test CPDMA THost Channel 5 Completion Pointer

Table 9-279. TEST_CPDMA_TH5_CP_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TEST_TH5_CP	R/W	0h	Test CPDMA THost Channel 5 Completion Pointer

9.6.248 TEST_CPDMA_TH6_CP_REG Register (Offset = 00034378h) [Reset = 00000000h]

TEST_CPDMA_TH6_CP_REG is shown in [Table 9-280](#).

Return to the [Summary Table](#).

Test CPDMA THost Channel 6 Completion Pointer

Table 9-280. TEST_CPDMA_TH6_CP_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TEST_TH6_CP	R/W	0h	Test CPDMA THost Channel 6 Completion Pointer

9.6.249 TEST_CPDMA_TH7_CP_REG Register (Offset = 0003437Ch) [Reset = 00000000h]

TEST_CPDMA_TH7_CP_REG is shown in [Table 9-281](#).

Return to the [Summary Table](#).

Test CPDMA THost Channel 7 Completion Pointer

Table 9-281. TEST_CPDMA_TH7_CP_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TEST_TH7_CP	R/W	0h	Test CPDMA THost Channel 7 Completion Pointer

9.6.250 RXGOODFRAMES Register (Offset = 0003A000h) [Reset = 00000000h]

RXGOODFRAMES is shown in [Table 9-282](#).

Return to the [Summary Table](#).

Total number of good frames received

Table 9-282. RXGOODFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good frames received

9.6.251 RXBROADCASTFRAMES Register (Offset = 0003A004h) [Reset = 00000000h]

RXBROADCASTFRAMES is shown in [Table 9-283](#).

Return to the [Summary Table](#).

Total number of good broadcast frames received

Table 9-283. RXBROADCASTFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good broadcast frames received

9.6.252 RXMULTICASTFRAMES Register (Offset = 0003A008h) [Reset = 00000000h]

RXMULTICASTFRAMES is shown in [Table 9-284](#).

Return to the [Summary Table](#).

Total number of good multicast frames received

Table 9-284. RXMULTICASTFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good multicast frames received

9.6.253 RXCRCERRORS Register (Offset = 0003A010h) [Reset = 00000000h]

RXCRCERRORS is shown in [Table 9-285](#).

Return to the [Summary Table](#).

Total number of CRC errors frames received

Table 9-285. RXCRCERRORS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of CRC errors frames received

9.6.254 RXOVERSIZEDFRAMES Register (Offset = 0003A018h) [Reset = 00000000h]

RXOVERSIZEDFRAMES is shown in [Table 9-286](#).

Return to the [Summary Table](#).

Total number of oversized frames received

Table 9-286. RXOVERSIZEDFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of oversized frames received

9.6.255 RXUNDERSIZEDFRAMES Register (Offset = 0003A020h) [Reset = 00000000h]

RXUNDERSIZEDFRAMES is shown in [Table 9-287](#).

Return to the [Summary Table](#).

Total number of undersized frames received

Table 9-287. RXUNDERSIZEDFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of undersized frames received

9.6.256 RXFRAGMENTS Register (Offset = 0003A024h) [Reset = 00000000h]

RXFRAGMENTS is shown in [Table 9-288](#).

Return to the [Summary Table](#).

Total number of fragmented frames received

Table 9-288. RXFRAGMENTS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of fragmented frames received

9.6.257 ALE_DROP Register (Offset = 0003A028h) [Reset = 00000000h]

ALE_DROP is shown in [Table 9-289](#).

Return to the [Summary Table](#).

Total number of frames dropped by the ALE

Table 9-289. ALE_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames dropped by the ALE

9.6.258 ALE_OVERRUN_DROP Register (Offset = 0003A02Ch) [Reset = 0000000h]

ALE_OVERRUN_DROP is shown in [Table 9-290](#).

Return to the [Summary Table](#).

Total number of overrun frames dropped by the ALE

Table 9-290. ALE_OVERRUN_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of overrun frames dropped by the ALE

9.6.259 RXOCTETS Register (Offset = 0003A030h) [Reset = 00000000h]

RXOCTETS is shown in [Table 9-291](#).

Return to the [Summary Table](#).

Total number of received bytes in good frames

Table 9-291. RXOCTETS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of received bytes in good frames

9.6.260 TXGOODFRAMES Register (Offset = 0003A034h) [Reset = 00000000h]

TXGOODFRAMES is shown in [Table 9-292](#).

Return to the [Summary Table](#).

Total number of good frames transmitted

Table 9-292. TXGOODFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good frames transmitted

9.6.261 TXBROADCASTFRAMES Register (Offset = 0003A038h) [Reset = 0000000h]

TXBROADCASTFRAMES is shown in [Table 9-293](#).

Return to the [Summary Table](#).

Total number of good broadcast frames transmitted

Table 9-293. TXBROADCASTFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good broadcast frames transmitted

9.6.262 TXMULTICASTFRAMES Register (Offset = 0003A03Ch) [Reset = 00000000h]

TXMULTICASTFRAMES is shown in [Table 9-294](#).

Return to the [Summary Table](#).

Total number of good multicast frames transmitted

Table 9-294. TXMULTICASTFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good multicast frames transmitted

9.6.263 TXSINGLECOLLFRAMES Register (Offset = 0003A04Ch) [Reset = 0000000h]

TXSINGLECOLLFRAMES is shown in [Table 9-295](#).

Return to the [Summary Table](#).

Total number of transmitted frames experiencing a single collision

Table 9-295. TXSINGLECOLLFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of transmitted frames experiencing a single collision

9.6.264 TXMULTCOLLFRAMES Register (Offset = 0003A050h) [Reset = 00000000h]

TXMULTCOLLFRAMES is shown in [Table 9-296](#).

Return to the [Summary Table](#).

Total number of transmitted frames experiencing multiple collisions

Table 9-296. TXMULTCOLLFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of transmitted frames experiencing multiple collisions

9.6.265 TXOCTETS Register (Offset = 0003A064h) [Reset = 00000000h]

TXOCTETS is shown in [Table 9-297](#).

Return to the [Summary Table](#).

Total number of bytes in all good frames transmitted

Table 9-297. TXOCTETS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of bytes in all good frames transmitted

9.6.266 OCTETFRAMES64 Register (Offset = 0003A068h) [Reset = 00000000h]

OCTETFRAMES64 is shown in [Table 9-298](#).

Return to the [Summary Table](#).

Total number of 64-byte frames received and transmitted

Table 9-298. OCTETFRAMES64 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of 64-byte frames received and transmitted

9.6.267 OCTETFRAMES65T127 Register (Offset = 0003A06Ch) [Reset = 00000000h]

OCTETFRAMES65T127 is shown in [Table 9-299](#).

Return to the [Summary Table](#).

Total number of frames of size 65 to 127 bytes received and transmitted

Table 9-299. OCTETFRAMES65T127 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 65 to 127 bytes received and transmitted

9.6.268 OCTETFRAMES128T255 Register (Offset = 0003A070h) [Reset = 00000000h]

OCTETFRAMES128T255 is shown in [Table 9-300](#).

Return to the [Summary Table](#).

Total number of frames of size 128 to 255 bytes received and transmitted

Table 9-300. OCTETFRAMES128T255 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 128 to 255 bytes received and transmitted

9.6.269 OCTETFRAMES256T511 Register (Offset = 0003A074h) [Reset = 00000000h]

OCTETFRAMES256T511 is shown in [Table 9-301](#).

Return to the [Summary Table](#).

Total number of frames of size 256 to 511 bytes received and transmitted

Table 9-301. OCTETFRAMES256T511 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 256 to 511 bytes received and transmitted

9.6.270 OCTETFRAMES512T1023 Register (Offset = 0003A078h) [Reset = 00000000h]

OCTETFRAMES512T1023 is shown in [Table 9-302](#).

Return to the [Summary Table](#).

Total number of frames of size 512 to 1023 bytes received and transmitted

Table 9-302. OCTETFRAMES512T1023 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 512 to 1023 bytes received and transmitted

9.6.271 OCTETFRAMES1024TUP Register (Offset = 0003A07Ch) [Reset = 00000000h]

OCTETFRAMES1024TUP is shown in [Table 9-303](#).

Return to the [Summary Table](#).

Total number of frames of size 1024 to rx_maxlen bytes received and 1024 bytes or greater transmitted

Table 9-303. OCTETFRAMES1024TUP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 1024 to rx_maxlen bytes received and 1024 bytes or greater transmitted

9.6.272 NETOCTETS Register (Offset = 0003A080h) [Reset = 00000000h]

NETOCTETS is shown in [Table 9-304](#).

Return to the [Summary Table](#).

Total number of bytes received and transmitted

Table 9-304. NETOCTETS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of bytes received and transmitted

9.6.273 RX_BOTTOM_OF_FIFO_DROP Register (Offset = 0003A084h) [Reset = 00000000h]

RX_BOTTOM_OF_FIFO_DROP is shown in [Table 9-305](#).

Return to the [Summary Table](#).

Receive Bottom of FIFO Drop

Table 9-305. RX_BOTTOM_OF_FIFO_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Receive Bottom of FIFO Drop

9.6.274 PORTMASK_DROP Register (Offset = 0003A088h) [Reset = 00000000h]

PORTMASK_DROP is shown in [Table 9-306](#).

Return to the [Summary Table](#).

Total number of dropped frames received due to portmask

Table 9-306. PORTMASK_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames received due to portmask

9.6.275 RX_TOP_OF_FIFO_DROP Register (Offset = 0003A08Ch) [Reset = 0000000h]

RX_TOP_OF_FIFO_DROP is shown in [Table 9-307](#).

Return to the [Summary Table](#).

Receive Top of FIFO Drop

Table 9-307. RX_TOP_OF_FIFO_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Receive Top of FIFO Drop

9.6.276 ALE_RATE_LIMIT_DROP Register (Offset = 0003A090h) [Reset = 00000000h]

ALE_RATE_LIMIT_DROP is shown in [Table 9-308](#).

Return to the [Summary Table](#).

Total number of dropped frames due to ALE Rate Limiting

Table 9-308. ALE_RATE_LIMIT_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE Rate Limiting

9.6.277 ALE_VID_INGRESS_DROP Register (Offset = 0003A094h) [Reset = 00000000h]

ALE_VID_INGRESS_DROP is shown in [Table 9-309](#).

Return to the [Summary Table](#).

Total number of dropped frames due to ALE VID Ingress

Table 9-309. ALE_VID_INGRESS_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE VID Ingress

9.6.278 ALE_DA_EQ_SA_DROP Register (Offset = 0003A098h) [Reset = 00000000h]

ALE_DA_EQ_SA_DROP is shown in [Table 9-310](#).

Return to the [Summary Table](#).

Total number of dropped frames due to DA=SA

Table 9-310. ALE_DA_EQ_SA_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to DA=SA

9.6.279 ALE_BLOCK_DROP Register (Offset = 0003A09Ch) [Reset = 00000000h]

ALE_BLOCK_DROP is shown in [Table 9-311](#).

Return to the [Summary Table](#).

Total number of dropped frames due to ALE Block Mode

Table 9-311. ALE_BLOCK_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE Block Mode

9.6.280 ALE_SECURE_DROP Register (Offset = 0003A0A0h) [Reset = 00000000h]

ALE_SECURE_DROP is shown in [Table 9-312](#).

Return to the [Summary Table](#).

Total number of dropped frames due to ALE Secure Mode

Table 9-312. ALE_SECURE_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE Secure Mode

9.6.281 ALE_AUTH_DROP Register (Offset = 0003A0A4h) [Reset = 00000000h]

ALE_AUTH_DROP is shown in [Table 9-313](#).

Return to the [Summary Table](#).

Total number of dropped frames due to ALE Authentication

Table 9-313. ALE_AUTH_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE Authentication

9.6.282 ALE_UNKN_UNI Register (Offset = 0003A0A8h) [Reset = 00000000h]

ALE_UNKN_UNI is shown in [Table 9-314](#).

Return to the [Summary Table](#).

ALE Receive Unknown Unicast

Table 9-314. ALE_UNKN_UNI Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Unicast

9.6.283 ALE_UNKN_UNI_BCNT Register (Offset = 0003A0ACh) [Reset = 00000000h]

ALE_UNKN_UNI_BCNT is shown in [Table 9-315](#).

Return to the [Summary Table](#).

ALE Receive Unknown Unicast Bytecount

Table 9-315. ALE_UNKN_UNI_BCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Unicast Bytecount

9.6.284 ALE_UNKN_MLT Register (Offset = 0003A0B0h) [Reset = 00000000h]

ALE_UNKN_MLT is shown in [Table 9-316](#).

Return to the [Summary Table](#).

ALE Receive Unknown Multicast

Table 9-316. ALE_UNKN_MLT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Multicast

9.6.285 ALE_UNKN_MLT_BCNT Register (Offset = 0003A0B4h) [Reset = 00000000h]

ALE_UNKN_MLT_BCNT is shown in [Table 9-317](#).

Return to the [Summary Table](#).

ALE Receive Unknown Multicast Bytecount

Table 9-317. ALE_UNKN_MLT_BCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Multicast Bytecount

9.6.286 ALE_UNKN_BRD Register (Offset = 0003A0B8h) [Reset = 00000000h]

ALE_UNKN_BRD is shown in [Table 9-318](#).

Return to the [Summary Table](#).

ALE Receive Unknown Broadcast

Table 9-318. ALE_UNKN_BRD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Broadcast

9.6.287 ALE_UNKN_BRD_BCNT Register (Offset = 0003A0BCh) [Reset = 0000000h]

ALE_UNKN_BRD_BCNT is shown in [Table 9-319](#).

Return to the [Summary Table](#).

ALE Receive Unknown Broadcast Bytecount

Table 9-319. ALE_UNKN_BRD_BCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Broadcast Bytecount

9.6.288 ALE_POL_MATCH Register (Offset = 0003A0C0h) [Reset = 00000000h]

ALE_POL_MATCH is shown in [Table 9-320](#).

Return to the [Summary Table](#).

ALE Policer Matched

Table 9-320. ALE_POL_MATCH Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Policer Matched

9.6.289 ALE_POL_MATCH_RED Register (Offset = 0003A0C4h) [Reset = 00000000h]

ALE_POL_MATCH_RED is shown in [Table 9-321](#).

Return to the [Summary Table](#).

ALE Policer Matched and Condition Red

Table 9-321. ALE_POL_MATCH_RED Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Policer Matched and Condition Red

9.6.290 ALE_POL_MATCH_YELLOW Register (Offset = 0003A0C8h) [Reset = 00000000h]

ALE_POL_MATCH_YELLOW is shown in [Table 9-322](#).

Return to the [Summary Table](#).

ALE Policer Matched and Condition Yellow

Table 9-322. ALE_POL_MATCH_YELLOW Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Policer Matched and Condition Yellow

9.6.291 ALE_MULT_SA_DROP Register (Offset = 0003A0CCh) [Reset = 00000000h]

ALE_MULT_SA_DROP is shown in [Table 9-323](#).

Return to the [Summary Table](#).

ALE Multicast Source Address Drop

Table 9-323. ALE_MULT_SA_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Multicast Source Address drop

9.6.292 ALE_DUAL_VLAN_DROP Register (Offset = 0003A0D0h) [Reset = 00000000h]

ALE_DUAL_VLAN_DROP is shown in [Table 9-324](#).

Return to the [Summary Table](#).

ALE Dual VLAN Drop

Table 9-324. ALE_DUAL_VLAN_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Dual VLAN drop

9.6.293 ALE_LEN_ERROR_DROP Register (Offset = 0003A0D4h) [Reset = 00000000h]

ALE_LEN_ERROR_DROP is shown in [Table 9-325](#).

Return to the [Summary Table](#).

ALE Length Error Drop

Table 9-325. ALE_LEN_ERROR_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Length Error drop

9.6.294 ALE_IP_NEXT_HDR_DROP Register (Offset = 0003A0D8h) [Reset = 00000000h]

ALE_IP_NEXT_HDR_DROP is shown in [Table 9-326](#).

Return to the [Summary Table](#).

ALE IP Next Header Drop

Table 9-326. ALE_IP_NEXT_HDR_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Next Header drop

9.6.295 ALE_IPV4_FRAG_DROP Register (Offset = 0003A0DCh) [Reset = 0000000h]

ALE_IPV4_FRAG_DROP is shown in [Table 9-327](#).

Return to the [Summary Table](#).

ALE IPV4 Frag Drop

Table 9-327. ALE_IPV4_FRAG_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE IPV4 Fragment drop

9.6.296 TX_MEMORY_PROTECT_ERROR Register (Offset = 0003A17Ch) [Reset = X]

TX_MEMORY_PROTECT_ERROR is shown in [Table 9-328](#).

Return to the [Summary Table](#).

Transmit Memory Protect CRC Error

9.6.302 RXALIGNCODEERRORS Register (Offset = 0003A214h) [Reset = 0000000h]

RXALIGNCODEERRORS is shown in [Table 9-334](#).

Return to the [Summary Table](#).

Total number of alignment/code errors received

Table 9-334. RXALIGNCODEERRORS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of alignment/code errors received

9.6.303 RXOVERSIZEDFRAMES Register (Offset = 0003A218h) [Reset = 00000000h]

RXOVERSIZEDFRAMES is shown in [Table 9-286](#).

Return to the [Summary Table](#).

Total number of oversized frames received

Table 9-335. RXOVERSIZEDFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of oversized frames received

9.6.304 RXJABBERFRAMES Register (Offset = 0003A21Ch) [Reset = 0000000h]

RXJABBERFRAMES is shown in [Table 9-336](#).

Return to the [Summary Table](#).

Total number of jabber frames received

Table 9-336. RXJABBERFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of jabber frames received

9.6.305 RXUNDERSIZEDFRAMES Register (Offset = 0003A220h) [Reset = 00000000h]

RXUNDERSIZEDFRAMES is shown in [Table 9-287](#).

Return to the [Summary Table](#).

Total number of undersized frames received

Table 9-337. RXUNDERSIZEDFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of undersized frames received

9.6.306 RXFRAGMENTS Register (Offset = 0003A224h) [Reset = 00000000h]

RXFRAGMENTS is shown in [Table 9-288](#).

Return to the [Summary Table](#).

Total number of fragmented frames received

Table 9-338. RXFRAGMENTS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of fragmented frames received

9.6.307 ALE_DROP Register (Offset = 0003A228h) [Reset = 00000000h]

ALE_DROP is shown in [Table 9-289](#).

Return to the [Summary Table](#).

Total number of frames dropped by the ALE

Table 9-339. ALE_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames dropped by the ALE

9.6.308 ALE_OVERRUN_DROP Register (Offset = 0003A22Ch) [Reset = 0000000h]

ALE_OVERRUN_DROP is shown in [Table 9-290](#).

Return to the [Summary Table](#).

Total number of overrun frames dropped by the ALE

Table 9-340. ALE_OVERRUN_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of overrun frames dropped by the ALE

9.6.309 RXOCTETS Register (Offset = 0003A230h) [Reset = 00000000h]

RXOCTETS is shown in [Table 9-291](#).

Return to the [Summary Table](#).

Total number of received bytes in good frames

Table 9-341. RXOCTETS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of received bytes in good frames

9.6.310 TXGOODFRAMES Register (Offset = 0003A234h) [Reset = 00000000h]

TXGOODFRAMES is shown in [Table 9-292](#).

Return to the [Summary Table](#).

Total number of good frames transmitted

Table 9-342. TXGOODFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good frames transmitted

9.6.311 TXBROADCASTFRAMES Register (Offset = 0003A238h) [Reset = 0000000h]

TXBROADCASTFRAMES is shown in [Table 9-293](#).

Return to the [Summary Table](#).

Total number of good broadcast frames transmitted

Table 9-343. TXBROADCASTFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good broadcast frames transmitted

9.6.312 TXMULTICASTFRAMES Register (Offset = 0003A23Ch) [Reset = 00000000h]

TXMULTICASTFRAMES is shown in [Table 9-294](#).

Return to the [Summary Table](#).

Total number of good multicast frames transmitted

Table 9-344. TXMULTICASTFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of good multicast frames transmitted

9.6.313 TXPAUSEFRAMES Register (Offset = 0003A240h) [Reset = 0000000h]

TXPAUSEFRAMES is shown in [Table 9-345](#).

Return to the [Summary Table](#).

Total number of pause frames transmitted

Table 9-345. TXPAUSEFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of pause frames transmitted

9.6.314 TXDEFERREDFRAMES Register (Offset = 0003A244h) [Reset = 00000000h]

TXDEFERREDFRAMES is shown in [Table 9-346](#).

Return to the [Summary Table](#).

Total number of deferred frames transmitted

Table 9-346. TXDEFERREDFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of deferred frames transmitted

9.6.315 TXCOLLISIONFRAMES Register (Offset = 0003A248h) [Reset = 00000000h]

TXCOLLISIONFRAMES is shown in [Table 9-347](#).

Return to the [Summary Table](#).

Total number of transmitted frames experiencing a collision

Table 9-347. TXCOLLISIONFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of transmitted frames experiencing a collision

9.6.316 TXSINGLECOLLFRAMES Register (Offset = 0003A24Ch) [Reset = 0000000h]

TXSINGLECOLLFRAMES is shown in [Table 9-295](#).

Return to the [Summary Table](#).

Total number of transmitted frames experiencing a single collision

Table 9-348. TXSINGLECOLLFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of transmitted frames experiencing a single collision

9.6.317 TXMULTCOLLFRAMES Register (Offset = 0003A250h) [Reset = 00000000h]

TXMULTCOLLFRAMES is shown in [Table 9-296](#).

Return to the [Summary Table](#).

Total number of transmitted frames experiencing multiple collisions

Table 9-349. TXMULTCOLLFRAMES Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of transmitted frames experiencing multiple collisions

9.6.318 TXEXCESSIVECOLLISIONS Register (Offset = 0003A254h) [Reset = 0000000h]

TXEXCESSIVECOLLISIONS is shown in [Table 9-350](#).

Return to the [Summary Table](#).

Total number of transmitted frames abandoned due to excessive collisions

Table 9-350. TXEXCESSIVECOLLISIONS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of transmitted frames abandoned due to excessive collisions

9.6.319 TXLATECOLLISIONS Register (Offset = 0003A258h) [Reset = 00000000h]

TXLATECOLLISIONS is shown in [Table 9-351](#).

Return to the [Summary Table](#).

Total number of transmitted frames abandoned due to a late collision

Table 9-351. TXLATECOLLISIONS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of transmitted frames abandoned due to a late collision

9.6.320 RXIPGERROR Register (Offset = 0003A25Ch) [Reset = 0000000h]

RXIPGERROR is shown in [Table 9-352](#).

Return to the [Summary Table](#).

Total number of receive inter-packet gap errors (10G only)

Table 9-352. RXIPGERROR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of receive inter-packet gap errors (10G only)

9.6.321 TXCARRIERSENSEERRORS Register (Offset = 0003A260h) [Reset = 00000000h]

TXCARRIERSENSEERRORS is shown in [Table 9-353](#).

Return to the [Summary Table](#).

Total number of transmitted frames that experienced a carrier loss

Table 9-353. TXCARRIERSENSEERRORS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of transmitted frames that experienced a carrier loss

9.6.322 TXOCTETS Register (Offset = 0003A264h) [Reset = 00000000h]

TXOCTETS is shown in [Table 9-297](#).

Return to the [Summary Table](#).

Total number of bytes in all good frames transmitted

Table 9-354. TXOCTETS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of bytes in all good frames transmitted

9.6.323 OCTETFRAMES64 Register (Offset = 0003A268h) [Reset = 00000000h]

OCTETFRAMES64 is shown in [Table 9-298](#).

Return to the [Summary Table](#).

Total number of 64-byte frames received and transmitted

Table 9-355. OCTETFRAMES64 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of 64-byte frames received and transmitted

9.6.324 OCTETFRAMES65T127 Register (Offset = 0003A26Ch) [Reset = 00000000h]

OCTETFRAMES65T127 is shown in [Table 9-299](#).

Return to the [Summary Table](#).

Total number of frames of size 65 to 127 bytes received and transmitted

Table 9-356. OCTETFRAMES65T127 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 65 to 127 bytes received and transmitted

9.6.325 OCTETFRAMES128T255 Register (Offset = 0003A270h) [Reset = 00000000h]

OCTETFRAMES128T255 is shown in [Table 9-300](#).

Return to the [Summary Table](#).

Total number of frames of size 128 to 255 bytes received and transmitted

Table 9-357. OCTETFRAMES128T255 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 128 to 255 bytes received and transmitted

9.6.326 OCTETFRAMES256T511 Register (Offset = 0003A274h) [Reset = 00000000h]

OCTETFRAMES256T511 is shown in [Table 9-301](#).

Return to the [Summary Table](#).

Total number of frames of size 256 to 511 bytes received and transmitted

Table 9-358. OCTETFRAMES256T511 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 256 to 511 bytes received and transmitted

9.6.327 OCTETFRAMES512T1023 Register (Offset = 0003A278h) [Reset = 00000000h]

OCTETFRAMES512T1023 is shown in [Table 9-302](#).

Return to the [Summary Table](#).

Total number of frames of size 512 to 1023 bytes received and transmitted

Table 9-359. OCTETFRAMES512T1023 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 512 to 1023 bytes received and transmitted

9.6.328 OCTETFRAMES1024TUP Register (Offset = 0003A27Ch) [Reset = 00000000h]

OCTETFRAMES1024TUP is shown in [Table 9-303](#).

Return to the [Summary Table](#).

Total number of frames of size 1024 to rx_maxlen bytes received and 1024 bytes or greater transmitted

Table 9-360. OCTETFRAMES1024TUP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of frames of size 1024 to rx_maxlen bytes received and 1024 bytes or greater transmitted

9.6.329 NETOCTETS Register (Offset = 0003A280h) [Reset = 00000000h]

NETOCTETS is shown in [Table 9-304](#).

Return to the [Summary Table](#).

Total number of bytes received and transmitted

Table 9-361. NETOCTETS Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of bytes received and transmitted

9.6.330 RX_BOTTOM_OF_FIFO_DROP Register (Offset = 0003A284h) [Reset = 00000000h]

RX_BOTTOM_OF_FIFO_DROP is shown in [Table 9-305](#).

Return to the [Summary Table](#).

Receive Bottom of FIFO Drop

Table 9-362. RX_BOTTOM_OF_FIFO_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Receive Bottom of FIFO Drop

9.6.331 PORTMASK_DROP Register (Offset = 0003A288h) [Reset = 00000000h]

PORTMASK_DROP is shown in [Table 9-306](#).

Return to the [Summary Table](#).

Total number of dropped frames received due to portmask

Table 9-363. PORTMASK_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames received due to portmask

9.6.332 RX_TOP_OF_FIFO_DROP Register (Offset = 0003A28Ch) [Reset = 00000000h]

RX_TOP_OF_FIFO_DROP is shown in [Table 9-307](#).

Return to the [Summary Table](#).

Receive Top of FIFO Drop

Table 9-364. RX_TOP_OF_FIFO_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Receive Top of FIFO Drop

9.6.333 ALE_RATE_LIMIT_DROP Register (Offset = 0003A290h) [Reset = 00000000h]

ALE_RATE_LIMIT_DROP is shown in [Table 9-308](#).

Return to the [Summary Table](#).

Total number of dropped frames due to ALE Rate Limiting

Table 9-365. ALE_RATE_LIMIT_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE Rate Limiting

9.6.334 ALE_VID_INGRESS_DROP Register (Offset = 0003A294h) [Reset = 00000000h]

ALE_VID_INGRESS_DROP is shown in [Table 9-309](#).

Return to the [Summary Table](#).

Total number of dropped frames due to ALE VID Ingress

Table 9-366. ALE_VID_INGRESS_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE VID Ingress

9.6.335 ALE_DA_EQ_SA_DROP Register (Offset = 0003A298h) [Reset = 00000000h]

ALE_DA_EQ_SA_DROP is shown in [Table 9-310](#).

Return to the [Summary Table](#).

Total number of dropped frames due to DA=SA

Table 9-367. ALE_DA_EQ_SA_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to DA=SA

9.6.336 ALE_BLOCK_DROP Register (Offset = 0003A29Ch) [Reset = 00000000h]

ALE_BLOCK_DROP is shown in [Table 9-311](#).

Return to the [Summary Table](#).

Total number of dropped frames due to ALE Block Mode

Table 9-368. ALE_BLOCK_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE Block Mode

9.6.337 ALE_SECURE_DROP Register (Offset = 0003A2A0h) [Reset = 00000000h]

ALE_SECURE_DROP is shown in [Table 9-312](#).

Return to the [Summary Table](#).

Total number of dropped frames due to ALE Secure Mode

Table 9-369. ALE_SECURE_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE Secure Mode

9.6.338 ALE_AUTH_DROP Register (Offset = 0003A2A4h) [Reset = 00000000h]

ALE_AUTH_DROP is shown in [Table 9-313](#).

Return to the [Summary Table](#).

Total number of dropped frames due to ALE Authentication

Table 9-370. ALE_AUTH_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	Total number of dropped frames due to ALE Authentication

9.6.339 ALE_UNKN_UNI Register (Offset = 0003A2A8h) [Reset = 00000000h]

ALE_UNKN_UNI is shown in [Table 9-314](#).

Return to the [Summary Table](#).

ALE Receive Unknown Unicast

Table 9-371. ALE_UNKN_UNI Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Unicast

9.6.340 ALE_UNKN_UNI_BCNT Register (Offset = 0003A2ACh) [Reset = 00000000h]

ALE_UNKN_UNI_BCNT is shown in [Table 9-315](#).

Return to the [Summary Table](#).

ALE Receive Unknown Unicast Bytecount

Table 9-372. ALE_UNKN_UNI_BCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Unicast Bytecount

9.6.341 ALE_UNKN_MLT Register (Offset = 0003A2B0h) [Reset = 00000000h]

ALE_UNKN_MLT is shown in [Table 9-316](#).

Return to the [Summary Table](#).

ALE Receive Unknown Multicast

Table 9-373. ALE_UNKN_MLT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Multicast

9.6.342 ALE_UNKN_MLT_BCNT Register (Offset = 0003A2B4h) [Reset = 00000000h]

ALE_UNKN_MLT_BCNT is shown in [Table 9-317](#).

Return to the [Summary Table](#).

ALE Receive Unknown Multicast Bytecount

Table 9-374. ALE_UNKN_MLT_BCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Multicast Bytecount

9.6.343 ALE_UNKN_BRD Register (Offset = 0003A2B8h) [Reset = 00000000h]

ALE_UNKN_BRD is shown in [Table 9-318](#).

Return to the [Summary Table](#).

ALE Receive Unknown Broadcast

Table 9-375. ALE_UNKN_BRD Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Broadcast

9.6.344 ALE_UNKN_BRD_BCNT Register (Offset = 0003A2BCh) [Reset = 0000000h]

ALE_UNKN_BRD_BCNT is shown in [Table 9-319](#).

Return to the [Summary Table](#).

ALE Receive Unknown Broadcast Bytecount

Table 9-376. ALE_UNKN_BRD_BCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Receive Unknown Broadcast Bytecount

9.6.345 ALE_POL_MATCH Register (Offset = 0003A2C0h) [Reset = 0000000h]

ALE_POL_MATCH is shown in [Table 9-320](#).

Return to the [Summary Table](#).

ALE Policer Matched

Table 9-377. ALE_POL_MATCH Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Policer Matched

9.6.346 ALE_POL_MATCH_RED Register (Offset = 0003A2C4h) [Reset = 00000000h]

ALE_POL_MATCH_RED is shown in [Table 9-321](#).

Return to the [Summary Table](#).

ALE Policer Matched and Condition Red

Table 9-378. ALE_POL_MATCH_RED Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Policer Matched and Condition Red

9.6.347 ALE_POL_MATCH_YELLOW Register (Offset = 0003A2C8h) [Reset = 00000000h]

ALE_POL_MATCH_YELLOW is shown in [Table 9-322](#).

Return to the [Summary Table](#).

ALE Policer Matched and Condition Yellow

Table 9-379. ALE_POL_MATCH_YELLOW Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Policer Matched and Condition Yellow

9.6.348 ALE_MULT_SA_DROP Register (Offset = 0003A2CCh) [Reset = 0000000h]

ALE_MULT_SA_DROP is shown in [Table 9-323](#).

Return to the [Summary Table](#).

ALE Multicast Source Address Drop

Table 9-380. ALE_MULT_SA_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	COUNT	R/W	0h	ALE Multicast Source Address drop

9.6.349 ALE_DUAL_VLAN_DROP Register (Offset = 0003A2D0h) [Reset = 0000000h]

ALE_DUAL_VLAN_DROP is shown in [Table 9-324](#).

Return to the [Summary Table](#).

ALE Dual VLAN Drop

Table 9-381. ALE_DUAL_VLAN_DROP Register Field Descriptions

Bit	Field	Type	Reset	Description

9.6.357 ENET_PN_TX_PRI_DROP_BCNT_REG_y Register (Offset = 0003A3E0h + formula) [Reset = 00000000h]

ENET_PN_TX_PRI_DROP_BCNT_REG_y is shown in [Table 9-389](#).

Return to the [Summary Table](#).

ENET Port n PRIORITY N Packet Drop Byte Count

Offset = 0003A3E0h + (y * 4h); where y = 0h to 7h

Table 9-389. ENET_PN_TX_PRI_DROP_BCNT_REG_y Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	PN_TX_PRIN_DROP_BCNT	R/W	0h	ENET Port n PRIORITY N Packet Drop Byte Count

9.6.358 IDVER_REG Register (Offset = 0003D000h) [Reset = 4E8A010Bh]

IDVER_REG is shown in [Table 9-390](#).

Return to the [Summary Table](#).

Identification and Version Register

Table 9-390. IDVER_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	TX_IDENT	R	4E8Ah	Identification value
15-11	RTL_VER	R	0h	RTL version value
10-8	MAJOR_VER	R	1h	Major version value
7-0	MINOR_VER	R	Bh	Minor version value

9.6.359 CONTROL_REG Register (Offset = 0003D004h) [Reset = X]

CONTROL_REG is shown in [Table 9-51](#).

Return to the [Summary Table](#).

Time Sync Control Register

Table 9-391. CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-28	TS_SYNC_SEL	R/W	0h	TS_SYNC output timestamp counter bit select
27-18	RESERVED	R/W	X	
17	TS_GENF_CLR_EN	R/W	0h	Enable for GENF clear when length is zero
16	TS_RX_NO_EVENT	R/W	0h	Receive Produces no Events
15	HW8_TS_PUSH_EN	R/W	0h	Hardware push 8 enable
14	HW7_TS_PUSH_EN	R/W	0h	Hardware push 7 enable
13	HW6_TS_PUSH_EN	R/W	0h	Hardware push 6 enable
12	HW5_TS_PUSH_EN	R/W	0h	Hardware push 5 enable
11	HW4_TS_PUSH_EN	R/W	0h	Hardware push 4 enable
10	HW3_TS_PUSH_EN	R/W	0h	Hardware push 3 enable
9	HW2_TS_PUSH_EN	R/W	0h	Hardware push 2 enable
8	HW1_TS_PUSH_EN	R/W	0h	Hardware push 1 enable
7	TS_PPM_DIR	R/W	0h	Timestamp PPM Direction
6	TS_COMP_TOG	R/W	0h	Timestamp Compare Toggle mode: 0=TS_COMP is in non-toggle mode, 1=TS_COMP is in toggle mode
5	MODE	R/W	0h	Timestamp mode
4	SEQUENCE_EN	R/W	0h	Sequence Enable
3	TSTAMP_EN	R/W	0h	Host Receive Timestamp Enable
2	TS_COMP_POLARITY	R/W	1h	TS_COMP polarity
1	INT_TEST	R/W	0h	Interrupt test
0	CPTS_EN	R/W	0h	Time sync enable

9.6.360 RFTCLK_SEL_REG Register (Offset = 0003D008h) [Reset = X]

9.6.395 MOD_VER Register (Offset = 0003E000h) [Reset = 00294104h]

MOD_VER is shown in [Table 9-427](#).

Return to the [Summary Table](#).

The Module and Version Register identifies the module identifier and revision of the ALE_2g32 module.

Table 9-427. MOD_VER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	MODULE_ID	R	29h	ALE_2g32 module ID.
15-11	RTL_VERSION	R	8h	RTL Version.
10-8	MAJOR_REVISION	R	1h	Major Revision.
7-6	CUSTOM_REVISION	R	0h	Custom Revision.
5-0	MINOR_REVISION	R	4h	Minor Revision.

9.6.396 ALE_STATUS Register (Offset = 0003E004h) [Reset = X]

ALE_STATUS is shown in [Table 9-428](#).

Return to the [Summary Table](#).

The ALE status provides information on the ALE configuration and state. The ~iramdepth is used to determine how IPv6 entries are stored in the table. IPv6 entries are stored in two entries where IPv6 Entry hi is designated by the odd slice index and lo is designated by the even slice index. The slice index is above the ram depth like {SlixelIndex,RamIndex}. So for a 64 deep RAM index of 0x005, the Hi portion of the IPv6 entry is located at 0x005|0x040 and the Lo portion is located at 0x005&(~0x040).

Table 9-428. ALE_STATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31	UREGANDREGMSK12	R	0h	When set, the unregistered multicast field is a mask versus an index on 12 bit boundary in the ALE table.
30	UREGANDREGMSK08	R	0h	When set, the unregistered multicast field is a mask versus an index on 8 bit boundary in the ALE table.
29-16	RESERVED	R	X	
15-8	POLCNTDIV8	R	0h	This is the number of policer engines the ALE implements divided by 8. A value of 4 indicates 32 policer engines total.
7	RAMDEPTH128	R	0h	The number of ALE entries per slice of the table when this is set it indicates the depth is 128 if both ramdepth128 and ramdepth32 are zero the depth is 64.
6	RAMDEPTH32	R	0h	The number of ALE entries per slice of the table when this is set it indicates the depth is 32 if both ramdepth128 and ramdepth32 are zero the depth is 64.
5	RESERVED	R	X	
4-0	KLUENTRIES	R	0h	This is the number of table entries total divided by 1024. A value of 1 indicates 1024 table entries. A value of 8 indicates 8192 table entries.

9.6.397 ALE_CONTROL Register (Offset = 0003E008h) [Reset = X]

ALE_CONTROL is shown in [Table 9-429](#).

Return to the [Summary Table](#).

The ALE Control Register is used to set the ALE modes used for all ports.

Table 9-429. ALE_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ENABLE_ALE	R/W	0h	Enable ALE 0 - Drop all packets 1 - Enable ALE packet processing
30	CLEAR_TABLE	R/W	0h	Clear ALE address table - Setting this bit causes the ALE hardware to write all table bit values to zero. Software must perform a clear table operation as part of the ALE setup/configuration process. Setting this bit causes all ALE accesses to be held up for 64 clocks while the clear is performed. Access to all ALE registers will be blocked (wait states) until the 64 clocks have completed. This bit cannot be read as one because the read is blocked until the clear table is completed at which time this bit is cleared to zero.
29	AGE_OUT_NOW	R/W	0h	Age Out Address Table Now - Setting this bit causes the ALE hardware to remove (free up) any ageable table entry that does not have a set touch bit. This bit is cleared when the age out process has completed. This bit may be read. The age out process takes four times the number of table entries clock cycles (4096 cycles for 1K addresses) best case (no ale packet processing during ageout) and sixty five times the number of table entries clock cycles (66560 cycles for 1K addresses) absolute worst case.
28-25	RESERVED	R/W	X	
24	MIRROR_DP	R/W	0h	Mirror Destination Port - This field defines the port to which destination traffic destined will be duplicated. That is all traffic that is forwarded to this port will also be mirrored to the ~imirror_top port.
23-21	UPD_BW_CTRL	R/W	0h	The ~iupd_bw_ctrl field allows for up to 8 times the rate in which adds, updates, touches, writes, and aging updates can occur. At frequencies of 350Mhz, the table update rate should be at it lowest or 5 Million updates per second. When operating the switch core at frequencies or above, the ~iupd_bw_ctrl can be programmed more aggressive. If the ~iupd_bw_ctrl is set but the frequency of the switch subsystem is below the associated value, ALE will drop packets due to insufficient time to complete lookup under high traffic loads. 0 - 350Mhz, 5M 1 - 359Mhz, 11M 2 - 367Mhz, 16M 3 - 375Mhz, 22M 4 - 384Mhz, 28M 5 - 392Mhz, 34M 6 - 400Mhz, 39M 7 - 409Mhz, 45M
20-17	RESERVED	R/W	X	
16	MIRROR_TOP	R/W	0h	Mirror To Port - This field defines the destination port for the mirror traffic. If the traffic is received or transmitted on the mirror destination port it will not be duplicated. Traffic defined as mirror traffic only may be dropped by the switch due to congestion.
15	UPD_STATIC	R/W	0h	Update Static Entries - A static Entry is an entry that is not agable. When clear this bit will prevent any static entry (agable bit clear) from being updated due to port change. When set it allows static entries (agable bit clear) to update the source port if required. This bit should normally be '0' for most switch configurations.
14	RESERVED	R/W	X	
13	UVLAN_NO_LEARN	R/W	0h	Unknown VLAN No Learn - This field when set will prevent source addresses of unknown VLAN IDs from being automatically added into the look up table if learning is enabled.

Table 9-429. ALE_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	MIRROR_MEN	R/W	0h	Mirror Match Entry Enable - This field enables the match mirror option. When this bit is set any traffic whose destination, source, VLAN or OUI matches the ~imirror_midx entry index will have that traffic also sent to the ~imirror_top port.
11	MIRROR_DEN	R/W	0h	Mirror Destination Port Enable - This field enables the destination port mirror option. When this bit is set any traffic destined for the ~imirror_dp port will have its transmit traffic also sent to the ~imirror_top port.
10	MIRROR_SEN	R/W	0h	Mirror Source Port Enable - This field enables the source port mirror option. When this bit is set any port with the ~ipX_mirror_sp set in the ALE Port Control registers set will have its received traffic also sent to the ~imirror_top port.
9	RESERVED	R/W	X	
8	EN_HOST_UNI_FLOOD	R/W	0h	Unknown unicast packets flood to host 0 - unknown unicast packets are not sent to the host 1 - unknown unicast packets flood to host port as well as other ports
7	LEARN_NO_VLANID	R/W	0h	Learn No VID - 0 - VID is learned with the source address 1 - VID is not learned with the source address (source address is not tied to VID). Determines the entry type.
6	ENABLE_VID0_MODE	R/W	0h	Enable VLAN ID = 0 Mode 0 - Process the priority tagged packet with VID = PORT_VLAN[11:0]. 1 - Process the priority tagged packet with VID = 0.
5	ENABLE_OUI_DENY	R/W	0h	Enable OUI Deny Mode - When set, any packet with a non-matching OUI source address will be dropped to the host unless the packet destination address matches a supervisory destination address table entry. When cleared, any packet source address matching an OUI address table entry will be dropped to the host unless the destination address matches with a supervisory destination address table entry.
4	ENABLE_BYPASS	R/W	0h	ALE Bypass - When set, packets received on non-host ports are sent to the host. It is expected that packets from the host are directed to the particular port. 0 - no bypass 1 - bypass the ALE
3	BCAST_MCAST_CTL	R/W	0h	Rate Limit Transmit mode 0 - Broadcast and multicast rate limit counters are received port based 1 - Broadcast and multicast rate limit counters are transmit port based
2	ALE_VLAN_AWARE	R/W	0h	ALE VLAN Aware - Determines how traffic is forwarded using VLAN rules. 0 - Simple switch rules, packets forwarded to all ports for unknown destinations. 1 - VLAN Aware rules, packets forwarded based on VLAN members
1	ENABLE_AUTH_MODE	R/W	0h	Enable MAC Authorization Mode - Mac authorization mode requires that all table entries be made by the host software. There is no auto learning of addresses in authorization mode and the packet will be dropped if the source address is not found (and the destination address is not a multicast address with the super table entry bit set). 0 - The ALE is not in MAC authorization mode 1 - The ALE is in MAC authorization mode
0	ENABLE_RATE_LIMIT	R/W	0h	Enable Broadcast and Multicast Rate Limit 0 - Broadcast/Multicast rates not limited 1 - Broadcast/Multicast packet reception limited to the port control register rate limit fields.

9.6.398 ALE_CTRL2 Register (Offset = 0003E00Ch) [Reset = X]

ALE_CTRL2 is shown in [Table 9-430](#).

Return to the [Summary Table](#).

The ALE Control 2 Register is used to set the extended features used for all ports.

Table 9-430. ALE_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	TRK_EN_DST	R/W	0h	Trunk Enable Destination Address - This field enables the destination MAC address to be used with the hash function $G(X) = 1 + X + X^3$ and affect the trunk port transmit link determination.
30	TRK_EN_SRC	R/W	0h	Trunk Enable Source Address - This field enables the source MAC address to be used with the hash function $G(X) = 1 + X + X^3$ and affect the trunk port transmit link determination.
29	TRK_EN_PRI	R/W	0h	Trunk Enable Priority - This field enables the VLAN Priority bits to be used with the hash function $G(X) = 1 + X + X^3$ and affect the trunk port transmit link determination. In the event that DSCP mapping is enabled and there is no VLAN the DSCP priority will be used. For all other non IP frames without VLAN the port default priority is used.
28	RESERVED	R/W	X	
27	TRK_EN_IVLAN	R/W	0h	Trunk Enable Inner VLAN - This field enables the inner VLAN ID value (C-VLANID) to be used with the hash function $G(X) = 1 + X + X^3$ and affect the trunk port transmit link determination.
26	RESERVED	R/W	X	
25	TRK_EN_SIP	R/W	0h	Trunk Enable Source IP Address - This field enables the source IP address to be used with the hash function $G(X) = 1 + X + X^3$ and affect the trunk port transmit link determination. This feature supports No tag, Priority tagged, VLAN tagged, Q-in-Q double tagging for both IPV6 and IPV4.
24	TRK_EN_DIP	R/W	0h	Trunk Enable Destination IP Address - This field enables the destination IP address to be used with the hash function $G(X) = 1 + X + X^3$ and affect the trunk port transmit link determination. This feature supports No tag, Priority tagged, VLAN tagged, Q-in-Q double tagging for both IPV6 and IPV4.
23	DROP_BADLEN	R/W	0h	Drop Bad Length will drop any packet that the 802.3 length field is larger than the packet. Ethertypes 0-1500 are 802.3 lengths, all others are Ether types.
22	NODROP_SRCMCST	R/W	0h	No Drop Source Multicast will disable the dropping of any source address with the multicast bit set.
21	DEFNOFRAG	R/W	0h	Default No Frag field will cause an IPv4 fragmented packet to be dropped if a VLAN entry is not found.
20	DEFLMTNXTHDR	R/W	0h	Default limit next header field will cause an IPv4 protocol or IPv6 next header packet to be dropped if a VLAN entry is not found and the protocol or next header does not match the ~iALE_NXT_HDR register values.
19	RESERVED	R/W	X	

Table 9-430. ALE_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18-16	TRK_BASE	R/W	0h	<p>Trunk Base - This field is the hash formula starting value. Changing this value will cause the packet distribution on trunk ports to be changed. If all the <code>~itrk_en_dst</code>, <code>~itrk_en_src</code>, <code>~itrk_en_pri</code> and <code>~itrk_en_vlan</code> are '0', this value is used as the distribution index. That is a '0' will select the 1st bit of an 'N' link trunk, a '1' will select the second, etc.</p> <p>Below is the distribution across the trunk links. The first number in the <code>~iitalic</code> sequence indicates the traffic is sent to the lowest numbered port of a trunk group. For example if you have a 3 port trunk, the hash result 0 will go to the base port (0), hash result 1 will go to the highest port of the trunk group (2), hash result 2 will go to the middle port (1), etc.</p> <p>1 - <code>~i00000000</code> 2 - <code>~i01010101</code> 3 - <code>~i02102102</code> 4 - <code>~i03210321</code></p>
15-5	RESERVED	R/W	X	
4-0	MIRROR_MIDX	R/W	0h	<p>Mirror Index - This field is the ALE lookup table entry index that when a match occurs will cause this traffic to be mirrored to the <code>~imirror_top</code> port. That is any VLAN, ONU or address with or without VLAN can be selected for traffic mirroring.</p>

9.6.399 ALE_PRESCALE Register (Offset = 0003E010h) [Reset = X]

ALE_PRESCALE is shown in [Table 9-431](#).

Return to the [Summary Table](#).

The ALE Prescale Register is used to set the Broadcast and Multicast rate limiting prescaler value.

Table 9-431. ALE_PRESCALE Register Field Descriptions

Bit	Field	Type	Reset	Description
31-20	RESERVED	R/W	X	
19-0	ALE_PRESCALE	R/W	0h	ALE Prescale - The input clock is divided by this value for use in the multicast/broadcast rate limiters. The minimum operating value is 0x10. The prescaler is off when the value is zero.

9.6.400 ALE_AGING_CTRL Register (Offset = 0003E014h) [Reset = X]

ALE_AGING_CTRL is shown in [Table 9-432](#).

Return to the [Summary Table](#).

The ALE Aging Control sets the aging interval which will cause periodic aging to occur. This value specifies the minimum time between aging starts.

Table 9-432. ALE_AGING_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PRESCALE_2_DISABLE	R/W	0h	ALE Prescaler 2 Disable - When set will divide the aging interval by 1000. This bit is designed for device verification and should not be used in production software. Combination of PreScale1Disable and PreScale2Disable will divide the aging interval by 1,000,000 for test purposes.
30	PRESCALE_1_DISABLE	R/W	0h	ALE Prescaler 1 Disable - When set will divide the aging interval by 1000. This bit is designed for device verification and should not be used in production software. Combination of PreScale1Disable and PreScale2Disable will divide the aging interval by 1,000,000 for test purposes.
29-24	RESERVED	R/W	X	
23-0	ALE_AGING_TIMER	R/W	0h	ALE Aging Timer - This field specifies the number of clock cycles times 1,000,000 between aging operations.

9.6.401 ALE_NXT_HDR Register (Offset = 0003E01Ch) [Reset = 00000000h]

ALE_NXT_HDR is shown in [Table 9-433](#).

Return to the [Summary Table](#).

The ALE Next Header is used to limit the IPv6 Next header or IPv4 Protocol values found in the IP header. It is enabled via the ~iLmtNxtHdr bit in the VLAN entry. All four ~iip_nxt_hdr0-3 are compared when enabled, so if only one is required, set them all to the one value to be tested.

Table 9-433. ALE_NXT_HDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	IP_NXT_HDR3	R/W	0h	The ~iip_nxt_hdr3 is the forth protocol or next header compared when enabled.
23-16	IP_NXT_HDR2	R/W	0h	The ~iip_nxt_hdr2 is the third protocol or next header compared when enabled.
15-8	IP_NXT_HDR1	R/W	0h	The ~iip_nxt_hdr1 is the second protocol or next header compared when enabled.
7-0	IP_NXT_HDR0	R/W	0h	The ~iip_nxt_hdr0 is the first protocol or next header compared when enabled.

9.6.402 ALE_TBLCTL Register (Offset = 0003E020h) [Reset = X]

ALE_TBLCTL is shown in [Table 9-434](#).

Return to the [Summary Table](#).

The ALE table control register is used to read or write that ALE table entries. After writing to this register any read or write to any ALE register will be stalled until the read or write operation completes.

Table 9-434. ALE_TBLCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	TABLEWR	R/W	0h	Table Write - This bit is used to write the table words to the lookup table. 0 - Table Read Operation is performed. The contents of the ~b TABLEIDX entry will be read into the ~b ALE_TBLWx registers 1 - Table write operation is performed. This will take the current contents from the ~b ALE_TBLWx registers and write them to the table at the specified ~b TABLEIDX.
30-5	RESERVED	R/W	X	
4-0	TABLEIDX	R/W	0h	The table index is used to determine which lookup table entry is read or written.

9.6.403 ALE_TBLW2 Register (Offset = 0003E034h) [Reset = X]

ALE_TBLW2 is shown in [Table 9-435](#).

Return to the [Summary Table](#).

The ALE Table Word 2 is the most significant word of an ALE table entry.

Table 9-435. ALE_TBLW2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-7	RESERVED	R/W	X	
6-0	TABLEWRD2	R/W	0h	Table Entry bits [71:64]

9.6.404 ALE_TBLW1 Register (Offset = 0003E038h) [Reset = 00000000h]

ALE_TBLW1 is shown in [Table 9-436](#).

Return to the [Summary Table](#).

The ALE Table Word 1 is the middle word of an ALE table entry.

Table 9-436. ALE_TBLW1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TABLEWRD1	R/W	0h	Table Entry bits [63:32]

9.6.405 ALE_TBLW0 Register (Offset = 0003E03Ch) [Reset = 00000000h]

ALE_TBLW0 is shown in [Table 9-437](#).

Return to the [Summary Table](#).

The ALE Table Word 0 is the least significant word of an ALE table entry.

Table 9-437. ALE_TBLW0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	TABLEWRD0	R/W	0h	Table Entry bits [31:0]

9.6.406 IO_ALE_PORTCTL0_y Register (Offset = 0003E040h + formula) [Reset = X]

IO_ALE_PORTCTL0_y is shown in [Table 9-438](#).

Return to the [Summary Table](#).

The ALE Port Control Register sets the port specific modes of operation.

Offset = 0003E040h + (y * 4h); where y = 0h to 1h

Table 9-438. IO_ALE_PORTCTL0_y Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	IO_REG_P0_BCAST_LIMIT	R/W	0h	Broadcast Packet Rate Limit - Each prescale pulse loads this field into the port broadcast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Broadcast rate limiting is enabled by a non-zero value in this field.
23-16	IO_REG_P0_MCAST_LIMIT	R/W	0h	Multicast Packet Rate Limit - Each prescale pulse loads this field into the port multicast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Multicast rate limiting is enabled by a non-zero value in this field. The ~imcast_limit is the number of Multicast packets that will be forwarded per ~iale_prescale time.
15	IO_REG_P0_DROP_DOUBLE_VLAN	R/W	0h	Drop Double VLAN - When set cause any received packet with double VLANs to be dropped. That is if there are two ctag or two stag fields in the packet it will be dropped.
14	IO_REG_P0_DROP_DUAL_VLAN	R/W	0h	Drop Dual VLAN - When set will cause any received packet with dual VLAN stag followed by ctag to be dropped.
13	IO_REG_P0_MACONLY_CAF	R/W	0h	Mac Only Copy All Frames - When set a Mac Only port will transfer all received good frames to the host. When clear a Mac Only port will transfer packets to the host based on ALE destination address lookup operation (which operates more like an Ethernet Mac). A Mac Only port is a port with ~imaconly set.
12	IO_REG_P0_DISABLE_PAUTHMOD	R/W	0h	Disable Port authorization - When set will allow unknown addresses to arrive on a switch in authorization mode. It is intended for device to device network connection on ports which do not require MACSEC encryption.
11	IO_REG_P0_MACONLY	R/W	0h	MAC Only - When set enables this port be treated like a MAC port for the host. All traffic received is only sent to the host. The host must direct traffic to this port as the lookup engine will not send traffic to the ports with the ~ip0_maconly bit set and the ~ip0_no_learn also set. If ~ip0_maconly bit is set and the ~ip0_no_learn is not set, the host can send non-directed packets that can be sent to the destination of a MacOnly port. It is also possible that The host can broadcast to all ports including MacOnly ports in this mode.
10	IO_REG_P0_TRUNKEN	R/W	0h	Trunk Enable - This field is used to enable a port into a trunk. Any port can be used as a trunk port, any two or more ports with the ~ip0_trunken its set and having the same ~ip0_trunknum will be placed in the same trunk. There is no requirement for trunk ports to be adjacent. If all ports are enabled in the same trunk, no traffic can flow as traffic received within a trunk is never trasnmitted out the same trunk. If only a single port is a member of a trunk, it looks like a normal port with exception of entries in the look up table will be noted as a trunk entry.
9-8	IO_REG_P0_TRUNKNUM	R/W	0h	Trunk Number - This field is used as the trunk number when the ~ip0_trunken is also set. Ports with the same trunk number that have the ~ip0_trunken also set will have traffic distributed within the trunk based on the result of the hash function described above.

Table 9-438. I0_ALE_PORTCTL0_y Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	I0_REG_P0_MIRROR_SP	R/W	0h	Mirror Source Port - This field enables the source port mirror option. When this bit is set any traffic received on the port with the reg_p0_mirror_sp bit set will have its received traffic also sent to the ~imirror_top port.
6	RESERVED	R/W	X	
5	I0_REG_P0_NO_SA_UPDATE	R/W	0h	No Source Address Update - When set will not update the source addresses for this port.
4	I0_REG_P0_NO_LEARN	R/W	0h	No Learn - When set will not learn the source addresses for this port.
3	I0_REG_P0_VID_INGRESS_CHECK	R/W	0h	VLAN Ingress Check - When set if a packet received is not a member of the VLAN, the packet will be dropped.
2	I0_REG_P0_DROP_UNTAGGED	R/W	0h	If Drop Untagged - When set will drop packets without a VLAN tag.
1-0	I0_REG_P0_PORTSTATE	R/W	0h	Port State - Defines the current port state used for lookup operations. 0 - Disabled 1 - Blocked 2 - Learning 3 - Forwarding

9.6.407 ALE_UVLAN_MEMBER Register (Offset = 0003E090h) [Reset = X]

ALE_UVLAN_MEMBER is shown in [Table 9-439](#).

Return to the [Summary Table](#).

The ALE Unknown VLAN Member Mask Register is used to specify the member list for unknown VLAN ID.

Table 9-439. ALE_UVLAN_MEMBER Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	X	
1-0	UVLAN_MEMBER_LIST	R/W	0h	Unknown VLAN Member List - Each bit represents the port member status for unknown VLANs.

9.6.408 ALE_UVLAN_URCAST Register (Offset = 0003E094h) [Reset = X]

ALE_UVLAN_URCAST is shown in [Table 9-440](#).

Return to the [Summary Table](#).

The ALE Unknown VLAN Unregistered Multicast Flood Mask Register is used to specify which egress ports unregistered multicast addresses egress for the unregistered VLAN ID.

Table 9-440. ALE_UVLAN_URCAST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	X	
1-0	UVLAN_UNREG_MCAST_FLOOD_MASK	R/W	0h	Unknown VLAN Unregister Multicast Flood Mask - Each bit represents the port to which unregistered multicast are sent for unregistered VLANs.

9.6.409 ALE_UVLAN_RMCAST Register (Offset = 0003E098h) [Reset = X]

ALE_UVLAN_RMCAST is shown in [Table 9-441](#).

Return to the [Summary Table](#).

The ALE Unknown VLAN Registered Multicast Flood Mask Register is used to specify which egress ports registered multicast addresses egress for the unregistered VLAN ID.

Table 9-441. ALE_UVLAN_RMCAST Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	X	
1-0	UVLAN_REG_MCAST_FL OOD_MASK	R/W	0h	Unknown VLAN Register Multicast Flood Mask - Each bit represents the port to which registered multicast are sent for unregistered VLANs. This field is ANDed with the registered multicast mask to determine the destinations for unregistered VLANs.

9.6.410 ALE_UVLAN_UNTAG Register (Offset = 0003E09Ch) [Reset = X]

ALE_UVLAN_UNTAG is shown in [Table 9-442](#).

Return to the [Summary Table](#).

The ALE Unknown VLAN force Untagged Egress Mask Register is used to specify which egress ports the VLAN ID will be removed.

Table 9-442. ALE_UVLAN_UNTAG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	X	
1-0	UVLAN_FORCE_UNTAG GED_EGRESS	R/W	0h	Unknown VLAN Force Untagged Egress Mask - Each bit represents the port where the VLAN will be removed for unregistered VLANs.

9.6.411 ALE_STAT_DIAG Register (Offset = 0003E0B8h) [Reset = X]

ALE_STAT_DIAG is shown in [Table 9-443](#).

Return to the [Summary Table](#).

The ALE Statistic Output Diagnostic Register allows the output statistics to diagnose the SW counters. This register is for diagnostic only.

Table 9-443. ALE_STAT_DIAG Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R/W	X	
15	PBCAST_DIAG	R/W	0h	When set and the ~ipport_diag is set to zero, will allow all ports to see the same stat diagnostic increment.
14-9	RESERVED	R/W	X	
8	PORT_DIAG	R/W	0h	The port selected that a received packet will cause the selected error to increment
7-4	RESERVED	R/W	X	
3-0	STAT_DIAG	R/W	0h	When non-zero will cause the selected statistic to increment on the next frame received. For the selected Port. 0: Disabled 1: Destination Equal Source Drop Stat will count 2: VLAN Ingress Check Drop Stat will count 3: Source Multicast Drop Stat will count 4: Dual VLAN Drop Stat will count 5: Ether Type length error Drop Stat will count 6: Next Hop Limit Drop Stat will count 7: IPv4 Fragment Drop Stat will count 8: Classifier Hit Stat will count 9: Classifier Red Drop Stat will count 10: Classifier Yellow Drop Stat will count 11: ALE Overflow Drop Stat will count 12: Rate Limit Drop Stat will count 13: Blocked Address Drop Stat will count 14: Secure Address Drop Stat will count 15: Authorization Drop Stat will count

9.6.412 ALE_OAM_LB_CTRL Register (Offset = 0003E0BCh) [Reset = X]

ALE_OAM_LB_CTRL is shown in [Table 9-444](#).

Return to the [Summary Table](#).

The ALE OAM Control allows ports to be put into OAM Loopback, only non-supervisor packet are looped back to the source port.

Table 9-444. ALE_OAM_LB_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	X	
1-0	OAM_LB_CTRL	R/W	0h	The ~ioam_lb_ctrl allows any port to be put into OAM loopback, that is any packet received will be returned to the same port with an egress of 0xFF which swaps the source and destination address. BPDUs will still flow through as normal so that OAM can be remotely requested and disabled.

9.6.413 ALE_MSK_MUX0 Register (Offset = 0003E0C0h) [Reset = X]

ALE_MSK_MUX0 is shown in [Table 9-445](#).

Return to the [Summary Table](#).

VLAN Mask Mux x - The ALE Mask Mux registers are used along with the VLAN registered/unregistered index selectors from the Lookup Table to determine the value for vlan registered and unregistered mask respectively.

Table 9-445. ALE_MSK_MUX0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R	X	
1-0	VLAN_MASK_MUX_0	R	3h	VLAN Mask Mux x - When selected by the VLAN lookup table entry FwdUnRegIdx or FwdAllRegIdx is used as the FwdUnRegMask or FwdUnRegMask values anded with the member list to determine the forwarding of packets. The Value of vlan_mask_mux_0 is read only and set to all ones for all ports.

9.6.414 I1_ALE_MSK_MUX1_y Register (Offset = 0003E0C4h + formula) [Reset = X]

I1_ALE_MSK_MUX1_y is shown in [Table 9-446](#).

Return to the [Summary Table](#).

VLAN Mask Mux x - The ALE Mask Mux registers are used along with the VLAN registered/unregistered index selectors from the Lookup Table to determine the value for vlan registered and unregistered mask respectively.

Offset = 0003E0C4h + (y * 4h); where y = 0h to 2h

Table 9-446. I1_ALE_MSK_MUX1_y Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	X	
1-0	I1_REG_VLAN_MASK_MUX_1	R/W	0h	VLAN Mask Mux x - When selected by the VLAN lookup table entry FwdUnRegIdx or FwdAllRegIdx is used as the FwdUnRegMask or FwdUnRegMask values anded with the member list to determine the forwarding of packets. The Value of vlan_mask_mux_0 is read only and set to all ones for all ports.

9.6.415 EGRESSOP Register (Offset = 0003E0FCh) [Reset = X]

EGRESSOP is shown in [Table 9-447](#).

Return to the [Summary Table](#).

The Egress Operation register allows enabled classifiers with IPSA or IPDA match to use the CPSW Egress Packet Operations Inter VLAN Routing sub functions. If the packet was destined for the host, but matches a classifier that has a programmed egress opcode, it will be forwarded to the destination ports where the destination ports will use the thier egress opcode entry to modify the packet. InterVLAN Routing and mirroring need to be understood, they are orthogonal functions.

Table 9-447. EGRESSOP Register Field Descriptions

Bit	Field	Type	Reset	Description
31-24	EGRESS_OP	R/W	0h	The Egress Operation defines the operation performed by the CPSW Egress Packet Operations 0: NOP : 1-n: Defines which egress Operation will be performed. This allows Inter VLAN routing to be configured for high bandwidth traffic, reducing CPU load. 0xff: Swap SA and DA of packet, this is intended to allow OAM diagnostics for a link.
23-21	EGRESS_TRK	R/W	0h	The Egress Trunk Index is the calculated trunk index from the SA, DA or VLAN if modified to that InterVLAN routing will work on trunks as well. The DA, SA and VLAN are ignored for trunk generation on InterVLAN Routing so that this field is the index generated from the Egress Op replacements exclusive or'd together into a three bit index.
20	TTL_CHECK	R/W	0h	The TTL Check will cause any packet that fails TTL checks to not be routed to the Inter VLAN Routing sub functions. The packet will be routed to the host it was destined to.
19-2	RESERVED	R/W	X	
1-0	DEST_PORTS	R/W	0h	The Destination Ports is a list of the ports the classified packet will be set to. If a destination is a Trunk, all the port bits for that trunk must be set.

9.6.416 POLICECFG0 Register (Offset = 0003E100h) [Reset = X]

POLICECFG0 is shown in [Table 9-448](#).

Return to the [Summary Table](#).

The Policing Config 0 holds the port, frame priority and ONU address index as well as match enables for port, frame priority and ONU address matching.

Table 9-448. POLICECFG0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PORT_MEN	R/W	0h	Port Match Enable - Enabled port match for the selected policing/classifier entry
30	TRUNKID	R/W	0h	Trunk ID - When set indicates the port number is a trunk group.
29-26	RESERVED	R/W	X	
25	PORT_NUM	R/W	0h	Port Number - Specifies the port address to match for the selected policing/classifier entry
24-20	RESERVED	R/W	X	
19	PRI_MEN	R/W	0h	Priority Match Enable - Enables frame priority match for the selected policing/classifier entry
18-16	PRI_VAL	R/W	0h	Priority Value - Specifies the frame priority to match for the selected policing/classifier entry
15	ONU_MEN	R/W	0h	OUI Match Enable - Enables frame ONU address match for the selected policing/classifier entry
14-5	RESERVED	R/W	X	
4-0	ONU_INDEX	R/W	0h	OUI Table Entry Index - Specifies the ALE ONU address lookup table index to match for the selected policing/classifier entry

9.6.417 POLICECFG1 Register (Offset = 0003E104h) [Reset = X]

POLICECFG1 is shown in [Table 9-449](#).

Return to the [Summary Table](#).

The Policing Config 1 holds the match enable/match index for the L2 Destination and L2 source addresses

Table 9-449. POLICECFG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DST_MEN	R/W	0h	Destination Address Match Enable - Enables frame L2 destination address match for the selected policing/classifier entry
30-21	RESERVED	R/W	X	
20-16	DST_INDEX	R/W	0h	Destination Address Table Entry Index - Specifies the ALE L2 destination address lookup table index to match for the selected policing/classifier entry
15	SRC_MEN	R/W	0h	Source Address Match Enable - Enables frame L2 source address match for the selected policing/classifier entry
14-5	RESERVED	R/W	X	
4-0	SRC_INDEX	R/W	0h	Source Address Table Entry Index - Specifies the ALE L2 source address lookup table index to match for the selected policing/classifier entry

9.6.418 POLICECFG2 Register (Offset = 0003E108h) [Reset = X]

POLICECFG2 is shown in [Table 9-450](#).

Return to the [Summary Table](#).

The Policing Config 2 holds the match enable/match index for the Outer VLAN and Inner VLAN addresses

Table 9-450. POLICECFG2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	OVLAN_MEN	R/W	0h	Outer VLAN Match Enable - Enables frame Outer VLAN address match for the selected policing/classifier entry
30-21	RESERVED	R/W	X	
20-16	OVLAN_INDEX	R/W	0h	Outer VLAN Table Entry Index - Specifies the ALE Outer VLAN address lookup table index to match for the selected policing/classifier entry
15	IVLAN_MEN	R/W	0h	Inner VLAN Match Enable - Enables frame Inner VLAN address match for the selected policing/classifier entry
14-5	RESERVED	R/W	X	
4-0	IVLAN_INDEX	R/W	0h	Inner VLAN Table Entry Index - Specifies the ALE Inner VLAN address lookup table index to match for the selected policing/classifier entry

9.6.419 POLICECFG3 Register (Offset = 0003E10Ch) [Reset = X]

POLICECFG3 is shown in [Table 9-451](#).

Return to the [Summary Table](#).

The Policing Config 3 holds the match enable/match index for the Ether Type and IP Source address

Table 9-451. POLICECFG3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ETHERTYPE_MEN	R/W	0h	EtherType Match Enable - Enables frame Ether Type match for the selected policing/classifier entry
30-21	RESERVED	R/W	X	
20-16	ETHERTYPE_INDEX	R/W	0h	EtherType Table Entry Index - Specifies the ALE Ether Type lookup table index to match for the selected policing/classifier entry
15	IPSRC_MEN	R/W	0h	IP Source Address Match Enable - Enables frame IP Source address match for the selected policing/classifier entry
14-5	RESERVED	R/W	X	
4-0	IPSRC_INDEX	R/W	0h	IP Source Address Table Entry Index - Specifies the ALE IP Source address lookup table index to match for the selected policing/classifier entry

9.6.420 POLICECFG4 Register (Offset = 0003E110h) [Reset = X]

POLICECFG4 is shown in [Table 9-452](#).

Return to the [Summary Table](#).

The Policing Config 4 holds the match enable/match index for the IP Destination address

Table 9-452. POLICECFG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IPDST_MEN	R/W	0h	IP Destination Address Match Enable - Enables frame IP Destination address match for the selected policing/classifier entry
30-21	RESERVED	R/W	X	
20-16	IPDST_INDEX	R/W	0h	IP Destination Address Table Entry Index - Specifies the ALE IP Destination address lookup table index to match for the selected policing/classifier entry
15-0	RESERVED	R/W	X	

9.6.421 POLICECFG6 Register (Offset = 0003E118h) [Reset = 00000000h]

POLICECFG6 is shown in [Table 9-453](#).

Return to the [Summary Table](#).

The PIR counter is a 37 bit internal counter where `~ipir_idle_inc_val` is added every clock and the frame size `<< 18` is subtracted at EOF if not RED at LUT time. If the counter is negative the packet will be marked RED, else it can be YELLOW or GREEN based on the CIR counter. If only this counter is used (aka `cir_idle_inc_val==0`) Packet are marked RED or GREEN based on PIR counter only.

Table 9-453. POLICECFG6 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	PIR_IDLE_INC_VAL	R/W	0h	Peak Information Rate Idle Increment Value - The number added to the PIR counter every clock cycle. If zero the PIR counter is disabled and packets will never be marked or processed as RED.

9.6.422 POLICECFG7 Register (Offset = 0003E11Ch) [Reset = 00000000h]

POLICECFG7 is shown in [Table 9-454](#).

Return to the [Summary Table](#).

The CIR counter is a 37 bit internal counter where `~icir_idle_inc_val` is added every clock and the frame size `<< 18` is subtracted at EOF if not RED or YELLOW at LUT time. If the counter is positive the packet will be marked GREEN, else it can be YELLOW or RED based on the PIR counter. If only this counter is used (aka `pir_idle_inc_val==0`) Packet are marked YELLOW or GREEN based on CIR counter only.

Table 9-454. POLICECFG7 Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	CIR_IDLE_INC_VAL	R/W	0h	Committed Information Idle Increment Value - The number added to the CIR counter every clock cycle. If zero the CIR counter is disabled and packets will never be marked or processed as YELLOW.

9.6.423 POLICETBLCTL Register (Offset = 0003E120h) [Reset = X]

POLICETBLCTL is shown in [Table 9-455](#).

Return to the [Summary Table](#).

The Policing Table Control is used to read or write the selected policing/classifier entry. The selected policing/classifier entry is only read or written after this register is written based on the value of the `~iwrite_enable` bit.

Table 9-455. POLICETBLCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	WRITE_ENABLE	R/W	0h	Write Enable - Setting this bit will write the POLICECFG0-7 to the <code>~ipol_tbl_idx</code> selected policing/classifier entry. Clearing this bit will read the <code>~ipol_tbl_idx</code> selected policing/classifier entry into the POLICECFG0-7 registers.
30-2	RESERVED	R/W	X	
1-0	POL_TBL_IDX	R/W	0h	Policer Entry Index - This field specifies the policing/classifier entry to be read or written. When writing to this field without setting the <code>~iwrite_enable=1</code> will cause the selected policing/classifier entry to be loaded into the POLICECFG0-7 registers. When writing to this field with setting the <code>~iwrite_enable=1</code> will cause the selected policing/classifier entry to be updated from the POLICECFG0-7 registers.

9.6.424 POLICECONTROL Register (Offset = 0003E124h) [Reset = X]

POLICECONTROL is shown in [Table 9-456](#).

Return to the [Summary Table](#).

The Control Enables color marking as well as internal ALE packet dropping rules.

Table 9-456. POLICECONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	POLICING_EN	R/W	0h	Policing Enable - Enables the policing to color the packets, this also enables red or yellow drop capabilities.
30	RESERVED	R/W	X	
29	RED_DROP_EN	R/W	0h	RED Drop Enable - Enables the ALE to drop the red colored packets.
28	YELLOW_DROP_EN	R/W	0h	YELLOW Drop Enable - Enables the ALE to drop yellow packets based on the ~iyellowthresh value. This field would normally not be used as to let the switch drop packets at a buffer threshold instead. In the event that the switch does not enable buffer threshold dropping, YELLOW packets can be dropped based on this feature.
27	RESERVED	R/W	X	
26-24	YELLOWTHRESH	R/W	0h	Yellow Threshold - When set enables a portion of the yellow packets to be dropped based on the ~iyellow_drop_en enable. 0-100% 1=50% 2=33% 3=25% 4=20% 5=17% 6=14% 7=13%
23-22	POLMCHMODE	R/W	0h	Policing Match Mode - This field determines what happens to packets that fail to hit any policing/classifier entry. 0 - No Hit packets are marked GREEN 1 - No Hit packets are marked YELLOW 2 - No Hit packets are marked RED 3 - No Hit packets are marked based on policing/classifier entry=0 state.
21	PRIORITY_THREAD_EN	R/W	0h	Priority Thread Enable - This field determines if priority is OR'd to the default thread when no classifiers hit and the default thread is enabled.
20	MAC_ONLY_DEF_DIS	R/W	0h	MAC Only Default Disable - This field when set disables the default thread on MAC Only Ports. That is the default thread will be {port,priority}. If the traffic matches a classifier with a thread mapping, the classifier thread mapping still occurs.
19-0	RESERVED	R/W	X	

9.6.425 POLICETESTCTL Register (Offset = 0003E128h) [Reset = X]

POLICETESTCTL is shown in [Table 9-457](#).

Return to the [Summary Table](#).

The Policing Test Control enables the ability to determine which policing entry has been hit and whether they reported a red or yellow rate condition.

Table 9-457. POLICETESTCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	POL_CLRALL_HIT	R/W	0h	Policer Clear - This bit clears all the policing/classifier hit bits. This bit is self clearing. This can be used to test the fact that a policing/classifier entry has been hit.
30	POL_CLRALL_REDHIT	R/W	0h	Policer Clear RED - This bit clears all the policing/classifier RED hit bits. This bit is self clearing. This can be used to test the fact that a policing/classifier entry has been hit during a RED condition.
29	POL_CLRALL_YELLOWHIT	R/W	0h	Policer Clear YELLOW - This bit clears all the policing/classifier YELLOW hit bits. This bit is self clearing. This can be used to test the fact that a policing/classifier entry has been hit during a YELLOW condition.
28	POL_CLRSEL_ALL	R/W	0h	Police Clear Selected - This bit clears the selected policing/classifier hit, redhit and yellowhit bits. This bit is self clearing.
27-2	RESERVED	R/W	X	
1-0	POL_TEST_IDX	R/W	0h	Policer Test Index - This field selects which policing/classifier hit bits will be read or written.

9.6.426 POLICEHSTAT Register (Offset = 0003E12Ch) [Reset = X]

POLICEHSTAT is shown in [Table 9-458](#).

Return to the [Summary Table](#).

The policing hit status is a read only register that reads the hit bits of the selected policing/classifier.

Table 9-458. POLICEHSTAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	POL_HIT	R	0h	Policer Hit - This indicates that the selected policing/classifier via the ~ipol_test_idx field has been hit by a packet seen on any port that matches the policing/classifier entry match.
30	POL_REDHIT	R	0h	Policer Hit RED - This indicates that the selected policing/classifier via the ~ipol_test_idx field has been hit during a RED condition by a packet seen on any port that matches the policing/classifier entry match.
29	POL_YELLOWHIT	R	0h	Policer Hit YELLOW - This indicates that the selected policing/classifier via the ~ipol_test_idx field has been hit during a YELLOW condition by a packet seen on any port that matches the policing/classifier entry match.
28-0	RESERVED	R	X	

9.6.427 THREADMAPDEF Register (Offset = 0003E134h) [Reset = X]

THREADMAPDEF is shown in [Table 9-459](#).

Return to the [Summary Table](#).

The THREAD Mapping Default Value register is used to set the default thread ID when no classifier is matched,

Table 9-459. THREADMAPDEF Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R/W	X	
15	DEFTHREAD_EN	R/W	0h	Default Tread Enable - When set the switch will use the ~idefthreadval for the host interface thread ID if no classifier is matched. If clear the switch will generate its own thread ID based on port and priority if there is no classifier match.
14-6	RESERVED	R/W	X	
5-0	DEFTHREADVAL	R/W	0h	Default Thread Value - This field specifies the default thread ID value.

9.6.428 THREADMAPCTL Register (Offset = 0003E138h) [Reset = X]

THREADMAPCTL is shown in [Table 9-460](#).

Return to the [Summary Table](#).

The THREAD Mapping Control register allows the highest matched classifier to return a particular thread ID for traffic sent to the host. This allows particular classifier matched traffic to be placed on a particular host's queue.

Table 9-460. THREADMAPCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RESERVED	R/W	X	
1-0	CLASSINDEX	R/W	0h	Classifier Index - This is the classifier index entry that the thread enable and thread value will be read or written by the ~bTHREADMAPVAL register.

9.6.429 THREADMAPVAL Register (Offset = 0003E13Ch) [Reset = X]

THREADMAPVAL is shown in [Table 9-461](#).

Return to the [Summary Table](#).

The THREAD Mapping Value register is used to set the thread ID for a particular classifier entry.

Table 9-461. THREADMAPVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-16	RESERVED	R/W	X	
15	THREAD_EN	R/W	0h	Thread Enable - When set the switch will use the ~ithreadval for the selected classifier match. If clear the the thread ID will be determined by the ~bTHREADMAPDEF register settings.
14-6	RESERVED	R/W	X	
5-0	THREADVAL	R/W	0h	Thread Value - This field is the thread ID value that is used to map a classifier hit to thread ID for host traffic.

9.6.430 rev Register (Offset = 0003F000h) [Reset = 66A01A01h]

rev is shown in [Table 9-462](#).

Return to the [Summary Table](#).

Revision parameters

Table 9-462. rev Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	scheme	R	1h	Scheme
29-28	bu	R	2h	bu
27-16	module_id	R	6A0h	Module ID
15-11	revrtl	R	3h	RTL version
10-8	revmaj	R	2h	Major version
7-6	custom	R	0h	Custom version
5-0	revmin	R	1h	Minor version

9.6.431 vector Register (Offset = 0003F008h) [Reset = X]

vector is shown in [Table 9-463](#).

Return to the [Summary Table](#).

ECC Vector Register

Table 9-463. vector Register Field Descriptions

Bit	Field	Type	Reset	Description
31-25	RESERVED	R/W	X	
24	rd_svbus_done	R/W1C	0h	Status to indicate if read on serial VBUS is complete, write of any value will clear this bit.
23-16	rd_svbus_address	R/W	0h	Read address
15	rd_svbus	R/W1S	0h	Write 1 to trigger a read on the serial VBUS
14-11	RESERVED	R/W	X	
10-0	ecc_vector	R/W	0h	Value written to select the corresponding ECC RAM for control or status

9.6.432 stat Register (Offset = 0003F00Ch) [Reset = X]

stat is shown in [Table 9-464](#).

Return to the [Summary Table](#).

Misc Status

Table 9-464. stat Register Field Descriptions

Bit	Field	Type	Reset	Description
31-11	RESERVED	R	X	
10-0	num_rams	R	14h	Indicates the number of RAMS serviced by the ECC aggregator

9.6.433 reserved_svbus_y Register (Offset = 0003F010h + formula) [Reset = 00000000h]

reserved_svbus_y is shown in [Table 9-465](#).

Return to the [Summary Table](#).

Reference other documents that contain the ECC RAM wrapper and EDC controller serial vbus register sets.

Offset = 0003F010h + (y * 4h); where y = 0h to 7h

Table 9-465. reserved_svbus_y Register Field Descriptions

Bit	Field	Type	Reset	Description
31-0	data	R/W	0h	Serial VBUS register data

9.6.434 sec_eoi_reg Register (Offset = 0003F03Ch) [Reset = X]

sec_eoi_reg is shown in [Table 9-466](#).

Return to the [Summary Table](#).

Chapter 10

Quad Serial Peripheral Interface (QSPI)

10.1 Quad Serial Peripheral Interface Overview.....	2944
10.2 QSPI Environment.....	2945
10.3 QSPI Functional Description.....	2946
10.4 QSPI Registers.....	2955

10.1 Quad Serial Peripheral Interface Overview

The quad serial peripheral interface (QSPI) module is a kind of SPI module that allows single, dual, or quad read access to external SPI devices. This module has a memory mapped register interface, which provides a direct interface for accessing data from external SPI devices and thus simplifying software requirements. The QSPI works as a controller only.

The one QSPI in the device is primarily intended for fast booting from quad-SPI flash memories. [Figure 10-1](#) shows the QSPI module overview.

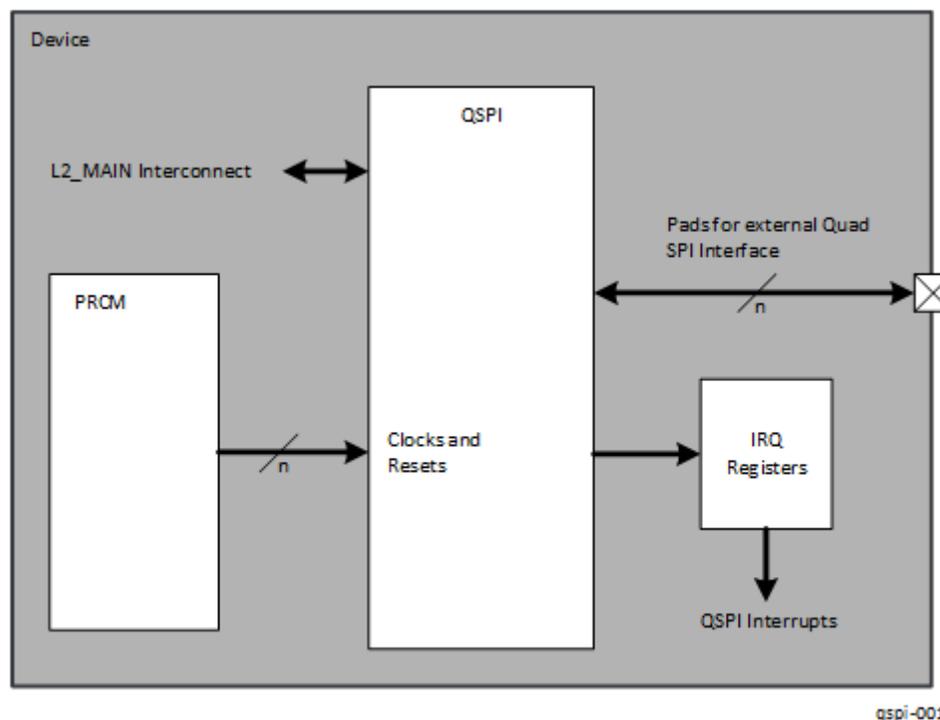

Figure 10-1. QSPI Overview

The QSPI supports the following features:

- General SPI features:
 - Programmable clock divider
 - Max four pin interface
 - Programmable length (from 1 to 128 bits) of the words transferred
 - Programmable number (from 1 to 4096) of the words transferred
 - 1 external chip-select signal
 - Support for 1 pin Write. Dual or quad writes are not supported
 - Support for 1-, 2-, or 4-pin SPI interface
 - Optional interrupt generation on word or frame (number of words) completion
 - Programmable delay between chip select activation and output data from 0 to 3 QSPI clock cycles
 - Programmable signal polarities
 - Programmable active clock edge
 - Software-controllable interface allowing for any type of SPI transfer
 - Control through L2_MAIN configuration port
- Serial flash interface (SFI) features:
 - Serial flash read/write interface
 - Additional registers for defining read and write commands to the external serial flash device
 - External flash support of up to 8 MB

- Fast read support, where fast read requires dummy bytes after address bytes; 0 to 3 dummy bytes can be configured.
- Dual read support
- Quad read support
- Little-endian support (only for memory mapped registers used to configure QSPI controller and not SPI content accesses)
- Linear increment addressing mode only

The QSPI supports only dual and quad reads. Dual or quad writes are not supported. In addition, there is no "pass through" mode supported where the data present on the QSPI input is sent to its output.

Note

The QSPI module does not support cache line wrap mode.

10.2 QSPI Environment

Figure 10-2 shows a typical connection of the QSPI module to the external quad-SPI flash memory.

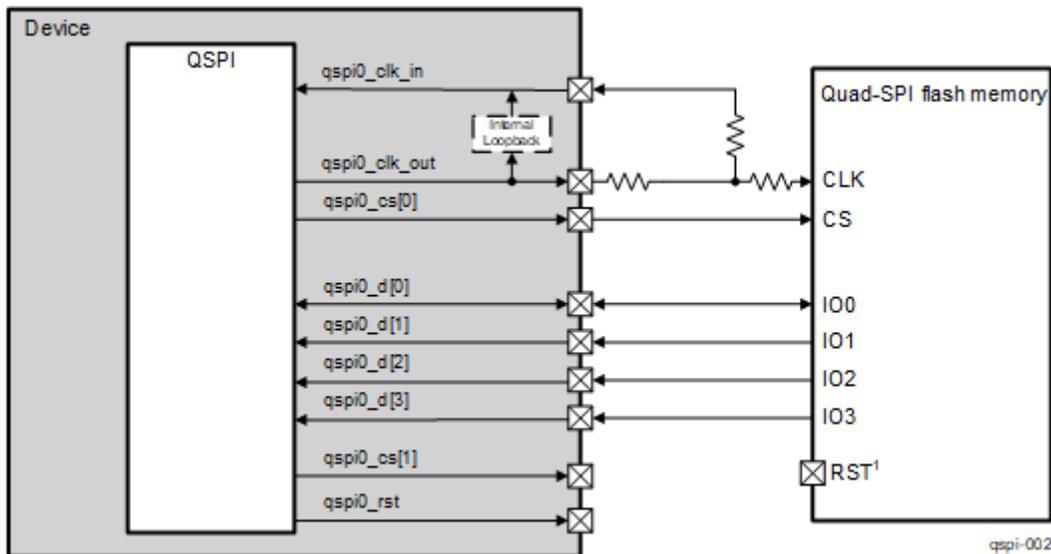

Figure 10-2. QSPI Connected to an External Quad-SPI Flash Memory

1. External flash memories that are larger than 128 Mb require an external reset pin for correct operation after SoC PORz reset. This reset must be triggered upon board reset to ensure the flash is in the correct state upon boot.

Table 10-1 lists and describes the QSPI I/O signals.

Table 10-1. QSPI I/O Signals

QSPI Signal/Pad name	I/O ⁽¹⁾	Description					
		3-pin ⁽²⁾ SPI Read (Single Read)	3-pin ⁽²⁾ SPI Write (Single Write)	4-pin ⁽²⁾ SPI Read (Single Read)	4-pin ⁽²⁾ SPI Write (Single Write)	4-pin ⁽²⁾ SPI Read (Dual Read)	6-pin ⁽²⁾ SPI Read (Quad Read)
qspi0_d[0]	IO	Used as SPI data input	Used as SPI data output	Not used	Used as SPI data output	Used as SPI data input 0	Used as SPI data input 0

qspi0_d[3]	I	Not used	Not used	Not used	Not used	Not used	Used as SPI data input 3

Table 10-1. QSPI I/O Signals (continued)

QSPI Signal/Pad name	I/O ⁽¹⁾	Description					
		3-pin ⁽²⁾ SPI Read (Single Read)	3-pin ⁽²⁾ SPI Write (Single Write)	4-pin ⁽²⁾ SPI Read (Single Read)	4-pin ⁽²⁾ SPI Write (Single Write)	4-pin ⁽²⁾ SPI Read (Dual Read)	6-pin ⁽²⁾ SPI Read (Quad Read)
qspi0_sclk	O	Clock for the external SPI device					
qspi0_cs[0]	O	External SPI device chip-select 0					
qspi0_rtclock	I	The qspi0_sclk output must be connected to the qspi0_rtclock input, and is used for controlling the timing of the read return data when the QSPI module operates in Mode 0. In case Mode 3 is used, there is no need to connect the qspi0_sclk to the qspi0_rtclock.					

(1) I = Input; O = Output

(2) This is the pin count at the SPI flash memory side. The pin count at the device side is increased by one because of the qspi0_rtclock signal. References to the pin count throughout this chapter consider the pin count at the SPI flash memory side.

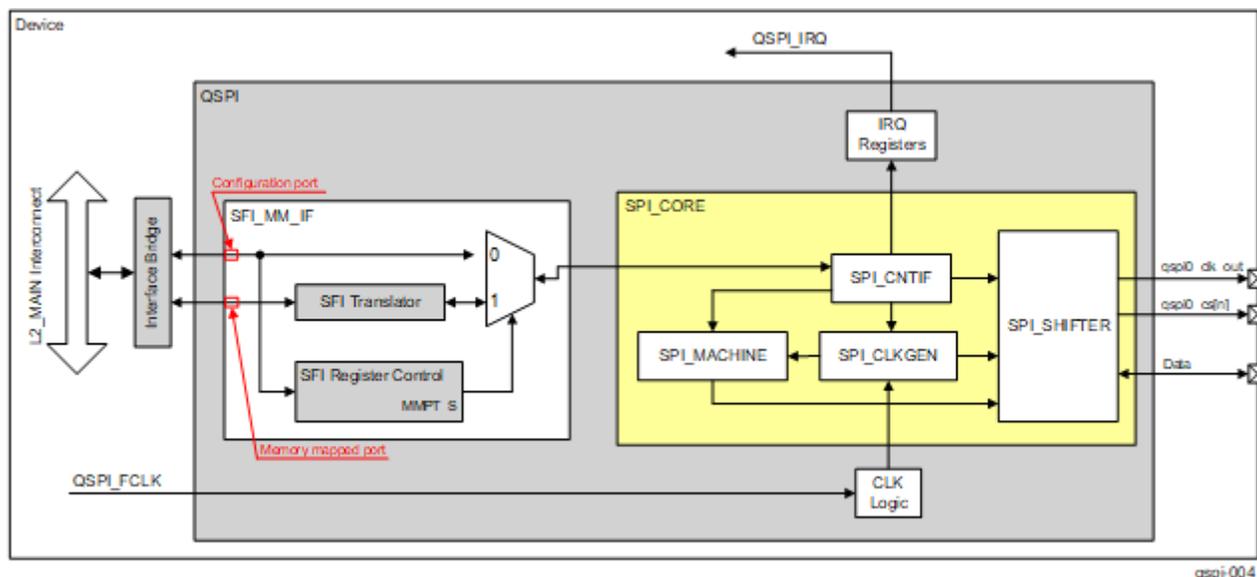

Note

To ensure proper timing, precise layout and routing requirements must be followed. For layout and routing requirements for all QSPI signals, see section “PCB Guidelines” of the device Data Manual.

10.3 QSPI Functional Description

10.3.1 QSPI Block Diagram

Initial device boot from external SPI flash memory can be accomplished through the QSPI module. The interface is a simple 4-wire SPI used for control or data transfers. The QSPI also supports a 3-wire SPI protocol where the qspi0_d[0] signal is used as a bidirectional for reads and writes. In addition, a 6-wire mode can be used to support quad read devices. [Figure 10-3](#) shows the QSPI block diagram.

Figure 10-3. QSPI Block Diagram

The QSPI is composed of two blocks. The first one is the SFI memory-mapped interface (SFI_MM_IF) and the second one is the SPI core (SPI_CORE). The SFI_MM_IF block is associated only with SPI flash memories and is used for specifying typical for the SPI flash memories settings (read or write command, number of address and dummy bytes, and so on) unlike the SPI_CORE block, which is associated with the SPI interface itself and is used to configure typical SPI settings (chip-select polarity, serial clock inactive state, SPI clock mode, length of the words transferred, and so on).

The SFI_MM_IF comprises the following two subblocks:

- SFI register control
- SFI translator

The SPI_CORE comprises the following four subblocks:

- SPI control interface (SPI_CNTIF)
- SPI clock generator (SPI_CLKGEN)
- SPI control state machine (SPI_MACHINE)
- SPI data shifter (SPI_SHIFTER)

In addition, an interface bridge connects the two ports (configuration port and memory-mapped port) of the SFI_MM_IF block to the L2_MAIN interconnect. There are no software controls associated with this interface bridge.

The QSPI supports long transfers through a frame-style sequence. In its generic SPI use mode, a word can be defined up to 128 bits and multiple words can be transferred during a single access. For each word, a device initiator must read or write the new data and then tell the QSPI to continue the current operation. Using this sequence, a maximum of 4096 128-bit words can be transferred in a single SPI read or write operation. This allows great flexibility when connecting the QSPI to various types of devices.

As opposed to the generic SPI use mode, the communication with serial flash-type devices requires sending a byte command, followed by sending bytes of data. Commands can be sent through the SPI_CORE block to communicate with a serial flash device; however, it is easier to do this using the SFI_MM_IF block because it is intended to ease the communication with serial flash devices. If the SPI_CORE is used to communicate with a serial flash device, software must load the command into the SPI data transfer register with additional configuration fields, perform the byte transfer, then place the data to be sent (or configure for receive) along with additional configuration fields, and perform that transfer. Reads and writes to serial flash devices are more specific. First, the read or write command byte is sent, followed by 1 to 4 bytes of address (corresponding to the address to read/write), then followed by the data write/receive phase. Data is always sent byte oriented. When the address is loaded, data can be continuously read or written, and the address will automatically increment to each byte address internally to the serial flash device.

Note

The SFI_MM_IF block only allows reading and writing to an externally connected SPI flash device. The SFI_MM_IF block does not allow reads or writes to internal configuration and status registers of the SPI flash device. These registers must be accessed through the features of the SPI_CORE block.

10.3.1.1 SFI Register Control

The SFI register control block consists of the following five configuration registers:

- QSPI_SPI_SETUP0_REG
- QSPI_SPI_SETUP1_REG
- QSPI_SPI_SETUP2_REG
- QSPI_SPI_SETUP3_REG
- QSPI_SPI_SWITCH_REG

The first four registers let the user define the following:

- Byte command for a serial flash read specified by the QSPI_SPI_SETUP_i_REG[7:0] RCMD bit field
- Byte command for a serial flash write specified by the QSPI_SPI_SETUP_i_REG[23:16] WCMD bit field
- Number of address bytes required for the particular type of serial flash specified by the QSPI_SPI_SETUP_i_REG[9:8] NUM_A_BYTES bit field
- Number of "dummy bytes" that may be needed to support the fast read mode function of some serial flash devices. The QSPI_SPI_SETUP_i_REG[11:10] NUM_D_BYTES bit field specifies the number of "dummy bits." In addition, the QSPI_SPI_SETUP_i_REG[28:24] NUM_D_BITS bit field can also specify the number of "dummy bits."

- Whether the read command is single (normal), dual, or quad read mode command. This is specified by the QSPI_SPI_SETUP_i_REG[13:12] READ_TYPE bit field.
- *i* is equal to 0, 1, 2 and 3 and means that the QSPI_SPI_SETUP_i_REG registers are associated with each of the four supported chip-selects [that is, four supported output SPI flash devices]

The QSPI_SPI_SWITCH_REG register acts as a static switch which allows the configuration port (shown in [Figure 10-3](#)) to connect directly to the SPI_CORE block, or allows the memory-mapped port (also shown in [Figure 10-3](#)) to connect to the SPI_CORE block. This is done using the QSPI_SPI_SWITCH_REG[0] MMPT_S bit.

In addition, the QSPI_SPI_SWITCH_REG[1] MM_INT_EN bit is used to enable or disable the word complete interrupt during operations using the memory-mapped port.

10.3.1.2 SFI Translator

The SFI translator block represents an FSM which, based on the configuration information loaded into the SFI register control block, converts each input read/write sequence into an SPI_CORE configuration sequence for access to the external serial flash memory.

A read sequence is converted into the following actions:

1. SPI chip-select goes active.
2. Read command byte is issued.
3. 1 to 4 address bytes, which correspond to the first address supplied, are issued.
4. 0 to 3 dummy bytes are issued, if “fast read” is supported.
5. Data bytes are read from the external SPI flash memory.
6. SPI chip-select goes inactive.

For linear addressing mode, action 5 is repeated until the byte count to be transferred reaches zero.

A write sequence is identical to a read sequence, except that a write sequence does not use dummy bytes.

Another important aspect with regard to writes is that a serial flash memory location can only be written to if the bits are erased in advance. Erased means the bits are set to 1. This means that writing only changes 1 contents to 0. It is not possible with this write to change the contents of a bit from 0 to 1. An erase command must be performed to do this operation. Erase commands cannot be executed on single byte locations. Depending on device types, there are page, block, and chip erase commands. To perform an erase command, the particular command must be sent over the SPI bus, and an internal register of the serial flash device must then be polled to determine when the erase completes. The erases must be done through the configuration port by software before performing any writes through the memory-mapped port. This means that writes are passed through to the serial flash device, but if the memory locations being modified are not properly erased before the write, the contents may not result in what was sent.

Note

The input to the SFI Memory Mapped Protocol Translator is 23 address lines. Therefore, the SFI mode of operation supports external flash size of up to 8MB

10.3.1.3 SPI Control Interface

The SPI control interface contains configuration registers used to configure the SPI core functionality of the QSPI. This block maintains all configuration settings for the SPI core (that is, settings specific for the SPI interface itself but not for the SPI flash memories).

The registers defined for this block are:

- The QSPI_PID register, which is read only and contains QSPI revision associated information
- The QSPI_SPI_CLOCK_CNTRL_REG register, which is used to control external SPI clock (qspi0_sclk)
- The QSPI_SPI_DC_REG register used to define the SPI clock mode and chip-select polarity for the four external SPI devices

- The QSPI_SPI_CMD_REG register used to control the operation of the SPI command. This register is also used to configure and transfer data.
 - Four data registers used for reading the data received and for writing the data to be transferred. These registers are:
 - QSPI_SPI_DATA_REG
 - QSPI_SPI_DATA_REG_1
 - QSPI_SPI_DATA_REG_2
 - QSPI_SPI_DATA_REG_3
- These four registers compose a 128-bit shift register.
- The QSPI_SPI_STATUS_REG register, which contains status information

All of these registers can only be written if the QSPI is not busy. This means that they can be written if the QSPI_SPI_STATUS_REG[0] BUSY bit is 0x0. The QSPI becomes busy when a write to the QSPI_SPI_CMD_REG[18:16] CMD bit field is performed. Writing to this bit field starts an SPI transaction and sets the QSPI_SPI_STATUS_REG[0] BUSY bit to 0x1. The CMD bit field can be written again when the BUSY bit is 0x0. In addition, the start of the SPI transaction is synchronized to the qspi0_sclk clock and clearing of the BUSY bit is synchronized to the QSPI_FCLK clock.

The register group QSPI_SPI_DATA_REG_3, QSPI_SPI_DATA_REG_2, QSPI_SPI_DATA_REG_1 and QSPI_SPI_DATA_REG is treated as a single 128-bit word for shifting data in and out. The QSPI_SPI_DATA_REG_3 register is used for the most significant bits and the QSPI_SPI_DATA_REG is used for the least significant bits. This applies for both reads and writes. For example, after reading a 128-bit word (WLEN = 0x7F) the most significant bit of the data read, that is bit 127, will be located at QSPI_SPI_DATA_REG_3[31] position and the least significant bit, that is bit 0 of the data read, will be located at the QSPI_SPI_DATA_REG[0] position.

The data written to this register group should be right justified so that a data pre-shifting is not required. The QSPI_SPI_CMD_REG[25:19] WLEN bit field determines the location of the most significant bit and the bit position that will be shifted out first during a write. In order to shift out byte data the WLEN bit field should be set to 0x7 and the data byte should be written to the lower byte of the QSPI_SPI_DATA_REG register. By setting the word length to 0x7 the QSPI_SPI_DATA_REG register will look like a pseudo 8-bit shift register. When the user wants to write 40-bit long word the WLEN bit field should be set to 0x27, the 32 least significant bits of data should be written to the QSPI_SPI_DATA_REG and the rest 8 most significant bits of data should be written to the lower byte of the QSPI_SPI_DATA_REG_1 register. By setting WLEN to 0x27 these two registers will look like a pseudo 40-bit shift register. When the word length is greater than 64 bits the QSPI_SPI_DATA_REG_2 register is also used and the previously described logic applies. The QSPI_SPI_DATA_REG_3 register is used together with the other three data registers when the word length is greater than 96 bits.

When dual or quad read mode is used the number of the words transferred must be even. This number is configured through the QSPI_SPI_CMD_REG[11:0] FLEN bit field.

Note

The QSPI module does not support a "pass through" mode where the data present on qspi0_d[1] is sent to qspi0_d[0], when 4-pin non-dual read mode is used. This means that setting the QSPI_SPI_CMD_REG[18:16] CMD bit field to 0x1 causes the QSPI only to read from an external device using the qspi0_d[1] pad as an input and if a write to the same external device is desired, the CMD bit field should be set to 0x2, which causes the qspi0_d[0] pad to be used as an output.

10.3.1.4 SPI Clock Generator

The SPI clock generator uses the QSPI_FCLK clock as an input, and generates the qspi0_sclk, which is a divided version of the QSPI_FCLK clock. The divide ratio is a 16-bit value configured through the QSPI_SPI_CLOCK_CNTRL_REG[15:0] DCLK_DIV bit field and thus provides a division factor in a range from 1 to 65536. The QSPI_FCLK clock is divided by the DCLK_DIV value + 1 to provide the qspi0_sclk clock. When DCLK_DIV = 0x0 the QSPI_FCLK clock equals the DCLK clock. The value in the DCLK_DIV bit field

applies only when the QSPI_SPI_CLOCK_CNTRL_REG[31] CLKEN bit is set to 0x1. Figure 10-4 shows the SPI_CLKGEN block.

If the CLKEN bit is 0x0 the command specified in the QSPI_SPI_CMD_REG[18:16] CMD bit field is not executed and the QSPI_SPI_STATUS_REG[0] BUSY bit is not set. The command is executed only if the CLKEN bit is 0x1 before write to the CMD bit field.

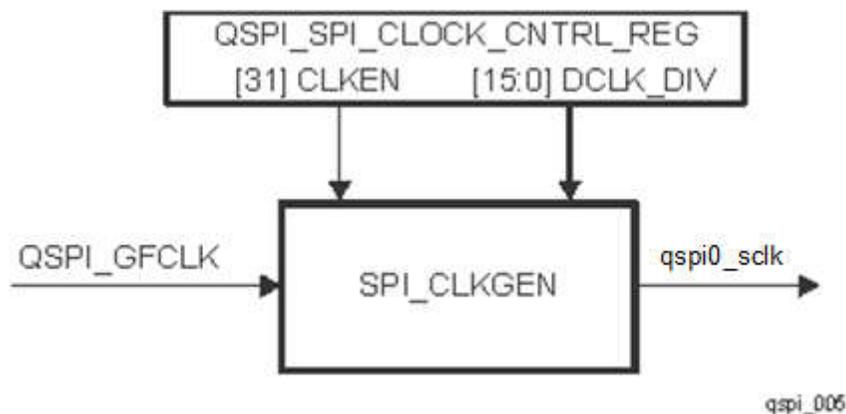

Figure 10-4. SPI_CLKGEN Block

10.3.1.5 SPI Control State-Machine

The SPI control state-machine (SPI_MACHINE) manages the operation of the SPI_CORE block. SPI_MACHINE takes control and configuration information from the registers in the SPI_CNTIF block as input and provides control information to the SPI data shifter. This information is used to control the SPI data port. The SPI_MACHINE also generates status information, which is sent back to the SPI_CNTIF block.

Writing a valid value to the QSPI_SPI_CMD_REG[18:16] CMD bit field sets immediately the QSPI_SPI_STATUS_REG[0] BUSY bit to 0x1, activates the corresponding qspi0_cs[n] (n = 0 to 1) and starts the SPI data transaction. The BUSY bit is cleared automatically when QSPI_SPI_CMD_REG[25:19] WLEN number of bits are shifted in or out. If the value of the QSPI_SPI_STATUS_REG@[27:16] WDCNT bit field is different than 0x0 and WLEN number of bits are shifted already, the SPI_MACHINE waits until another write to the CMD bit field is performed. If the command written to the CMD bit field is valid, then this increments the value of the WDCNT bit field from 0x0 and starts shifting data in or out again. This is repeated until the WDCNT bit field reaches the frame length (QSPI_SPI_CMD_REG[11:0] FLEN), that is, all words of the frame are shifted or till earlier frame termination occurs. While the SPI_MACHINE is waiting for write to the CMD bit field the corresponding qspi0_cs[n] (n = 0 to 1) remains active and the BUSY flag is set to 0x0. In addition, the bit length for each word can be changed during a frame from 1 to 128 bits using the QSPI_SPI_CMD_REG[25:19] WLEN bit field.

The SPI_MACHINE also provides a mechanism to terminate the frame earlier. This is done by writing an invalid command to the CMD bit field. An invalid command corresponds to the 0x0 and 0x4 (reserved) values of the CMD bit field. Writing one of these values when the the WDCNT bit field is not equal to 0x0 and when the BUSY flag is 0x0 terminates the frame earlier.

The corresponding qspi0_cs[n] (n = 0 to 1) becomes inactive when all words are shifted or when the frame terminates earlier.

10.3.1.6 SPI Data Shifter

The SPI data shifter handles the capture and generation of the SPI interface signals. Based on control signals from the SPI_MACHINE and SPI_CNTIF blocks, data is shifted in or out on falling or rising edge of qspi0_sclk clock depending on the SPI clock mode selected. Table 10-2 lists the four defined clock modes of operation for the QSPI.

Table 10-2. SPI Clock Modes Definition

Mode	Settings in the QSPI_SPI_DC_REG Register		Description
	Value of the CKP bits	Value of the CKPH bits	
0	0	0	Data input captured on falling edge of qspi0_sclk clock. Data output generated on falling edge of qspi0_sclk clock
1	0	1	Data input captured on rising edge of qspi0_sclk clock. Data output generated on rising edge of qspi0_sclk clock
2	1	0	Data input captured on rising edge of qspi0_sclk clock. Data output generated on rising edge of qspi0_sclk clock
3	1	1	Data input captured on falling edge of qspi0_sclk clock. Data output generated on falling edge of qspi0_sclk clock

Note

Mode 1 and Mode 2 are not supported and should not be used.

The CKPi and CKPHi (i = 0 to 3) bits of the QSPI_SPI_DC_REG register control the clock modes. Each of these 4 bits corresponds to an output chip select.

Figure 10-5 shows all four clock modes. In addition, through the DDi (i = 0 to 3) bits of the QSPI_SPI_DC_REG register the data can be delayed from one to three qspi0_sclk clock cycles after the corresponding qspi0_cs[n] (n = 0 to 1) goes active. The active state of each chip-select can also be controlled through the CSPi (i = 0 to 3) bits of the QSPI_SPI_DC_REG register.

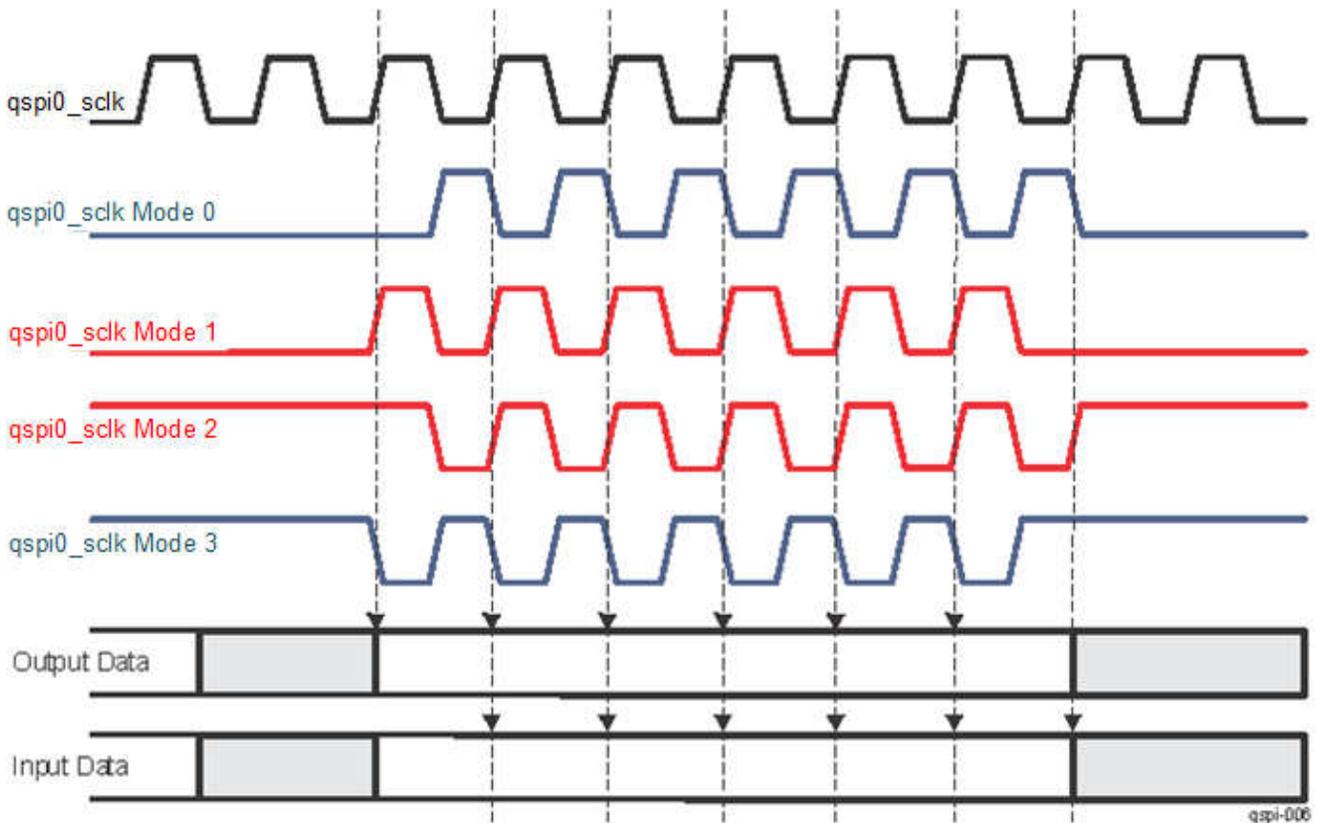

Figure 10-5. SPI Clock Modes

10.3.2 QSPI Clock Configuration

The QSPI complies with the PRCM peripheral-idle protocol. The QSPI_FCLK clock is gated based on the values loaded in the QSPI_SYSCONFIG[3:2] IDLE_MODE bit field. Three modes are supported:

- Force-idle: The QSPI_FCLK clock is gated unconditionally by the QSPI.
- No-idle: The QSPI_FCLK clock is never gated by the QSPI.
- Smart-idle: The QSPI_FCLK clock is gated by the QSPI, depending on its internal requirements.

10.3.3 QSPI Interrupt Requests

Figure 10-6 shows a logical representation of the QSPI interrupt generation scheme.

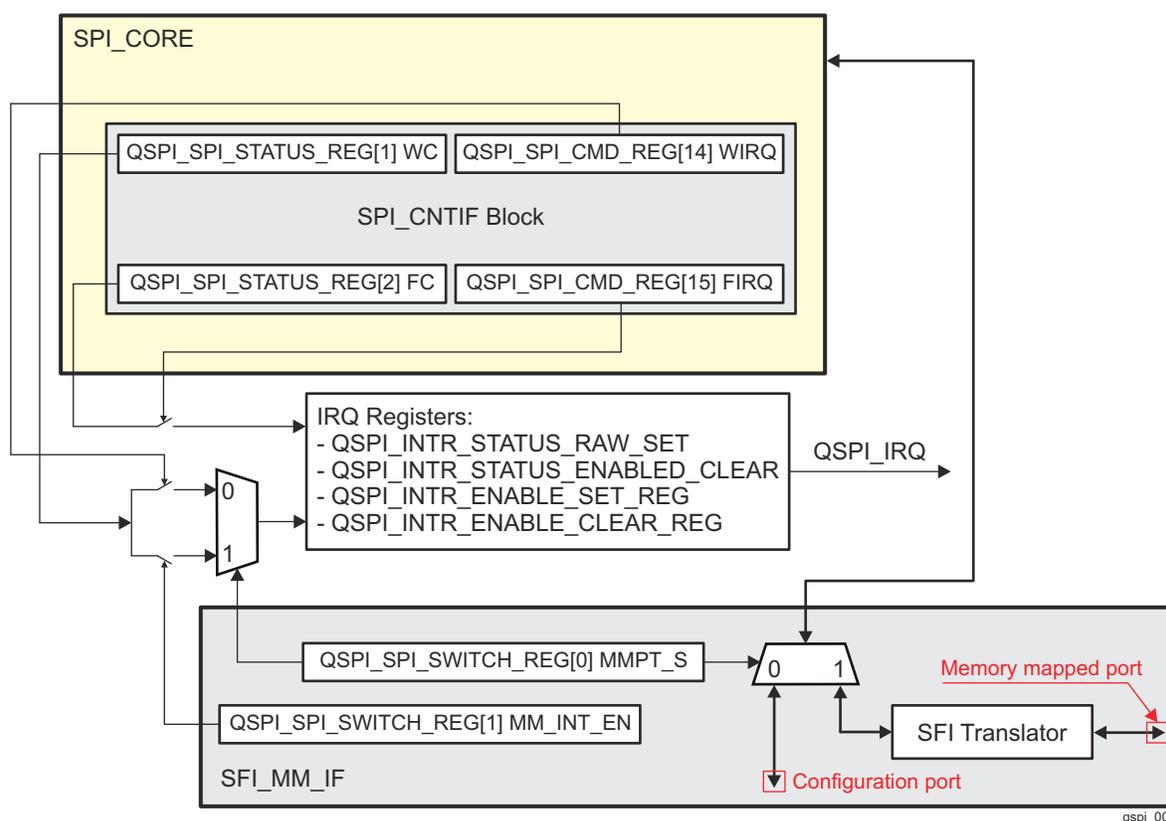

Figure 10-6. Logical Representation of the QSPI Interrupt Generation Scheme

QSPI_SPI_STATUS_REG[1] WC and QSPI_SPI_STATUS_REG[2] FC are status bits indicating whether word or frame transfer is complete. Setting the corresponding interrupt enable bit (WIRQ or FIRQ) in the QSPI_SPI_CMD_REG register allows these events (WC and FC) to generate an interrupt. The WC and FC bits are reset every time the user writes to the QSPI_SPI_CMD_REG register or reads the QSPI_SPI_STATUS_REG register. This is done to keep control parameters from changing the interface protocol signals while a transfer is in progress. Additionally, the QSPI_SPI_SWITCH_REG[1] MM_INT_EN bit is used to enable or disable the word complete interrupt during operations using the memory-mapped port.

When the QSPI_SPI_CMD_REG[14] WIRQ and QSPI_SPI_CMD_REG[15] FIRQ bits are set to 0x1 the following applies:

- The QSPI activates its interrupt line only if the interrupts are enabled by setting to 0x1 the corresponding bits in the QSPI_INTR_ENABLE_SET_REG register. These interrupts can be disabled by setting the corresponding bits in the QSPI_INTR_ENABLE_CLEAR_REG register to 0x1.
- After an interrupt has been serviced, software must clear the corresponding status flag. This is done by setting the corresponding bit in the QSPI_INTR_STATUS_ENABLED_CLEAR register to 0x1, which

also clears the corresponding bit in the QSPI_INTR_STATUS_RAW_SET register. The status flags in the QSPI_INTR_STATUS_RAW_SET register are set even if the corresponding interrupt is disabled unlike those in the QSPI_INTR_STATUS_ENABLED_CLEAR register, which are set only if the corresponding interrupt is enabled.

- The QSPI also generates an interrupt if a certain bit in the QSPI_INTR_STATUS_RAW_SET register is set to 0x1 and the corresponding interrupt is enabled through the QSPI_INTR_ENABLE_SET_REG register. This feature is useful during user software debugging. In addition, even if interrupts are not enabled a corresponding raw flag in the QSPI_INTR_STATUS_RAW_SET register is set to 0x1 when an IRQ condition occurs.
- Even if interrupts are not enabled, a certain status bit in the QSPI_INTR_STATUS_RAW_SET register can also be cleared by setting to 0x1 the corresponding bit in the QSPI_INTR_STATUS_ENABLED_CLEAR register.

It must be considered that the previously described scenario applies if the QSPI_SPI_CMD_REG[14] WIRQ and QSPI_SPI_CMD_REG[15] FIRQ bits are set to 0x1.

Note

The QSPI_IRQ interrupt line is activated only if at least one of the following conditions is met:

- The word complete interrupt is enabled:
 - during operations using the memory-mapped port by setting to 0x1 both the QSPI_SPI_SWITCH_REG[1] MM_INT_EN and QSPI_INTR_ENABLE_SET_REG[1] WIRQ_ENA_SET bits.
 - during operations using the configuration port by setting to 0x1 both the QSPI_SPI_CMD_REG[14] WIRQ and QSPI_INTR_ENABLE_SET_REG[1] WIRQ_ENA_SET bits.
- The frame complete interrupt is enabled setting to 0x1 both the QSPI_SPI_CMD_REG[15] FIRQ and QSPI_INTR_ENABLE_SET_REG[0] FIRQ_ENA_SET bits.

The QSPI_IRQ interrupt line is also activated when both the conditions are met.

Table 10-3 lists the event flags and the corresponding mask bits of the sources which can cause interrupts.

Table 10-3. QSPI Events

Event Flag	Event Mask	Description
QSPI_INTR_STATUS_RAW_SET[1] WIRQ_RAW QSPI_INTR_STATUS_ENABLED_CLEAR[1] WIRQ_ENA QSPI_SPI_STATUS_REG[1] WC	QSPI_INTR_ENABLE_SET_REG[1] WIRQ_ENA_SET QSPI_INTR_ENABLE_CLEAR_REG[1] WIRQ_ENA_CLR QSPI_SPI_CMD_REG[14] WIRQ	Word complete interrupt event. Asserted each time after a word is transferred or received.
QSPI_INTR_STATUS_RAW_SET[0] FIRQ_RAW QSPI_INTR_STATUS_ENABLED_CLEAR[0] FIRQ_ENA QSPI_SPI_STATUS_REG[2] FC	QSPI_INTR_ENABLE_SET_REG[0] FIRQ_ENA_SET QSPI_INTR_ENABLE_CLEAR_REG[0] FIRQ_ENA_CLR QSPI_SPI_CMD_REG[15] FIRQ	Frame complete interrupt event. Asserted each time after a frame is transferred or received.

Note

QSPI_IRQ can also be used to trigger DMA events

10.3.4 QSPI Memory Regions

Two memory regions are associated with the QSPI. The first memory region is dedicated to the configuration port. Using this memory region, all internal registers can be programmed and serial transfers made from the supported external SPI devices. The L2_MAIN start address at which the configuration port is available is

0x4820 0000. The second memory region is associated mainly with the memory-mapped port and is used for communication directly with one of the two supported external SPI devices. The memory region for device 1 starts at 0x6000 0000 and the memory region for device 2 starts at 0x6200 0000

It is important to keep in mind that the configuration port provides an access to all the QSPI registers listed in the register summary. These are configuration registers and also four data registers. The configuration registers are used to configure typical SPI and serial flash memory settings and the four data registers are used for read and write operations. When communicating with an external SPI device (but not an SPI flash memory) the SPI_CORE module should be used and the data exchanged is available through these four data registers, which can be accessed only through the configuration port.

10.4 QSPI Registers

10.4.1 QSPI Register Summary

Table 10-4. QSPI Registers Mapping Summary

Register Name	Type	Register Width (Bits)	Address Offset

Chapter 11

Enhanced Direct Memory Access (EDMA)

This section describes the Enhanced Direct Memory Access (EDMA) controller. For features applicable to the EDMA instances in the device, see the device-specific Integration section. The primary purpose of the EDMA controller is to service data transfers programmed between two memory-mapped follower endpoints on the device. The EDMA controller consists of two principle blocks:

- EDMA channel controllers: EDMA_TPCC
- EDMA transfer controllers: EDMA_TPTC

Devices can have multiple instances of EDMA channel controllers, each associated with multiple EDMA transfer controllers.

The EDMA channel controller serves as the user interface for the EDMA controller. The EDMA_TPCC includes parameter RAM (PaRAM), channel control registers, and interrupt control registers. The EDMA_TPCC serves to prioritize incoming software requests or events from peripherals, and submits transfer requests (TR) to the EDMA transfer controller.

The EDMA transfer controllers are responsible for data movement. The transfer request packets (TRP) submitted by the EDMA_TPCC contain the transfer context, based on which the transfer controller issues read/write commands to the source and destination addresses programmed for a given transfer.

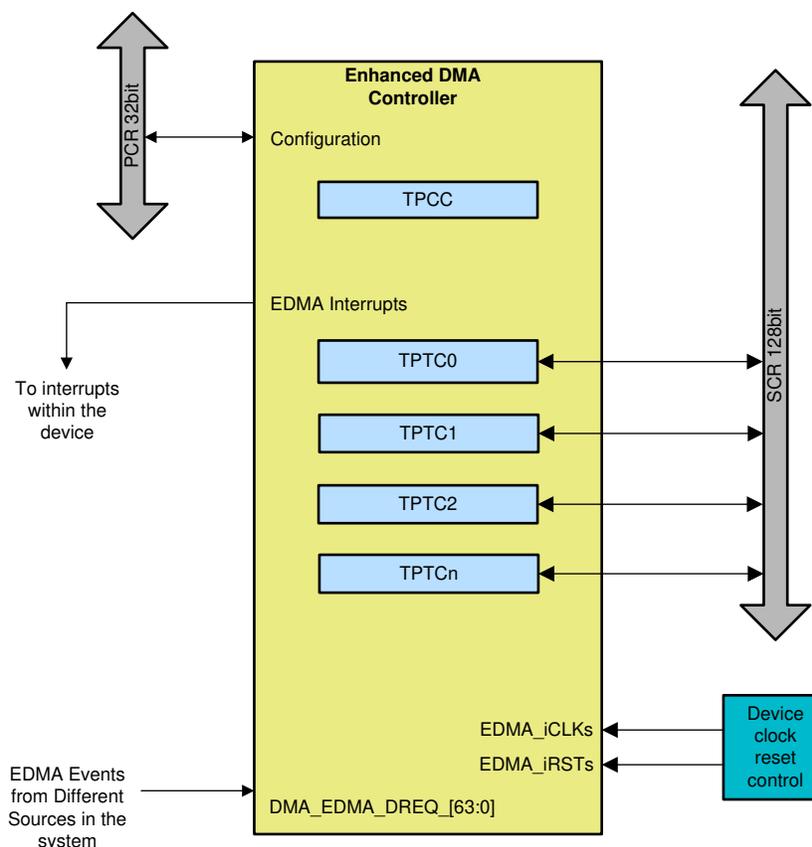

11.1 EDMA Module Overview

The enhanced direct memory access module, also called EDMA, performs high-performance data transfers between two target endpoints, memories and peripheral devices without microprocessor unit (MPU) or digital signal processor (DSP) support during transfer. EDMA transfer is programmed through a logical EDMA channel, which allows the transfer to be optimally tailored to the requirements of the application.

The EDMA controller is based on two major principal blocks:

- EDMA third-party channel controller (EDMA_TPCC)
- EDMA third-party transfer controller (EDMA_TPTC)

[Figure 11-1](#) shows an overview of the EDMA module.

Figure 11-1. EDMA Module Overview

For EDMA instances available on the device, see the device-specific integration section.

The **TPCC** is a high flexible channel controller that serves as both a user interface and an event interface for the EDMA controller. The EDMA_TPCC serves to prioritize incoming software requests or events from peripherals, and submits transfer requests (TRs) to the transfer controller.

The **TPTC** performs read and write transfers by EDMA ports to the target peripherals, as programmed in the Active and Pending set of the registers. The transfer controllers are responsible for data movement, and issue read/write commands to the source and destination addresses programmed for a given transfer in the EDMA_TPCC.

11.1.1 EDMA Features

This section shows generic EDMA features. For features applicable to the EDMA instances in the device, see the device-specific Integration section.

The EDMA_TPCC channel controller has the following features:

- Fully orthogonal transfer description:
 - Three transfer dimensions
 - A-synchronized transfers: one dimension serviced per event
 - AB-synchronized transfers: two dimensions serviced per event
 - Independent indexes on source and destination
 - Chaining feature allowing a 3-D transfer based on a single event.
- Flexible transfer definition:
 - Increment or FIFO transfer addressing modes
 - Linking mechanism allows automatic PaRAM set update
 - Chaining allows multiple transfers to execute with one event

- Interrupt generation for the following:
 - Transfer completion
 - Error conditions
- Debug visibility:
 - Queue water marking/threshold
 - Error and status recording to facilitate debug
- 64 DMA request channels:
 - Event synchronization
 - Manual synchronization (CPUs write to event set registers EDMA_TPCC_ESR and EDMA_TPCC_ESRH).
 - Chain synchronization (completion of one transfer triggers another transfer).
- Eight QDMA channels:
 - QDMA channels trigger automatically upon writing to a parameter RAM (PaRAM) set entry.
 - Support for programmable QDMA channel to PaRAM mapping.
- Each PaRAM set can be used for a DMA channel, QDMA channel, or link set.
- Multiple transfer controllers/event queues.
- 16 event entries per event queue.

The **EDMA_TPTC** transfer controller has the following features:

- 128-bit wide read and write ports per TC
- Supports two-dimensional transfers with independent indexes on source and destination (EDMA_TPCC manages the third dimension)
- Support for increment or constant addressing mode transfers
- Interrupt and error support
- Memory-Mapped Register (MMR) bit fields are fixed position in 32-bit MMR regardless of endianness

11.2 EDMA Integration

This section describes modules integration in the device, including information about clocks, resets, and hardware requests.

11.2.1 EDMA Integration

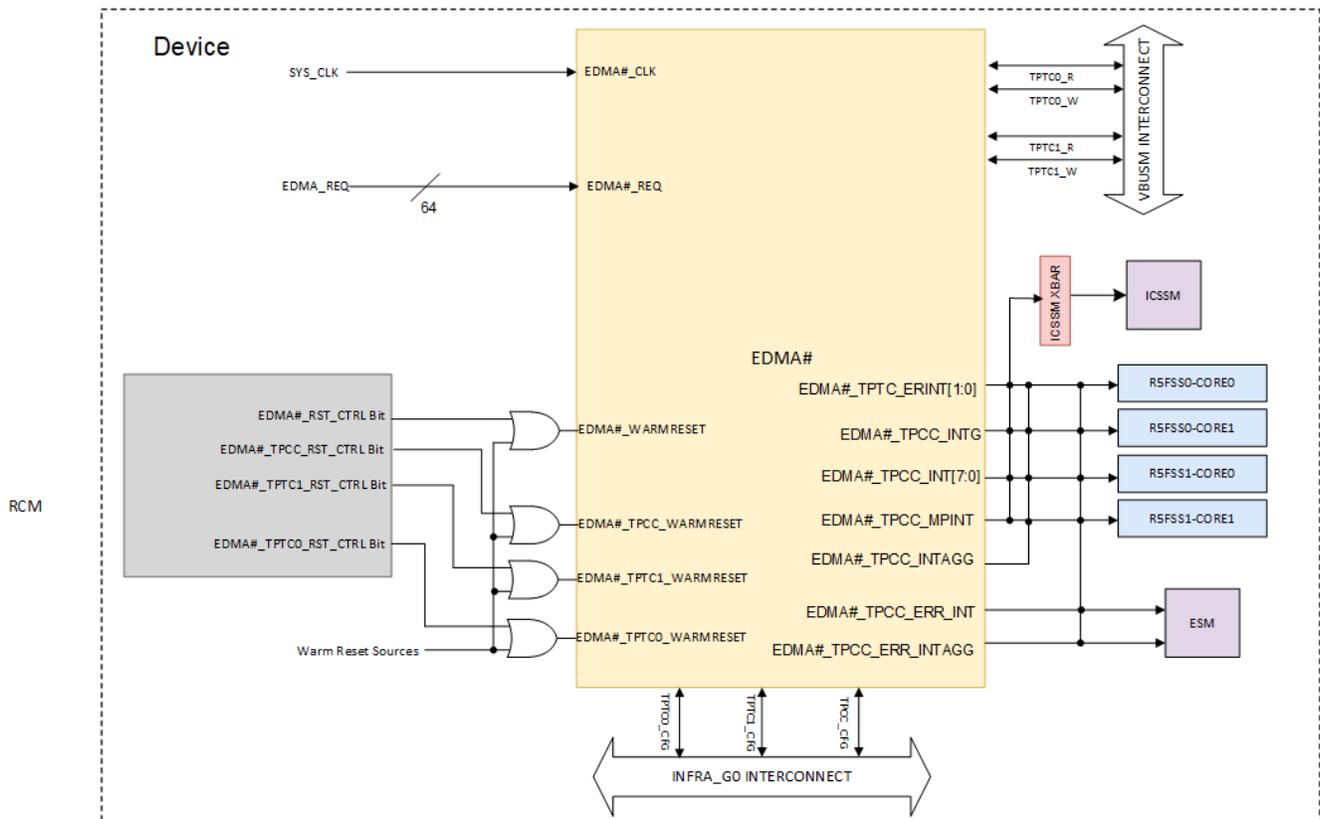

Figure 11-2. EDMA Integration Block Diagram

Note

For more information on the interconnects, see the [System Interconnect](#) chapter.

For more information on power, reset, and clock management, see the corresponding sections within the [Device Configuration](#) chapter.

For more information on the device interrupt controllers, see the [Interrupt Controllers](#) chapter.

11.2.2 EDMA Integration in MSS

The MSS has 2 TPCCs and 3 TPTCs, as shown in [Figure 11-3](#).

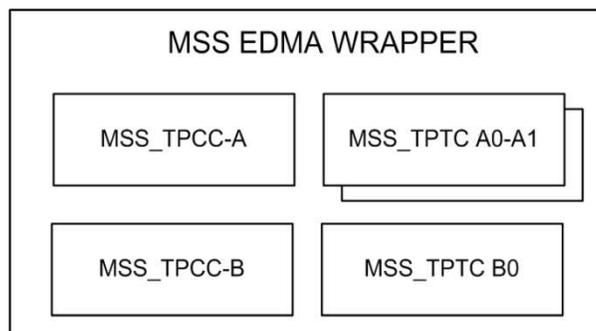

Figure 11-3. MSS EDMA Wrapper

Table 11-1 and Table 11-2 list the configuration for the TPCCs and TPTCs in the MSS.

Table 11-1. MSS TPCC Configuration

11.2.4 EDMA Functional Interrupt Aggregator

The following EDMA interrupts are aggregated and sent to the processor:

- TPCC Completion Interrupt
- TPCC Completion Region Interrupts
- TPTCs Completion Interrupt

Table 11-5 lists the associated interrupt and registers for each TPCC instance. This section refers to TPCC and TPTC related interrupts, so refer to EDMA XBAR INTRTR0 for EDMA XBAR interrupts.

Table 11-5. TPCC Interrupt Aggregators

TPCC	Interrupt	Registers Space
MSS_TPCC_A	MSS_TPCC_A_INTAGG	MSS_CTRL::MSS_TPCC_A_INTAGG_MASK MSS_CTRL::MSS_TPCC_A_INTAGG_STATUS MSS_CTRL::MSS_TPCC_A_INTAGG_STATUS_RAW
MSS_TPCC_B	MSS_TPCC_B_INTAGG	MSS_CTRL::MSS_TPCC_B_INTAGG_MASK MSS_CTRL::MSS_TPCC_B_INTAGG_STATUS MSS_CTRL::MSS_TPCC_B_INTAGG_STATUS_RAW
DSS_TPCC_A	DSS_TPCC_A_INTAGG	DSS_CTRL::DSS_TPCC_A_INTAGG_MASK DSS_CTRL::DSS_TPCC_A_INTAGG_STATUS DSS_CTRL::DSS_TPCC_A_INTAGG_STATUS_RAW
DSS_TPCC_B	DSS_TPCC_B_INTAGG	DSS_CTRL::DSS_TPCC_B_INTAGG_MASK DSS_CTRL::DSS_TPCC_B_INTAGG_STATUS DSS_CTRL::DSS_TPCC_B_INTAGG_STATUS_RAW
DSS_TPCC_C	DSS_TPCC_C_INTAGG	DSS_CTRL::DSS_TPCC_C_INTAGG_MASK DSS_CTRL::DSS_TPCC_C_INTAGG_STATUS DSS_CTRL::DSS_TPCC_C_INTAGG_STATUS_RAW
RSS_TPCC_A	RSS_TPCC_A_INTAGG	RSS_CTRL::RSS_TPCC_A_INTAGG_MASK RSS_CTRL::RSS_TPCC_A_INTAGG_STATUS RSS_CTRL::RSS_TPCC_A_INTAGG_STATUS_RAW
RSS_TPCC_B	RSS_TPCC_B_INTAGG	RSS_CTRL::RSS_TPCC_B_INTAGG_MASK RSS_CTRL::RSS_TPCC_B_INTAGG_STATUS RSS_CTRL::RSS_TPCC_B_INTAGG_STATUS_RAW

Table 11-5. TPCC Interrupt Aggregators (continued)

TPCC	Interrupt	Registers Space
HSM_TPCC_A	HSM_TPCC_A_INTAGG	HSM_CTRL::HSM_TPCC_A_INTAGG_MASK HSM_CTRL::HSM_TPCC_A_INTAGG_STATUS HSM_CTRL::HSM_TPCC_A_INTAGG_STATUS_RAW

For an event to generate an interrupt to the processor, the corresponding bit field must be unmasked in TPCC_x_INTAGG_MASK.

An interrupt processor can read the TPCC_x_INTAGG_STATUS register to detect which event triggered the interrupt.

The interrupt can be cleared by writing 0x1 to the corresponding bit in TPCC_x_INTAGG_STATUS. The software must verify that all the aggregated interrupts are cleared so that the level interrupt is deserted before exiting the ISR. This makes sure that a new pulse interrupt is generated to the processor. Thus, after clearing software, the user can read the register to confirm a value of 0x0.

The register TPCC_x_INTAGG_STATUS_RAW is set on an event irrespective of the value in TPCC_x_INTAGG_MASK. This field can be cleared by writing 0x1 to the corresponding bit in TPCC_x_INTAGG_STATUS_RAW.

11.2.5 EDMA Error Interrupt Aggregator

The following interrupts are aggregated and sent to the processor:

- TPCC Error
- TPCC MPU Error
- TPTCs Error
- TPCC Read and Write Config Space Access error
- TPTCs Read and Write Config Space Access error

Table 11-6. TPCC Error Interrupt Aggregators

TPCC	Interrupt	Registers Space
MSS_TPCC_A	MSS_TPCC_A_ERRAGG	MSS_CTRL::MSS_TPCC_A_ERRAGG_MASK MSS_CTRL::MSS_TPCC_A_ERRAGG_STATUS MSS_CTRL::MSS_TPCC_A_ERRAGG_STATUS_RAW
MSS_TPCC_B	MSS_TPCC_B_ERRAGG	MSS_CTRL::MSS_TPCC_B_ERRAGG_MASK MSS_CTRL::MSS_TPCC_B_ERRAGG_STATUS MSS_CTRL::MSS_TPCC_B_ERRAGG_STATUS_RAW
DSS_TPCC_A	DSS_TPCC_A_ERRAGG	DSS_CTRL::DSS_TPCC_A_ERRAGG_MASK DSS_CTRL::DSS_TPCC_A_ERRAGG_STATUS DSS_CTRL::DSS_TPCC_A_ERRAGG_STATUS_RAW
DSS_TPCC_B	DSS_TPCC_B_ERRAGG	DSS_CTRL::DSS_TPCC_B_ERRAGG_MASK DSS_CTRL::DSS_TPCC_B_ERRAGG_STATUS DSS_CTRL::DSS_TPCC_B_ERRAGG_STATUS_RAW
DSS_TPCC_C	DSS_TPCC_C_ERRAGG	DSS_CTRL::DSS_TPCC_C_ERRAGG_MASK DSS_CTRL::DSS_TPCC_C_ERRAGG_STATUS DSS_CTRL::DSS_TPCC_C_ERRAGG_STATUS_RAW
RSS_TPCC_A	RSS_TPCC_A_ERRAGG	RSS_CTRL::RSS_TPCC_A_ERRAGG_MASK RSS_CTRL::RSS_TPCC_A_ERRAGG_STATUS RSS_CTRL::RSS_TPCC_A_ERRAGG_STATUS_RAW
HSM_TPCC_A	HSM_TPCC_A_ERRAGG	HSM_CTRL::HSM_TPCC_A_ERRAGG_MASK HSM_CTRL::HSM_TPCC_A_ERRAGG_STATUS HSM_CTRL::HSM_TPCC_A_ERRAGG_STATUS_RAW

For an event to generate an interrupt to the processor, the corresponding bit field must be unmasked in TPCC_x_ERRAGG_MASK.

An interrupt processor can read the TPCC_x_ERRAGG_STATUS register to detect which event triggered the interrupt.

The interrupt can be cleared by writing 0x1 to the corresponding bit in TPCC_x_ERRAGG_STATUS. The software must ensure that all the aggregated interrupts are cleared so that the level interrupt is deserted before exiting the ISR. Only then is it ensured that a new pulse interrupt is generated to the processor. Thus, after clearing the software, the user should read the register to confirm a value of 0x0.

The register TPCC_x_ERRAGG_STATUS_RAW is set on an event irrespective of the value in TPCC_x_ERRAGG_MASK. This field can be cleared by writing 0x1 to the corresponding bit in TPCC_x_ERRAGG_STATUS_RAW.

11.2.6 EDMA Configuration

- The MSS has 2 channel controllers: MSS_TPCC-A and MSS_TPCC-B. MSS_TPCC-A has two transfer controllers: MSS_TPTC-A0 and MSS_TPTC-A1. MSS_TPCC-B has one transfer controller MSS_TPTC-B0.
- The DSS has 3 channel controllers: DSS_TPCC-A, DSS_TPCC-B and DSS_TPCC-C. Each channel controller has 2 transfer controllers.
- RSS has 1 channel controller: RCSS_TPCC-A, it has two transfer controllers: RCSS_TPTC-A0 and RCSS_TPTC-A1.

Table 11-7. EDMA3 Channel Controller Configuration

Parameters	MSS_TPCC_A	MSS_TPCC_B	DSS_TPCC_A	DSS_TPCC_B	DSS_TPCC_C	RCSS_TPCC_A

11.3 EDMA Controller Functional Description

This chapter discusses the architecture of the EDMA controller. The description contained in this section is generic to the EDMA module, and not all features mentioned here are supported by the device. See the EDMA integration section of the device to determine the applicability of these features.

11.3.1 Block Diagram

Figure 11-5 shows the functional block diagram of the EDMA controller.

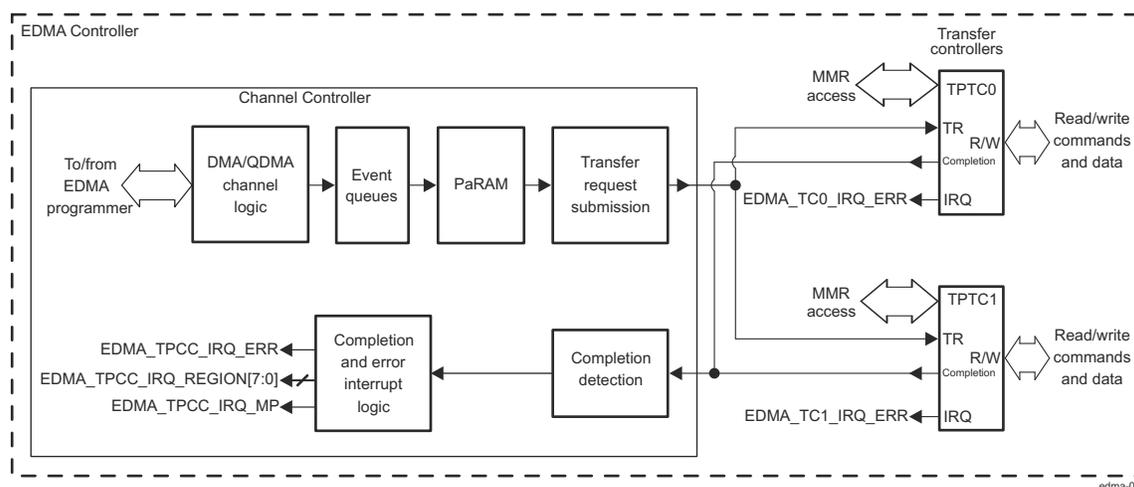

Figure 11-5. EDMA Controller Block Diagram

11.3.1.1 Third-Party Channel Controller

The TPCC is the EDMA transfer scheduler responsible for scheduling, arbitrating, and issuing user programmed transfers to the two TPTCs.

The functional block diagram below describes EDMA channel controller (EDMA_TPCC).

- A. Although the block is depicted twice in EDMA Channel Controller Block Diagram, there is only one physical register set for the QDMA to PaRAM set mapping block.

The main blocks of the EDMA_TPCC are as follows:

- **Parameter RAM (PaRAM):** The PaRAM maintains parameter sets for channel and reload parameter sets. The PaRAM must be written with the transfer context for the desired channels and link parameter sets. EDMA_TPCC processes and sets based on a trigger event and submits a transfer request (TR) to the transfer controllers.
- **EDMA event and interrupt processing registers:** Allows mapping of events to parameter sets, enable/disable events, enable/disable interrupt conditions, and clearing interrupts.
- **Completion detection:** The completion detect block detects completion of transfers by the EDMA_TPTCs or follower peripherals. The completion of transfers can be used optionally to chain trigger new transfers or to assert interrupts.
- **Event queues:** Event queues form the interface between the event detection logic and the transfer request submission logic.
- **Memory protection registers:** Memory protection registers define the accesses (privilege level and requestor(s)) that are allowed to access the DMA channel shadow region view(s) and regions of PaRAM.

Other functions include the following:

- **Region registers:** Region registers allow DMA resources (DMA channels and interrupts) to be assigned to unique regions that different EDMA programmers own (for example, DSPs).
- **Debug registers:** Debug registers allow debug visibility by providing registers to read the queue status, controller status, and missed event status.

The EDMA_TPCC includes two channel types: DMA channels (64 channels) and QDMA channels (8 channels). Each channel is associated with a given event queue/transfer controller and with a given PaRAM set. The main difference between a DMA channel and a QDMA channel is the method that the system uses to trigger transfers.

The EDMA_TPCC supports up to 64 DMA channels and up to 8 QDMA channels. These channels are identical, except for the triggers:

- DMA channels are triggered by external events by the event set registers EDMA_TPCC_ESR and EDMA_TPCC_ESRH, or through chaining register EDMA_TPCC_CER.
- QDMA channels are triggered automatically (auto-triggered) by the CPU. QDMAs allow a minimum number of linear writes to be issued to the TPCC to force a series of transfers to occur.

The TPCC arbitrates among pending DMA and QDMA events with a fixed [64:1] and [8:1] priority encoder for these events, respectively (a low channel number corresponds to a high priority).

DMA events are always higher priority than QDMA events. The higher-priority event is placed in the event queue to await submission to the transfer controllers, which occurs at the earliest opportunity. Each event queue is serviced in FIFO order, with a maximum of 16 queued events per event queue. If more than one TPTC is ready to be programmed with a transmission request (TR), the event queues are serviced with fixed priority: Q0 is higher than Q1. When an event is ready to be queued and the event queue and the TC channel are empty, the event bypasses the event queue and goes directly to the PaRAM processing logic for submission to the appropriate TC. If the transfer request TR bus or PaRAM processing are busy, the bypass path is not used. The bypass is not used to dequeue for a higher-priority event.

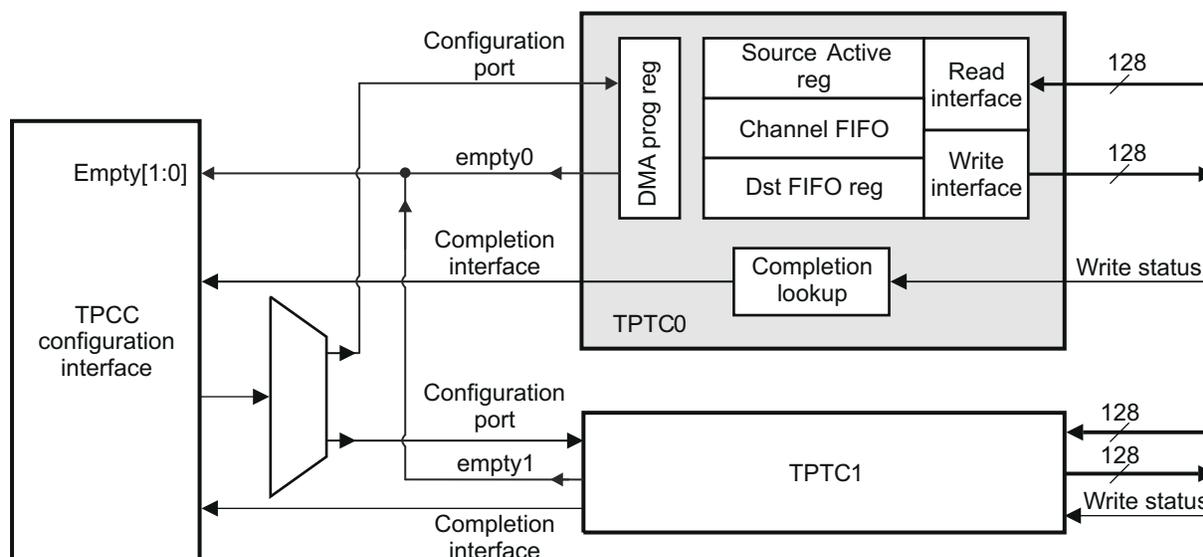

Events are extracted from the event queue when the EDMA_TPTC is available for a new TR to be programmed into the EDMA_TPTC (signaled with the empty signal, indicating an empty program register set). As an event is extracted from the event queue, the associated PaRAM entry is processed and submitted to the TPTC as a TR. The TPCC updates the appropriate counts and addresses in the PaRAM entry in anticipation of the next trigger event for that PaRAM entry.

The EDMA_TPCC also has an error detection logic that causes an error interrupt generation on various error conditions (for example: missed events EDMA_TPCC_EMR and EDMA_TPCC_EMRH registers, exceeding event queue thresholds in EDMA_TPCC_CCERR register, etc.).

11.3.1.2 Third-Party Transfer Controller

The TPTC module is the EDMA transfer engine that generates transfers as programmed in dedicated working registers, using two dedicated controller ports: a read-only port and a write-only port.

Figure 11-6 shows a functional block diagram and of the EDMA transfer controller (EDMA_TPTC) and its connection to the EDMA_TPCC.

Figure 11-6. TPTC Block Diagram
Note

The port data bus width of the instances of the TPTC is fixed at 128 bits.

Two instances of the EDMA_TPTC generate concurrent traffic on the L3_MAIN interconnect. Each TC controller consists of the following components:

- **DMA Program Register Set:** Stores the context for the DMA transfer that is loaded into the active register set when the current active register set completes. The CPU or TPCC programs the Program Register Set, not the active register set. For typical standalone operation, the CPU programs the Program Register while the TC services the Active register set. The Program Register set includes ownership control such that CPU software and the EDMA stay synchronized relative to one another.
- **Source Active Register Set :** Stores the context (src/dst/cnt/etc) for the DMA Transfer Request (TR) in progress in the Read Controller. The Active register set is split into independent Source and Destination, because the source interconnect controller and the distant interconnect controller operate independently of one another.
- **Destination FIFO Register Set:** Stores the context (src/dst/cnt/etc) for the DMA Transfer Request (TR) in progress, or pending, in the Write Controller. The pending register must allow the source controller to begin processing a new TR while the distant register set processes the previous TR.
- **Channel FIFO:** Temporary holding buffer for in-flight data. The read return data of the source peripheral is stored in the Data FIFO, and then is written to the destination peripheral by the write command/data bus.
- **Read Controller/Interconnect Read Interface:** The Interconnect read interface issues optimally sized read commands to the source peripheral, based on a burst size of 128 bytes and available landing space in the channel FIFO.
- **Write controller/Interconnect Write interface:** The local interconnect write interface issues optimally sized write commands to the destination peripheral, based on a burst size of 128 bytes and available data in the channel FIFO.
- **Completion interface:** sends completion codes to the EDMA_TPCC when a transfer completes and generates interrupts and chained events in the TPCC module.
- **Configuration port:** Target interface that provides read/write access to program registers and read access to all memory-mapped TPTC registers.

When one EDMA_TPTC module is idle and receive its first TR, DMA program register set receives the TR, where it transitions to the DMA source active set and the destination FIFO register set immediately. The second

TR (if pending from EDMA_TPCC) is loaded into the DMA program set, ensuring it can start as soon as possible when the active transfer completes. As soon as the current active set is exhausted, the TR is loaded from the DMA program register set into the DMA source active register set as well as to the appropriate entry in the destination FIFO register set.

The read controller issues read commands controlled by the rules of command fragmentation and optimization. These are issued only when the data FIFO has space available for the data read. When sufficient data is in the data FIFO, the write controller starts issuing a write command again following the rules for command fragmentation and optimization.

Depending on the number of entries, the read controller can process up to two or four transfer requests ahead of the destination subject to the amount of free data FIFO.

11.3.2 Types of EDMA controller Transfers

An EDMA transfer is always defined in terms of three dimensions. Figure 11-7 shows the three dimensions used by EDMA controller transfers. These three dimensions are defined as:

- 1st Dimension or Array (A): The 1st dimension in a transfer consists of EDMA_TPCC_ABCNT_n[15:0] ACNT contiguous bytes.
- 2nd Dimension or Frame (B): The 2nd dimension in a transfer consists of EDMA_TPCC_ABCNT_n[31:16] BCNT arrays of ACNT bytes. Each array transfer in the 2nd dimension is separated from each other by an index programmed using bit-fields EDMA_TPCC_BIDX_n[15:0] SBIDX or EDMA_TPCC_BIDX_n[31:16] DBIDX.
- 3rd Dimension or Block (C): The 3rd dimension in a transfer consists of CCNT frames of BCNT arrays of ACNT bytes. The Count for 3rd Dimension is defined in register EDMA_TPCC_CCNT_n[15:0] CCNT. Each transfer in the 3rd dimension is separated from the previous by an index programmed using EDMA_TPCC_CIDX_n[15:0] SCIDX or EDMA_TPCC_CIDX_n[31:16] DCIDX.

Note

The reference point for the index depends on the synchronization type. The amount of data transferred upon receipt of a trigger/synchronization event is controlled by the synchronization types (EDMA_TPCC_OPT_n[2] SYNCDIM bit). For these three dimensions, only two synchronization types are supported: A-synchronized transfers and AB-synchronized transfers.

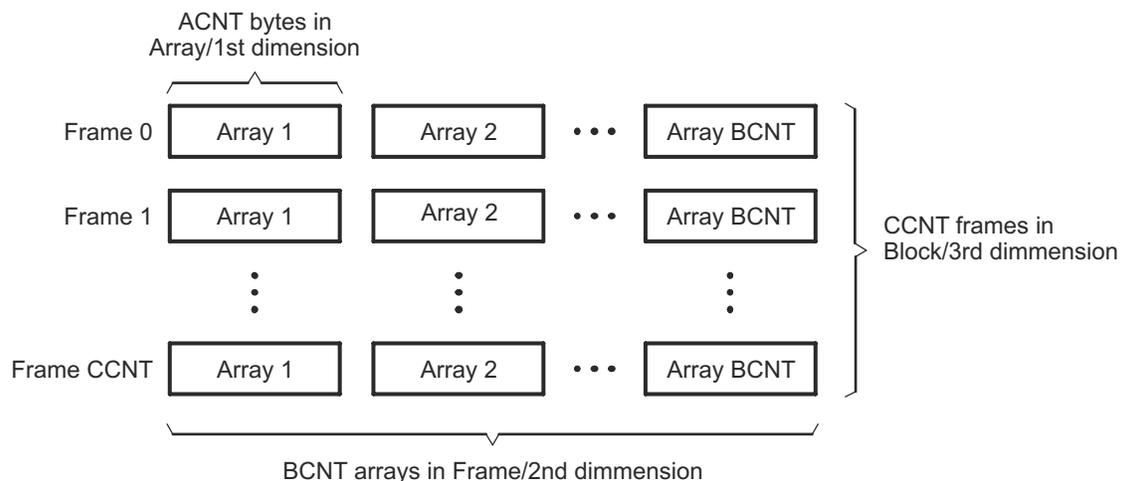

Figure 11-7. Definition of ACNT, BCNT, and CCNT

edma-007

11.3.2.1 A-Synchronized Transfers

In an A-synchronized transfer, each EDMA sync event initiates the transfer of the 1st dimension of EDMA_TPCC_ABCNT_n[15:0] ACNT bytes, or one array of ACNT bytes. Each event/TR packet conveys the transfer information for one array only. Thus, BCNT × CCNT events are needed to completely service a PaRAM set.

Arrays are always separated by EDMA_TPCC_BIDX_n[15:0] SBIDX and EDMA_TPCC_BIDX_n[31:16] DBIDX, as shown in Figure 11-8, where the start address of Array N is equal to the start address of Array N – 1 plus source (SRC) or destination (DST) in EDMA_TPCC_BIDX_n register.

Frames are always separated by EDMA_TPCC_CIDX_n[15:0] SCIDX and EDMA_TPCC_CIDX_n[31:16] DCIDX. For A-synchronized transfers, after the frame is exhausted, the address is updated by adding SRCCIDX/ DSTCIDX to the beginning address of the last array in the frame. As in Figure 11-8, SRCCIDX / DSTCIDX is the difference between the start of Frame 0 Array 3 to the start of Frame 1 Array 0.

Figure 11-8 shows an A-synchronized transfer of 3 (CCNT) frames of 4 (BCNT) arrays of n (ACNT) bytes. In this example, a total of 12 sync events (BCNT × CCNT) exhaust a PaRAM set. See Figure 11-8 for details on parameter set updates.

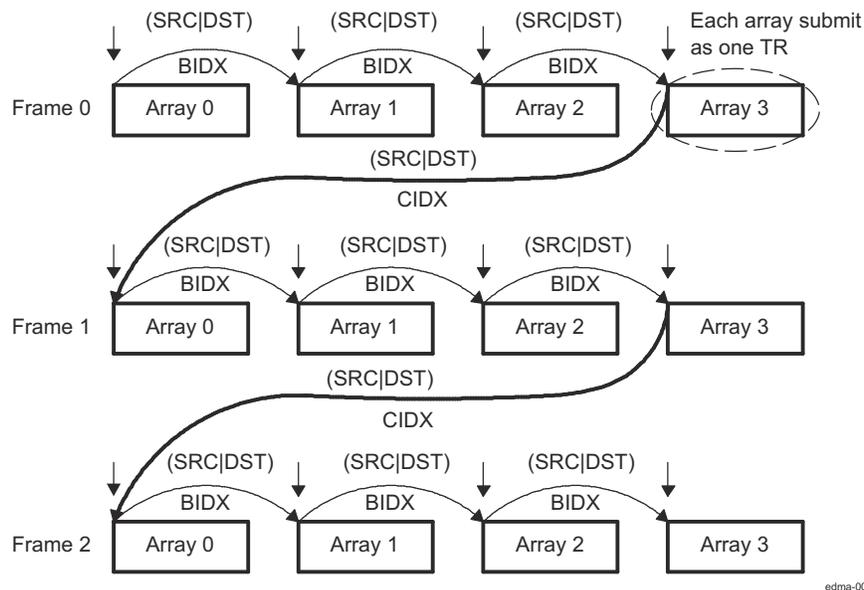

Figure 11-8. A-Synchronized Transfers (ACNT = n, BCNT = 4, CCNT = 3)

11.3.2.2 AB-Synchronized Transfers

In a AB-synchronized transfer, each EDMA sync event initiates the transfer of 2 dimensions or one frame. Each event/TR packet conveys information for one entire frame of BCNT_n arrays of ACNT_n bytes. Thus, EDMA_TPCC_CCNT_n events are needed to completely service a PaRAM set.

Arrays are always separated by EDMA_TPCC_BIDX_n[15:0] SBIDX and EDMA_TPCC_BIDX_n[31:16] DBIDX as shown in Figure 11-9. Frames are always separated by SRCCIDX and DSTCIDX.

Note that for AB-synchronized transfers, after a TR for the frame is submitted, the address update is to add EDMA_TPCC_CIDX_n[15:0] SCIDX / EDMA_TPCC_CIDX_n[31:16] DCIDX to the beginning address of the beginning array in the frame. This is different from A-synchronized transfers where the address is updated by adding SRCCIDX/DSTCIDX to the start address of the last array in the frame. See Section 11.3.3.6 Parameter Set Updates for details on parameter set updates.

Figure 11-9 shows an AB-synchronized transfer of 3 (CCNT) frames of 4 (BCNT) arrays of n (ACNT) bytes. In this example, a total of 3 sync events (CCNT) exhaust a PaRAM set; that is, a total of 3 transfers of 4 arrays each completes the transfer.

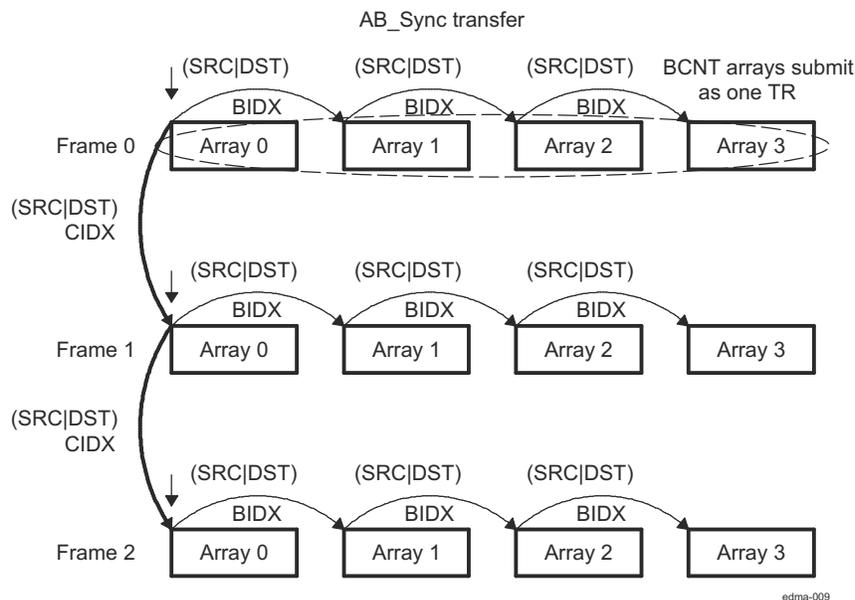

Figure 11-9. AB-Synchronized Transfers (ACNT = n, BCNT = 4, CCNT = 3)

Note

ABC-synchronized transfers are not directly supported. It can be logically achieved by chaining between multiple AB-synchronized transfers.

11.3.3 Parameter RAM (PaRAM)

The EDMA controller is a RAM-based architecture. The transfer context (source/destination addresses, count, indexes, etc.) for DMA or QDMA channels is programmed in a parameter RAM table in EDMA_TPCC. The PaRAM table is segmented into multiple PaRAM sets. Each PaRAM set includes eight four-byte PaRAM set entries (32-bytes total per PaRAM set), which includes typical DMA transfer parameters such as source address, destination address, transfer counts, indexes, options, etc.

The PaRAM structure supports flexible ping-pong, circular buffering, channel chaining, and auto-reloading (linking).

The contents of the PaRAM include the following:

- PaRAM sets
- 64 channels that are direct mapped and can be used as link or QDMA sets if not used for DMA channels
- 8 channels remain for link or QDMA sets

By default, all channels map to PaRAM set to 0 and should be remapped before use by EDMA_TPCC_DCHMAPN_m and EDMA_TPCC_QCHMAPN_j registers.

Table 11-11. EDMA Parameter RAM Contents

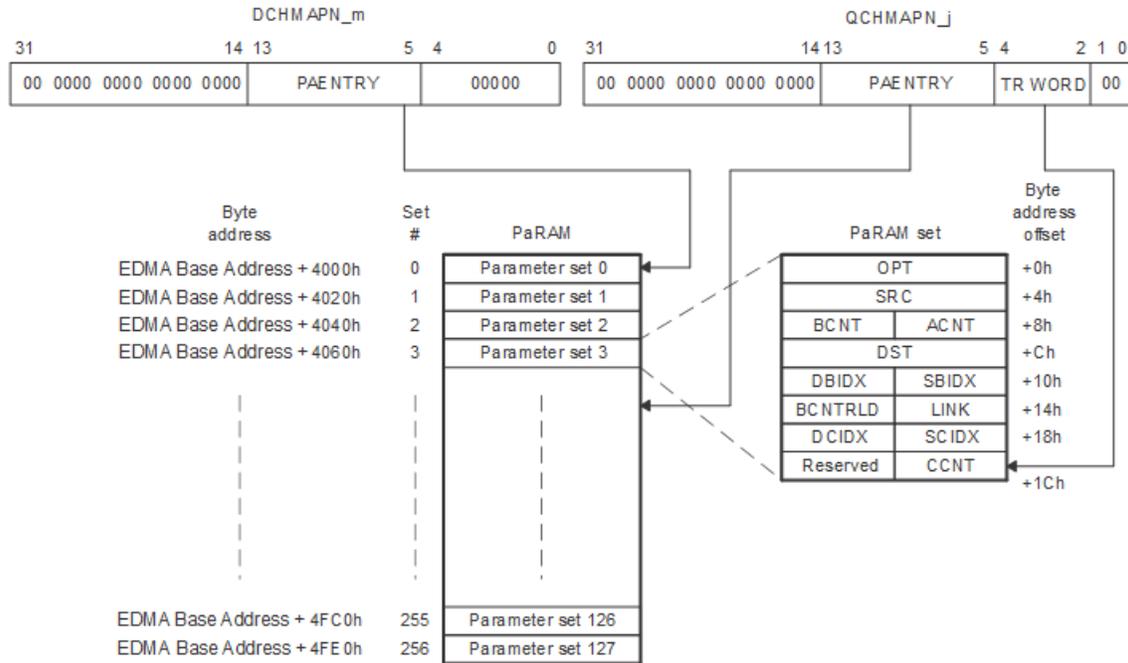

PaRAM Set Number	Base Address	Parameters ⁽¹⁾
0	EDMA Base Address + 4000h to EDMA Base Address + 401Fh	PaRAM set 0
1	EDMA Base Address + 4020h to EDMA Base Address + 403Fh	PaRAM set 1
2	EDMA Base Address + 4040h to EDMA Base Address + 405Fh	PaRAM set 2
3	EDMA Base Address + 4060h to EDMA Base Address + 407Fh	PaRAM set 3
4	EDMA Base Address + 4080h to EDMA Base Address + 409Fh	PaRAM set 4
5	EDMA Base Address + 40A0h to EDMA Base Address + 40BFh	PaRAM set 5
6	EDMA Base Address + 40C0h to EDMA Base Address + 40DFh	PaRAM set 6
7	EDMA Base Address + 40E0h to EDMA Base Address + 40FFh	PaRAM set 7
8	EDMA Base Address + 4100h to EDMA Base Address + 411Fh	PaRAM set 8
9	EDMA Base Address + 4120h to EDMA Base Address + 413Fh	PaRAM set 9
...
63	EDMA Base Address + 47E0h to EDMA Base Address + 47FFh	PaRAM set 63
64	EDMA Base Address + 4800h to EDMA Base Address + 481Fh	PaRAM set 64
65	EDMA Base Address + 4820h to EDMA Base Address + 483Fh	PaRAM set 65
...
127	EDMA Base Address + 5000h to EDMA Base Address + 4FE0h	PaRAM set 127

(1) The device has 8 QDMA channels that can be mapped to any parameter set number from 0 to .

Note

11.3.3.1 PaRAM

Each parameter set of PaRAM is organized into eight 32-bit words or 32 bytes, as shown in [Figure 11-10](#) and described in [Table 11-12](#). Each PaRAM set consists of 16-bit and 32-bit parameters.

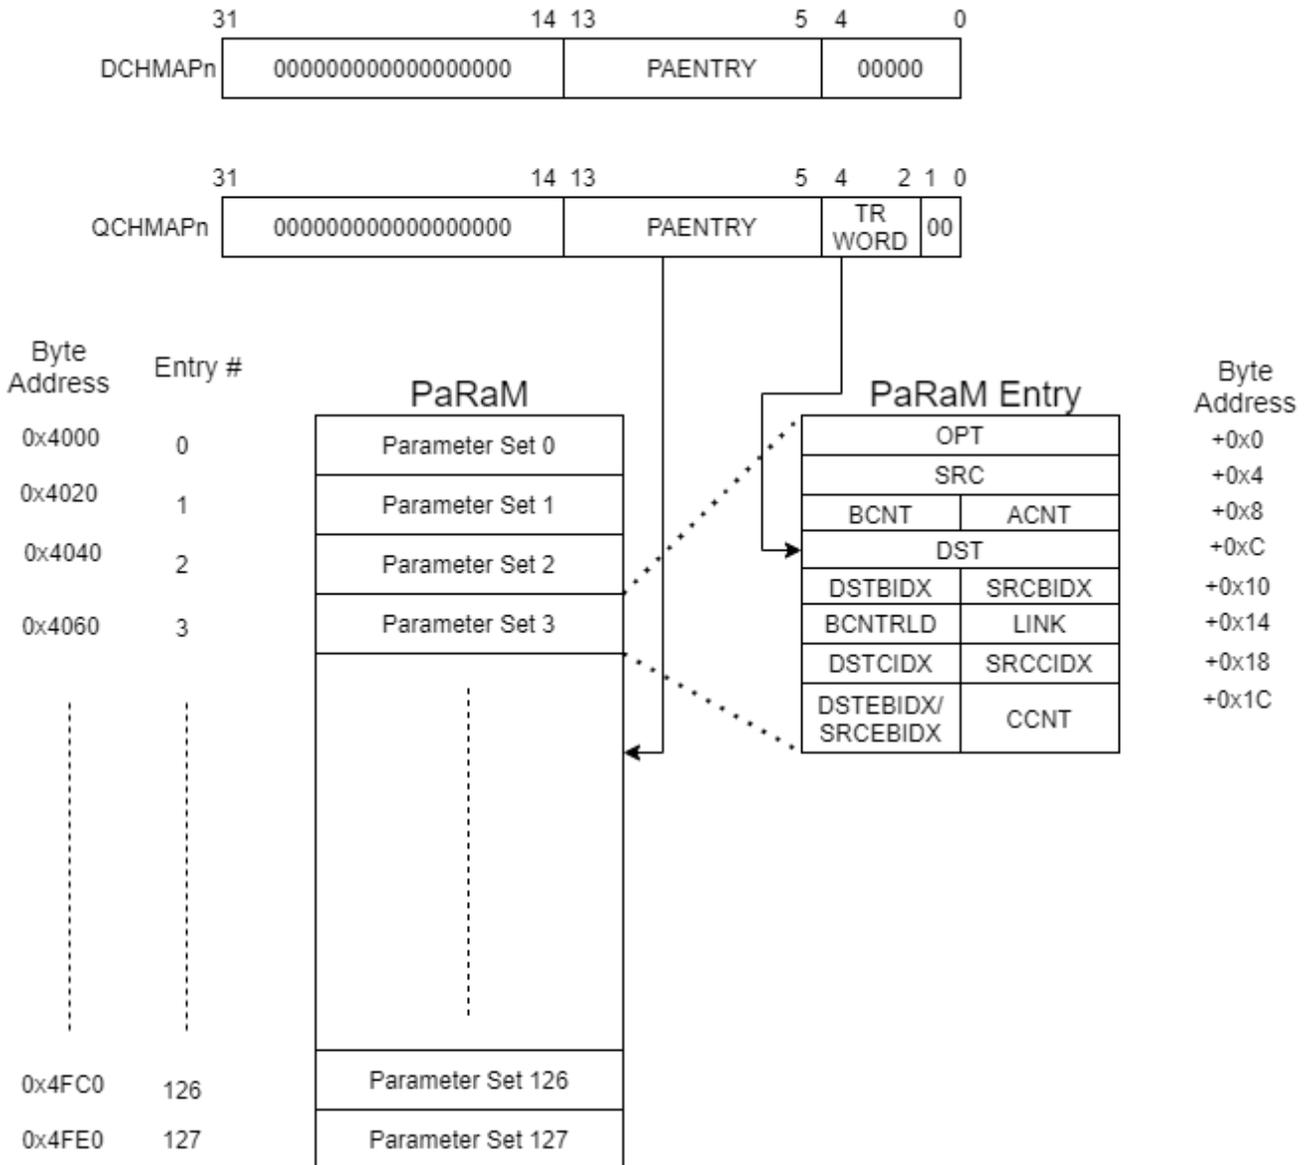

Figure 11-10. PaRAM Set

Note

Figure above is a representation of 128 bit entries. For device specific details please refer to [EDMA Configuration](#) chapter.

Table 11-12. EDMA Channel Parameter Description

Offset Address (bytes)	Acronym	Parameter	Description
0h	OPT	Channel Options EDMA_TPCC_OPT_n register	Transfer configuration options
4h	SRC	Channel Source Address EDMA_TPCC_SRC_n register	The byte address from which data is transferred
8h ⁽¹⁾	ACNT	Count for 1st Dimension EDMA_TPCC_ABCNT_n[15:0] ACNT bit-field.	Unsigned value specifying the number of contiguous bytes within an array (first dimension of the transfer). Valid values range from 1 to 65 535.
	BCNT	Count for 2nd Dimension EDMA_TPCC_ABCNT_n[31:16] BCNT bit-field.	Unsigned value specifying the number of arrays in a frame, where an array is ACNT bytes. Valid values range from 1 to 65 535.
Ch	DST	Channel Destination Address EDMA_TPCC_DST_n register	The byte address to which data is transferred
10h ⁽¹⁾	SBIDX	Source BCNT Index EDMA_TPCC_BIDX_n[15:0] SBIDX bit-field.	Signed value specifying the byte address offset between source arrays within a frame (2nd dimension). Valid values range from -32 768 and 32 767.
	DBIDX	Destination BCNT Index EDMA_TPCC_BIDX_n[31:16] DBIDX bit-field.	Signed value specifying the byte address offset between destination arrays within a frame (2nd dimension). Valid values range from -32 768 and 32 767.
14h ⁽¹⁾	LINK	Link Address EDMA_TPCC_LNK_n[15:0] LINK bit-field	The PaRAM address containing the PaRAM set to be linked (copied from) when the current PaRAM set is exhausted. A value of FFFFh specifies a null link.
	BCNTRLD	BCNT Reload EDMA_TPCC_LNK_n[31:16] BCNTRLD bit-field	The count value used to reload BCNT when BCNT decrements to 0 (TR is submitted for the last array in 2nd dimension). Only relevant in A-synchronized transfers.
18h ⁽¹⁾	SCIDX	Source CCNT index. EDMA_TPCC_CIDX_n[15:0] SCIDX bit-field.	Signed value specifying the byte address offset between frames within a block (3rd dimension). Valid values range from -32 768 and 32 767. A-synchronized transfers: The byte address offset from the beginning of the last source array in a frame to the beginning of the first source array in the next frame. AB-synchronized transfers: The byte address offset from the beginning of the first source array in a frame to the beginning of the first source array in the next frame.
	DCIDX	Destination CCNT index. EDMA_TPCC_CIDX_n[31:16] DCIDX bit-field.	Signed value specifying the byte address offset between frames within a block (3rd dimension). Valid values range from -32 768 and 32 767. A-synchronized transfers: The byte address offset from the beginning of the last destination array in a frame to the beginning of the first destination array in the next frame. AB-synchronized transfers: The byte address offset from the beginning of the first destination array in a frame to the beginning of the first destination array in the next frame.
1Ch	CCNT	Count for 3rd Dimension. EDMA_TPCC_CCNT_n[15:0] CCNT bit-field.	Unsigned value specifying the number of frames in a block, where a frame is BCNT arrays of ACNT bytes. Valid values range from 1 to 65 535.
	Reserved	Reserved	Reserved. Always write 0 to this bit; writes of 1 to this bit are not supported and attempts can result in undefined behavior.

- (1) If OPT, SRC, or DST is the trigger word for a QDMA transfer, then it is required to do a 32-bit access to that field. Furthermore, it is recommended to perform only 32-bit accesses on the parameter RAM for best code compatibility. For example, switching the endianness of the processor swaps addresses of the 16-bit fields, but 32-bit accesses avoid the issue entirely.

11.3.3.2 EDMA Channel PaRAM Set Entry Fields

11.3.3.2.1 Channel Options Parameter (OPT)

This is the control register for TPCC channel configuration options. Refer to the EDMA_TPCC_OPT_n register bitfield description for additional details.

11.3.3.2.2 Channel Source Address (SRC)

The 32-bit source address parameter specifies the starting byte address of the source. For SAM in increment mode, there are no alignment restrictions imposed by EDMA. For SAM in constant addressing mode, it must program the source address to be aligned to a 256-bit aligned address (5 LSBs of address must be 0). If this rule is not observed, the EDMA_TPTC returns an error. Refer to [Section 11.3.12.3 Error Generation](#) for additional details.

11.3.3.2.3 Channel Destination Address (DST)

The 32-bit destination address parameter specifies the starting byte address of the destination. For DAM in increment mode, there are no alignment restrictions imposed by EDMA. For DAM in constant addressing mode, it must program the destination address to be aligned to a 256-bit aligned address (5 LSBs of address must be 0). If this rule is not observed, the EDMA_TPTC returns an error. Refer to [Section 11.3.12.3 Error Generation](#) for additional details.

11.3.3.2.4 Count for 1st Dimension (ACNT)

EDMA_TPCC_ABCNT_n[15:0] ACNT represents the number of bytes within the 1st dimension of a transfer. ACNT is a 16-bit unsigned value with valid values between 0 and 65 535. Therefore, the maximum number of bytes in an array is 65 535 bytes (64K – 1 bytes). ACNT must be greater than or equal to 1 for a TR to be submitted to EDMA_TPTC. A transfer with ACNT equal to 0 is considered either a null or dummy transfer. A dummy or null transfer generates a completion code depending on the settings of the completion bit fields in EDMA_TPCC_OPT_n.

Refer to [Section 11.3.3.5 Dummy Versus Null Transfer Comparison](#) and [Section 11.3.5.3 Dummy or Null Completion](#) for details on dummy/null completion conditions.

11.3.3.2.5 Count for 2nd Dimension (BCNT)

EDMA_TPCC_ABCNT_n[15:0] BCNT is a 16-bit unsigned value that specifies the number of arrays of length ACNT. For normal operation, valid values for BCNT are between 1 and 65 535. Therefore, the maximum number of arrays in a frame is 65 535 (64K – 1 arrays). A transfer with BCNT equal to 0 is considered either a null or dummy transfer. A dummy or null transfer generates a completion code depending on the settings of the completion bit fields in EDMA_TPCC_OPT_n.

Refer to [Section 11.3.3.5 Dummy Versus Null Transfer Comparison](#) and [Section 11.3.5.3 Dummy or Null Completion](#) for details on dummy/null completion conditions.

11.3.3.2.6 Count for 3rd Dimension (CCNT)

EDMA_TPCC_CCNT_n[15:0] CCNT is a 16-bit unsigned value that specifies the number of frames in a block. Valid values for CCNT are between 1 and 65 535. Therefore, the maximum number of frames in a block is 65 535 (64K – 1 frames). A transfer with CCNT equal to 0 is considered either a null or dummy transfer. A dummy or null transfer generates a completion code depending on the settings of the completion bit fields in EDMA_TPCC_OPT_n.

A CCNT value of 0 is considered either a null or dummy transfer.

Refer to [Section 11.3.3.5 Dummy Versus Null Transfer Comparison](#) and [Section 11.3.5.3 Dummy or Null Completion](#) for details on dummy/null completion conditions.

11.3.3.2.7 BCNT Reload (BCNTRLD)

EDMA_TPCC_LNK_n[31:16] BCNTRLD is a 16-bit unsigned value used to reload the EDMA_TPCC_ABCNT_n[15:0] BCNT field once the last array in the 2nd dimension is transferred. This field is only used for A-synchronized transfers. In this case, the EDMA_TPCC decrements the BCNT value by 1 on

each TR submission. When BCNT reaches 0, the EDMA_TPCC decrements CCNT and uses the BCNTRLD value to reinitialize the BCNT value.

For AB-synchronized transfers, the EDMA_TPCC submits the BCNT in the TR and the EDMA_TPTC decrements BCNT appropriately. For AB-synchronized transfers, BCNTRLD is not used.

11.3.3.2.8 Source B Index (SBIDX)

EDMA_TPCC_BIDX_n[15:0] SBIDX is a 16-bit signed value (2s complement) used for source address modification between each array in the 2nd dimension. Valid values for EDMA_TPCC_BIDX_n[15:0] SBIDX are between $-32\,768$ and $32\,767$. It provides a byte address offset from the beginning of the source array to the beginning of the next source array. It applies to both A-synchronized and AB-synchronized transfers. Some examples:

- EDMA_TPCC_BIDX_n[15:0] SBIDX = 0000h (0): no address offset from the beginning of an array to the beginning of the next array. All arrays are fixed to the same beginning address.
- EDMA_TPCC_BIDX_n[15:0] SBIDX = 0003h (+3): the address offset from the beginning of an array to the beginning of the next array in a frame is 3 bytes. For example, if the current array begins at address 1000h, the next array begins at 1003h.
- EDMA_TPCC_BIDX_n[15:0] SBIDX = FFFFh (−1): the address offset from the beginning of an array to the beginning of the next array in a frame is -1 byte. For example, if the current array begins at address 5054h, the next array begins at 5053h.

11.3.3.2.9 Destination B Index (DBIDX)

EDMA_TPCC_BIDX_n[31:16] DBIDX is a 16-bit signed value (2s complement) used for destination address modification between each array in the 2nd dimension. Valid values for EDMA_TPCC_BIDX_n[31:16] DBIDX are between $-32\,768$ and $32\,767$. It provides a byte address offset from the beginning of the destination array to the beginning of the next destination array within the current frame. It applies to both A-synchronized and AB-synchronized transfers. Refer to [Section 11.3.3.2.8 Source B Index \(SBIDX\)](#) for examples.

11.3.3.2.10 Source C Index (SCIDX)

EDMA_TPCC_CIDX_n[15:0] SCIDX is a 16-bit signed value (2s complement) used for source address modification in the 3rd dimension. Valid values for EDMA_TPCC_CIDX_n[15:0] SCIDX are between $-32\,768$ and $32\,767$. It provides a byte address offset from the beginning of the current array (pointed to by SRC address) to the beginning of the first source array in the next frame. It applies to both A-synchronized and AB-synchronized transfers.

Note

When SCIDX is applied, the current array in an A-synchronized transfer is the last array in the frame ([Figure 11-8](#)), while the current array in an AB-synchronized transfer is the first array in the frame ([Figure 11-9](#)).

11.3.3.2.11 Destination C Index (DCIDX)

EDMA_TPCC_CIDX_n[31:16] DCIDX is a 16-bit signed value (2s complement) used for destination address modification in the 3rd dimension. Valid values are between $-32\,768$ and $32\,767$. It provides a byte address offset from the beginning of the current array (pointed to by DST address) to the beginning of the first destination array TR in the next frame. It applies to both A-synchronized and AB-synchronized transfers.

Note

When DCIDX is applied, the current array in an A-synchronized transfer is the last array in the frame ([Figure 11-8](#)), while the current array in a AB-synchronized transfer is the first array in the frame ([Figure 11-9](#)).

11.3.3.2.12 Link Address (LINK)

The EDMA_TPCC provides a mechanism, called linking, to reload the current PaRAM set upon its natural termination (that is, after the count fields are decremented to 0) with a new PaRAM set. The 16-bit parameter EDMA_TPCC_LNK_n[15:0] LINK specifies the byte address offset in the PaRAM from which the EDMA_TPCC loads/reloads the next PaRAM set during linking.

It must program the link address to point to a valid aligned 32-byte PaRAM set. The 5 LSBs of the LINK field should be cleared to 0.

The EDMA_TPCC ignores the upper 2 bits of the LINK entry, allowing the flexibility of programming the link address as either an absolute/literal byte address or use the PaRAM-base-relative offset address. Therefore, if it use the literal address with a range from 4000h to 7FFFh, it will be treated as a PaRAM-base-relative value of 0000h to 3FFFh.

It should check that the programmed value in the EDMA_TPCC_LNK_n[15:0] LINK field is correctly, so that link update is requested from a PaRAM address that falls in the range of the available PaRAM addresses on the device.

Value of FFFFh in EDMA_TPCC_LNK_n[15:0] LINK bit-field is referred to as a NULL link that should cause the EDMA_TPCC to perform an internal write of 0 to all entries of the current PaRAM set, except for the EDMA_TPCC_LNK_n[15:0] LINK field is set to FFFFh. Also, see [Section 11.3.5 Completion of a DMA Transfer](#) for details on terminating a transfer.

11.3.3.3 Null PaRAM Set

A null PaRAM set is defined as a PaRAM set where all count fields (EDMA_TPCC_ABCNT_n[15:0] ACNT, EDMA_TPCC_ABCNT_n[31:16] BCNT, and EDMA_TPCC_CCNT_n[15:0] CCNT) are cleared to 0. If a PaRAM set associated with a channel is a NULL set, then when serviced by the EDMA_TPCC, the bit corresponding to the channel is set in the associated event missed register (EDMA_TPCC_EMR, EDMA_TPCC_EMRH, or EDMA_TPCC_QEMR). This bit remains set in the associated secondary event register (EDMA_TPCC_SER, EDMA_TPCC_SERH, or EDMA_TPCC_QSER).

This implies that any future events on the same channel are ignored by the EDMA_TPCC and it is required to clear the bit in EDMA_TPCC_SER, EDMA_TPCC_SERH, or EDMA_TPCC_QSER for the channel. This is considered an error condition, since events are not expected on a channel that is configured as a null transfer.

11.3.3.4 Dummy PaRAM Set

A dummy PaRAM set is defined as a PaRAM set where at least one of the count fields (EDMA_TPCC_ABCNT_n[15:0] ACNT, EDMA_TPCC_ABCNT_n[31:16] BCNT, or EDMA_TPCC_CCNT_n[15:0] CCNT) is cleared to 0 and at least one of the count fields is nonzero.

If a PaRAM set associated with a channel is a dummy set, then when serviced by the EDMA_TPCC, it will not set the bit corresponding to the channel (DMA/QDMA) in the event missed register (EDMA_TPCC_EMR, EDMA_TPCC_EMRH, or EDMA_TPCC_QEMR) and the secondary event register (EDMA_TPCC_SER, EDMA_TPCC_SERH, or EDMA_TPCC_QSER) bit gets cleared similar to a normal transfer. Future events on that channel are serviced. A dummy transfer is a legal transfer of 0 bytes.

11.3.3.5 Dummy Versus Null Transfer Comparison

There are some differences in the way the EDMA_TPCC logic treats a dummy versus a null transfer request. A null transfer request is an error condition, but a dummy transfer is a legal transfer of 0 bytes. A null transfer causes an error bit (E_n) in EDMA_TPCC_EMR to get set and the E_n bit in EDMA_TPCC_SER remains set, essentially preventing any further transfers on that channel without clearing the associated error registers.

[Table 11-13](#) summarizes the conditions and effects of null and dummy transfer requests.

Table 11-13. Dummy and Null Transfer Request

Feature	Null TR	Dummy TR
EDMA_TPCC_EMR / EDMA_TPCC_EMRH / EDMA_TPCC_QEMR is set	Yes	No
EDMA_TPCC_SER / EDMA_TPCC_SERH / EDMA_TPCC_QSER remains set	Yes	No

Table 11-13. Dummy and Null Transfer Request (continued)

Feature	Null TR	Dummy TR
Link update (STATIC = 0 in EDMA_TPCC_OPT_n)	Yes	Yes
EDMA_TPCC_QER is set	Yes	Yes
EDMA_TPCC_IPR / EDMA_TPCC_IPRH, EDMA_TPCC_CER / EDMA_TPCC_CERH is set using early completion	Yes	Yes

11.3.3.6 Parameter Set Updates

When a TR is submitted for a given DMA/QDMA channel and its corresponding PaPARAM set, the EDMA_TPCC is responsible for updating the PaPARAM set in anticipation of the next trigger event. For events that are not final, this includes address and count updates; for final events, this includes the link update.

The specific PaPARAM set entries that are updated depend on the channel's synchronization type (A-synchronized or AB-synchronized) and the current state of the PaPARAM set. A B-update refers to the decrementing of EDMA_TPCC_ABCNT_n[31:16] BCNT in the case of A-synchronized transfers after the submission of successive TRs. A C-update refers to the decrementing of CCNT in the case of A-synchronized transfers after BCNT TRs for EDMA_TPCC_ABCNT_n[15:0] ACNT byte transfers have submitted. For AB-synchronized transfers, a C-update refers to the decrementing of EDMA_TPCC_CCNT_n[15:0] CCNT after submission of every transfer request.

Refer to [Table 11-14](#) for details and conditions on the parameter updates. A link update occurs when the PaPARAM set is exhausted, as described in [Section 11.3.3.7 Linking Transfers](#).

After the TR is read from the PaPARAM (and is in process of being submitted to EDMA_TPTC), the following fields are updated if needed:

- A-synchronized: BCNT, CCNT, SRC, DST.
- AB-synchronized: CCNT, SRC, DST.

The following fields are not updated (except for during linking, where all fields are overwritten by the link PaPARAM set):

- A-synchronized: EDMA_TPCC_ABCNT_n[15:0] ACNT, EDMA_TPCC_LNK_n[31:16] BCNTRLD, EDMA_TPCC_BIDX_n[15:0] SBIDX, EDMA_TPCC_BIDX_n[31:16] DBIDX, EDMA_TPCC_CIDX_n[15:0] SCIDX, EDMA_TPCC_CIDX_n[31:16] DCIDX, EDMA_TPCC_OPT_n, EDMA_TPCC_LNK_n[15:0] LINK.
- AB-synchronized: EDMA_TPCC_ABCNT_n[15:0] ACNT, EDMA_TPCC_ABCNT_n[31:16] BCNT, EDMA_TPCC_LNK_n[31:16] BCNTRLD, EDMA_TPCC_BIDX_n[15:0] SBIDX, EDMA_TPCC_BIDX_n[31:16] DBIDX, EDMA_TPCC_CIDX_n[15:0] SCIDX, EDMA_TPCC_CIDX_n[31:16] DCIDX, EDMA_TPCC_OPT_n, EDMA_TPCC_LNK_n[15:0] LINK.

Note

PaPARAM updates only pertain to the information that is needed to properly submit the next transfer request to the EDMA_TPTC. Updates that occur while data is moved within a transfer request are tracked within the transfer controller, and is detailed in [Section 11.3.12 EDMA Transfer Controller \(EDMA_TPTC\)](#). For A-synchronized transfers, the EDMA_TPCC always submits a TRP for EDMA_TPCC_ABCNT_n[15:0] ACNT bytes (EDMA_TPCC_ABCNT_n[31:16] BCNT = 1 and EDMA_TPCC_CCNT_n[15:0] CCNT = 1). For AB-synchronized transfers, the EDMA_TPCC always submits a TRP for EDMA_TPCC_ABCNT_n[15:0] ACNT bytes of BCNT arrays (EDMA_TPCC_CCNT_n[15:0] CCNT = 1). The EDMA_TPTC is responsible for updating source and destination addresses within the array based on EDMA_TPCC_ABCNT_n[15:0] ACNT and EDMA_TPCC_OPT_n[10:8] FWID. For AB-synchronized transfers, the EDMA_TPTC is also responsible to update source and destination addresses between arrays based on EDMA_TPCC_BIDX_n[15:0] SBIDX and EDMA_TPCC_BIDX_n[31:16] DBIDX.

[Table 11-14](#) shows the details of parameter updates that occur within EDMA_TPCC for A-synchronized and AB-synchronized transfers.

Table 11-14. Parameter Updates in EDMA_TPCC (for Non-Null, Non-Dummy PaRAM Set)

Condition:	A-Synchronized Transfer			AB-Synchronized Transfer		
	B-Update	C-Update	Link Update	B-Update	C-Update	Link Update
	BCNT > 1	BCNT == 1 && CCNT > 1	BCNT == 1 && CCNT == 1	N/A	EDMA_TPCC_CCNT_n[15:0] CCNT > 1	EDMA_TPCC_CCNT_n[15:0] CCNT == 1

LINK	None	None	= Link.EDMA_TPCC_LNK_n[15:0] LINK	None	None	= Link.EDMA_TPCC_LNK_n[15:0] LINK
BCNTRLD	None	None	= Link.EDMA_TPCC_LNK_n[31:16] BCNTRLD	None	None	= Link.EDMA_TPCC_LNK_n[31:16] BCNTRLD
OPT ⁽¹⁾	None	None	= LINK.EDMA_TPCC_OPT_n	None	None	= LINK.EDMA_TPCC_OPT_n

(1) In all cases, no updates occur if EDMA_TPCC_OPT_n[3] STATIC == 1 for the current PaRAM set.

Note

The EDMA_TPCC includes no special hardware to detect when an indexed address update calculation overflows/underflows. The address update will wrap across boundaries as programmed by the user. It should ensure that no transfer is allowed to cross internal port boundaries between peripherals. A single TR must target a single source/destination slave endpoint.

11.3.3.7 Linking Transfers

The EDMA_TPCC provides a mechanism known as linking, which allows the entire PaRAM set to be reloaded from a location within the PaRAM memory map (for both DMA and QDMA channels). Linking is especially useful for maintaining ping-pong buffers, circular buffering, and repetitive/continuous transfers with no CPU intervention. Upon completion of a transfer, the current transfer parameters are reloaded with the parameter set pointed to by the 16-bit link address field of the current parameter set. Linking only occurs when the EDMA_TPCC_OPT_n[3] STATIC bit is cleared.

Note

It should always link a transfer (EDMA or QDMA) to another useful transfer. If it must terminate a transfer, then link the transfer to a NULL parameter set. Refer to [Section 11.3.3.3 Null PaRAM Set](#).

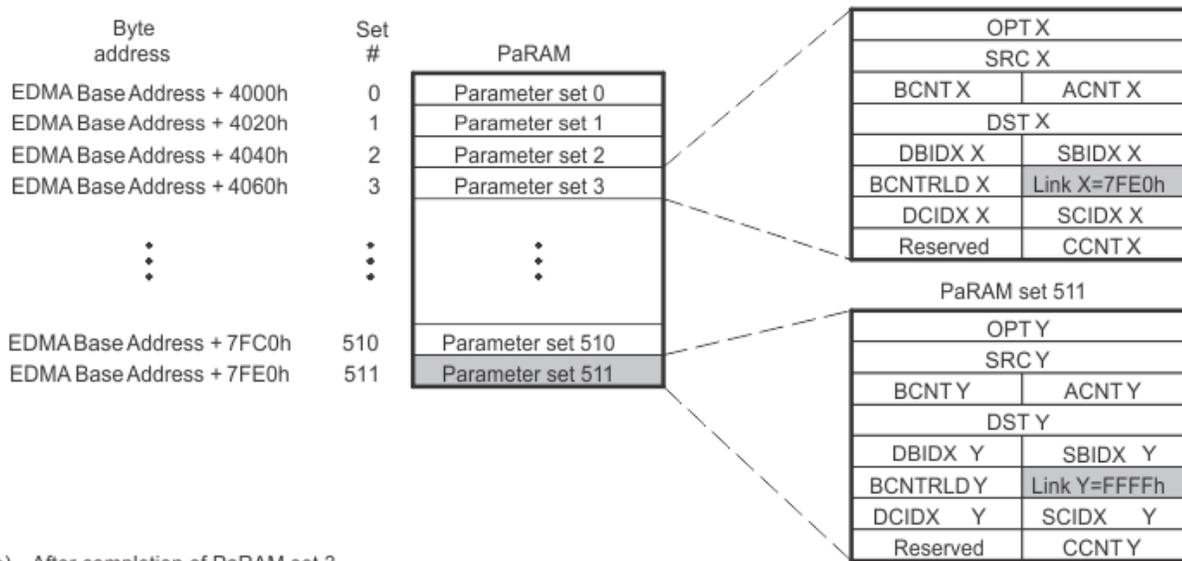

The link update occurs after the current PaRAM set event parameters have been exhausted. An event's parameters are exhausted when the EDMA channel controller has submitted all of the transfers that are associated with the PaRAM set.

A link update occurs for null and dummy transfers depending on the state of the EDMA_TPCC_OPT_n[3] STATIC bit and the EDMA_TPCC_LNK_n[15:0] LINK field. In both cases (null or dummy), if the value of EDMA_TPCC_LNK_n[15:0] LINK is FFFFh, then a null PaRAM set (with all 0s and EDMA_TPCC_LNK_n[15:0] LINK set to FFFFh) is written to the current PaRAM set.

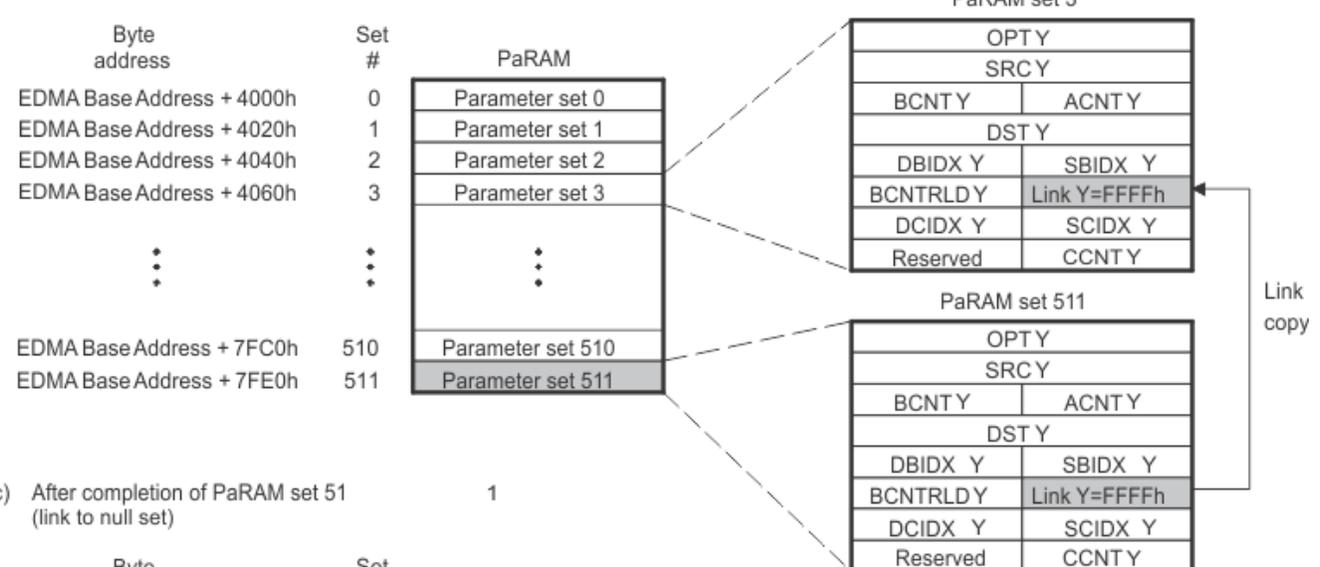

Similarly, if EDMA_TPCC_LNK_n[15:0] LINK is set to a value other than FFFFh, then the appropriate PaRAM location that EDMA_TPCC_LNK_n[15:0] LINK points to is copied to the current PaRAM set.

Once the channel completion conditions are met for an event, the transfer parameters that are located at the link address are loaded into the current DMA or QDMA channel's associated parameter set. This indicates that the EDMA_TPCC reads the entire set (eight words) from the PaRAM set specified by EDMA_TPCC_LNK_n[15:0] LINK and writes all eight words to the PaRAM set that is associated with the current channel. [Figure 11-11](#) shows an example of a linked transfer.

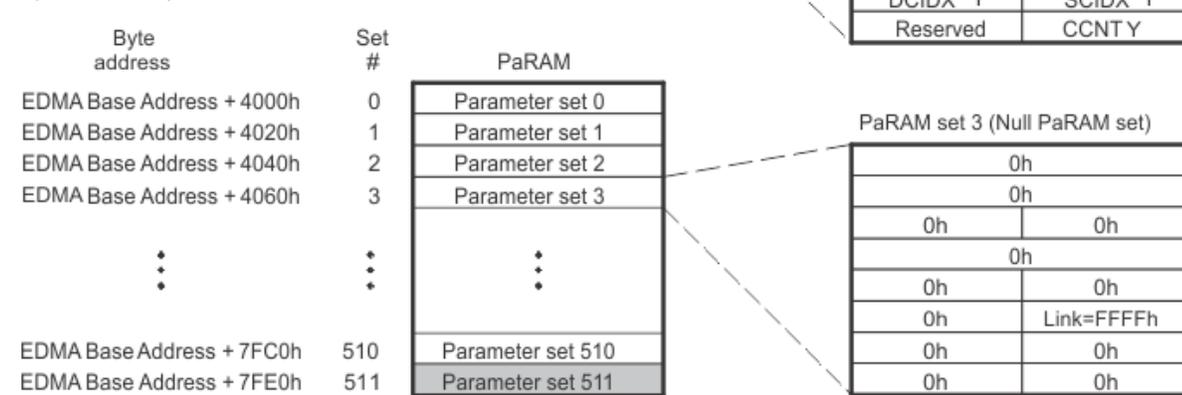

(a) At initialization

(b) After completion of PaRAM set 3 (link update)

(c) After completion of PaRAM set 51 (link to null set)

awr11a-011

Figure 11-11. Linked Transfer

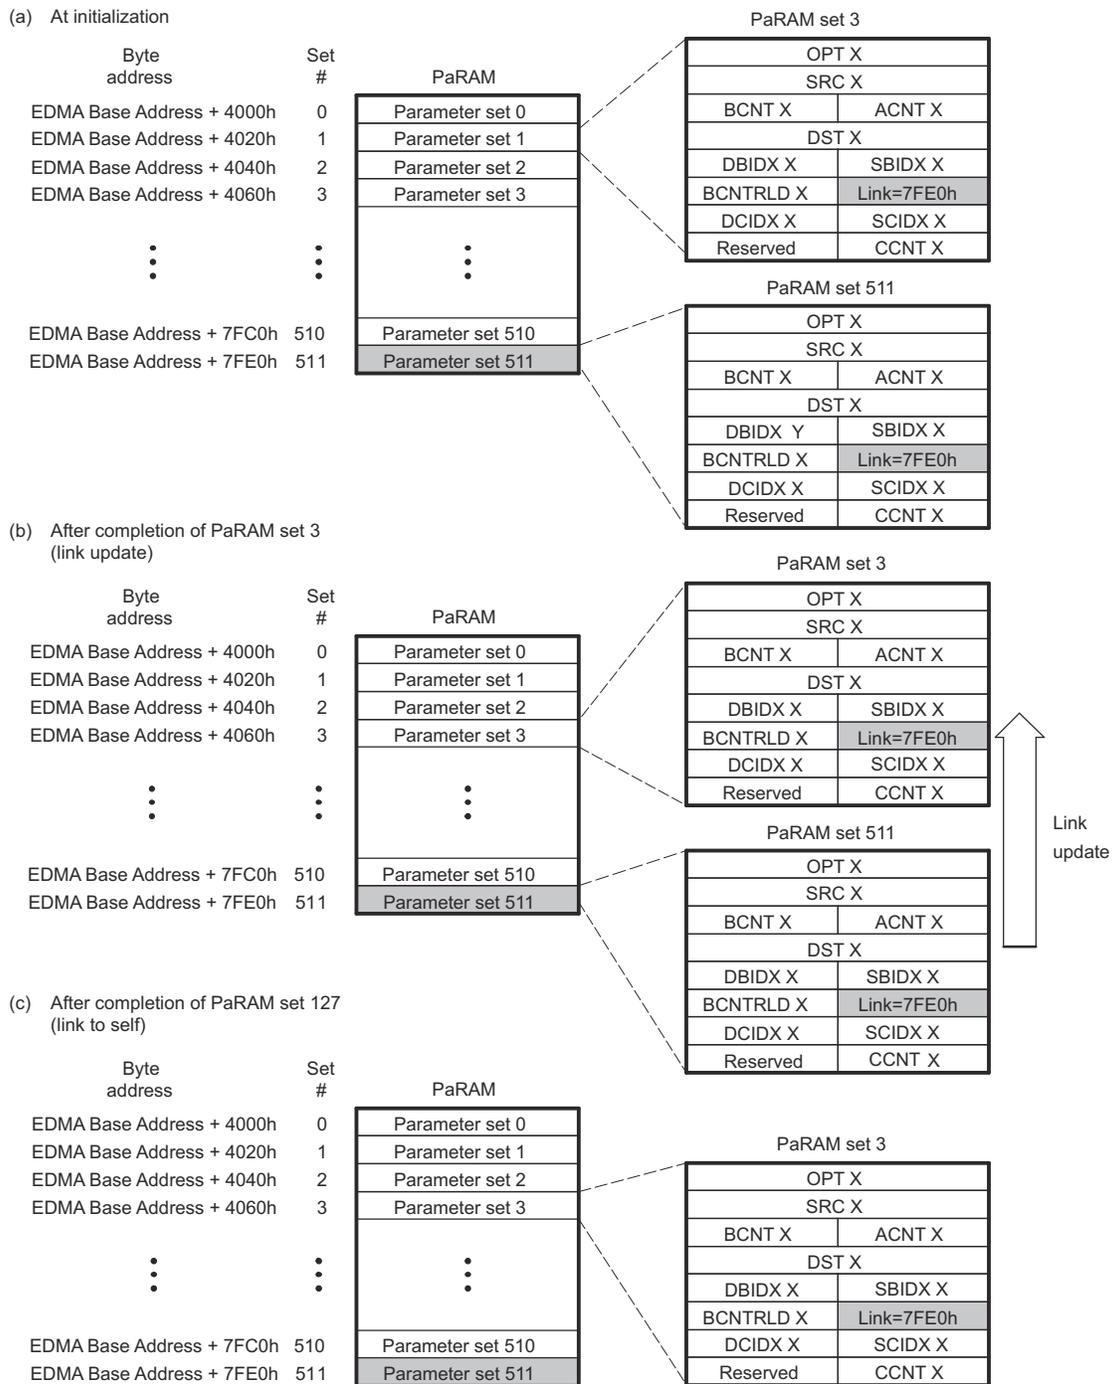

Note

AM273x has a maximum of 128 PaRAM sets. Additional tables and diagrams in this chapter may show a larger number (up to 511), however 128 is the maximum allowed number of entries.

Any PaRAM set in the PaRAM can be used as a link/reload parameter set. The PaRAM sets associated with peripheral synchronization events (refer to [Section 11.3.6 Event, Channel, and PaRAM Mapping](#)) only use for linking if the corresponding events are disabled.

If a PaRAM set location is defined as a QDMA channel PaRAM set (by EDMA_TPCC_QCHMAPN_j register), then copying the link PaRAM set into the current QDMA channel PaRAM set is recognized as a trigger event. It is latched in EDMA_TPCC_QER because a write to the trigger word was performed. This feature is used to create a linked list of transfers using a single QDMA channel and multiple PaRAM sets. Refer to [Section 11.3.4.2 QDMA Channels](#).

Linking to itself replicates the behavior of auto-initialization, thus facilitating the use of circular buffering and repetitive transfers. After an EDMA channel exhausts its current PaRAM set, it reloads all of the parameter set entries from another PaRAM set, which is initialized with values that are identical to the original PaRAM set. [Figure 11-12](#) shows an example of a linked to self transfer. Here, the PaRAM set 511 has the link field pointing to the address of parameter set 511 (linked to self).

edma-012

Figure 11-12. Link-to-Self Transfer

Note

If the in EDMA_TPCC_OPT_n[3] STATIC bit is set for a PaRAM set, then link updates are not performed.

11.3.3.8 Constant Addressing Mode Transfers/Alignment Issues

If either EDMA_TPCC_OPT_n[0] SAM or EDMA_TPCC_OPT_n[1] DAM is set (constant addressing mode), then the source or destination address must be aligned to a 256-bit aligned address, respectively, and the corresponding EDMA_TPCC_BIDX_n is an even multiple of 32 bytes (256 bits). The EDMA_TPCC does not recognize errors here, but the EDMA_TPTC asserts an error if this is not true. Refer to [Section 11.3.12.3 Error Generation](#).

Note

The constant addressing (CONST) mode has limited applicability. The EDMA is configured for the constant addressing mode (EDMA_TPCC_OPT_n[0] SAM / EDMA_TPCC_OPT_n[1] DAM = 1) only if the transfer source or destination (on-chip memory, off-chip memory controllers, slave peripherals) support the constant addressing mode. If the constant addressing mode is not supported, the similar logical transfer can be achieved using the increment (INCR) mode (EDMA_TPCC_OPT_n[0] SAM / EDMA_TPCC_OPT_n[1] DAM = 0) by appropriately programming the count and indices values.

11.3.3.9 Element Size

The EDMA controller does not use element-size and element-indexing. Instead, all transfers are defined in terms of all three dimensions: EDMA_TPCC_ABCNT_n[15:0] ACNT, EDMA_TPCC_ABCNT_n[31:16] BCNT, and EDMA_TPCC_CCNT_n[15:0] CCNT. An element-indexed transfer is logically achieved by programming EDMA_TPCC_ABCNT_n[15:0] ACNT to the size of the element and EDMA_TPCC_ABCNT_n[31:16] BCNT to the number of elements that need to be transferred. For example: If there are 16-bit audio data and 256 audio samples that must be transferred to a serial port, therefore the EDMA_TPCC_ABCNT_n[15:0] ACNT = 2 (2 bytes) and EDMA_TPCC_ABCNT_n[31:16] BCNT = 256.

11.3.4 Initiating a DMA Transfer

There are multiple ways to initiate a programmed data transfer using the EDMA_TPCC channel controller. Transfers on DMA channels are initiated by three sources.

They are listed as follows:

- **Event-triggered transfer request** (this is the typical usage of EDMA controller): A peripheral, system, or externally-generated event triggers a transfer request.
- **Manually-triggered transfer request:** The CPU manually triggers a transfer by writing a 1 to the corresponding bit in the event set registers (EDMA_TPCC_ESR / EDMA_TPCC_ESRH).
- **Chain-triggered transfer request:** A transfer is triggered on the completion of another transfer or sub-transfer.

Transfers on QDMA channels are initiated by two sources. They are as follows:

- **Auto-triggered transfer request:** Writing to the programmed trigger word triggers a transfer.
- **Link-triggered transfer requests:** Writing to the trigger word triggers the transfer when linking occurs.

11.3.4.1 DMA Channels

11.3.4.1.1 Event-Triggered Transfer Request

When an event is asserted from a peripheral or device pins, it gets latched in the corresponding bit of the event register (EDMA_TPCC_ER[31:0] $E_n = 1$). For more information about peripheral events to EDMA events mapping, refer to *the device data manual*.

If the corresponding event in the event enable register (EDMA_TPCC_EER) is enabled (EDMA_TPCC_EER[31:0] $E_n = 1$), then the EDMA_TPCC prioritizes and queues the event in the appropriate event queue. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

If the PaRAM set is valid (not a NULL set), then a transfer request packet (TRP) is submitted to the EDMA_TPTC and the EDMA_TPCC_ER[31:0] E_n bit is cleared. At this point, a new event can be safely received by the EDMA_TPCC.

If the PaRAM set associated with the channel is a NULL set (see [Section 11.3.3.3 Null PaRAM Set](#)), then no transfer request (TR) is submitted and the corresponding EDMA_TPCC_ER[31:0] En bit is cleared and simultaneously the corresponding channel bit is set in the event miss register (EDMA_TPCC_EMR[31:0] $En = 1$) to indicate that the event was discarded due to a null TR being serviced. Good programming practices should include cleaning the event missed error before re-triggering the DMA channel.

When an event is received, the corresponding event bit in the event register is set (EDMA_TPCC_ER[31:0] $En = 1$), regardless of the state of EDMA_TPCC_EER[31:0] En . If the event is disabled when an external event is received (EDMA_TPCC_ER[31:0] $En = 1$ and EDMA_TPCC_EER[31:0] $En = 0$), the EDMA_TPCC_ER[31:0] En bit remains set. If the event is subsequently enabled (EDMA_TPCC_EER[31:0] $En = 1$), then the pending event is processed by the EDMA_TPCC and the TR is processed/submitted, after which the EDMA_TPCC_ER[31:0] En bit is cleared.

If an event is being processed (prioritized or is in the event queue) and another sync event is received for the same channel prior to the original being cleared (EDMA_TPCC_ER[31:0] $En \neq 0$), then the second event is registered as a missed event in the corresponding bit of the event missed register (EDMA_TPCC_EMR[31:0] $En = 1$).

11.3.4.1.2 Manually-Triggered Transfer Request

The CPU or any peripheral device module initiates a DMA transfer by writing to the event set register EDMA_TPCC_ESR. Writing a 1 to an event bit in the EDMA_TPCC_ESR results in the event being prioritized/queued in the appropriate event queue, regardless of the state of the EDMA_TPCC_EER[31:0] En bit. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

As in the event-triggered transfers, if the PaRAM set associated with the channel is valid (it is not a null set) then the TR is submitted to the associated EDMA_TPTC and the channel can be triggered again.

If the PaRAM set associated with the channel is a NULL set (see [Section 11.3.3.3 Null PaRAM Set](#)), then no transfer request (TR) is submitted and the corresponding EDMA_TPCC_ER[31:0] En bit is cleared and simultaneously the corresponding channel bit is set in the event miss register EDMA_TPCC_EMR[31:0] $En = 1$ to indicate that the event was discarded due to a null TR being serviced. Good programming practices should include clearing the event missed error before re-triggering the DMA channel.

If an event is being processed (prioritized or is in the event queue) and the same channel is manually set by a write to the corresponding channel bit of the event set register EDMA_TPCC_ESR[31:0] $En = 1$ prior to the original being cleared EDMA_TPCC_ESR[31:0] $En = 0$, then the second event is registered as a missed event in the corresponding bit of the event missed register EDMA_TPCC_EMR[31:0] $En = 1$.

11.3.4.1.3 Chain-Triggered Transfer Request

Chaining is a mechanism by which the completion of one transfer automatically sets the event for another channel. When a chained completion code is detected, the value of which is dictated by the transfer completion code EDMA_TPCC_OPT_n[17:12] TCC of the PaRAM set associated with the channel, it results in the corresponding bit in the chained event register EDMA_TPCC_CER to be set EDMA_TPCC_CER[31:0] $E[TCC] = 1$).

Once a bit is set in EDMA_TPCC_CER, the EDMA_TPCC prioritizes and queues the event in the appropriate event queue. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

As in the event-triggered transfers, if the PaRAM set associated with the channel is valid (it is not a null set) then the TR is submitted to the associated EDMA_TPTC and the channel can be triggered again.

If the PaRAM set associated with the channel is a NULL set (see [Section 11.3.3.3 Null PaRAM Set](#)), then no transfer request (TR) is submitted and the corresponding EDMA_TPCC_CER[31:0] En bit is cleared and simultaneously the corresponding channel bit is set in the event miss register EDMA_TPCC_EMR[31:0] $En = 1$ to indicate that the event was discarded due to a null TR being serviced. In this case, the error condition must

be cleared before the DMA channel can be re-triggered. Good programming practices might include clearing the event missed error before re-triggering the DMA channel.

If a chaining event is being processed (prioritized or queued) and another chained event is received for the same channel prior to the original being cleared ($EDMA_TPCC_CER[31:0] En \neq 0$), then the second chained event is registered as a missed event in the corresponding channel bit of the event missed register $EDMA_TPCC_EMR[31:0] En = 1$.

Note

Chained event registers $EDMA_TPCC_CER$, event registers $EDMA_TPCC_ER$, and event set registers $EDMA_TPCC_ESR$ operate independently. An event En can be triggered by any of the trigger sources (event-triggered, manually-triggered, or chain-triggered).

11.3.4.2 QDMA Channels

11.3.4.2.1 Auto-Triggered and Link-Triggered Transfer Request

QDMA-based transfer requests are issued when a QDMA event gets latched in the QDMA event register $EDMA_TPCC_QER[31:0] En = 1$. A bit corresponding to a QDMA channel is set in the QDMA event register $EDMA_TPCC_QER$ when the following occurs:

- A CPU (or any device module) write occurs to a PaRAM address that is defined as a QDMA channel trigger word (programmed in the QDMA channel mapping register $EDMA_TPCC_QCHMAPN_j$ for the particular QDMA channel and the QDMA channel is enabled via the QDMA event enable register $EDMA_TPCC_QEER[31:0] En = 1$).
- $EDMA_TPCC$ performs a link update on a PaRAM set address that is configured as a QDMA channel matches $EDMA_TPCC_QCHMAPN_j$ settings and the corresponding channel is enabled via the QDMA event enable register $EDMA_TPCC_QEER[31:0] En = 1$.

Once a bit is set in $EDMA_TPCC_QER$, the $EDMA_TPCC$ prioritizes and queues the event in the appropriate event queue. When the event reaches the head of the queue, it is evaluated for submission as a transfer request to the transfer controller.

As in the event-triggered transfers, if the PaRAM set associated with the channel is valid (it is not a null set) then the TR is submitted to the associated $EDMA_TPTC$ and the channel can be triggered again.

If a bit is already set in $EDMA_TPCC_QER[31:0] En = 1$ and a second QDMA event for the same QDMA channel occurs prior to the original being cleared, the second QDMA event gets captured in the QDMA event miss register $EDMA_TPCC_QEMR[7:0] En = 1$.

11.3.4.3 Comparison Between DMA and QDMA Channels

The primary difference between DMA and QDMA channels is the event/channel synchronization.

QDMA events are either auto-triggered or link triggered. Auto-triggering allows QDMA channels to be triggered by CPU(s) with a minimum number of linear writes to PaRAM. Link triggering allows a linked list of transfers to be executed, using a single QDMA PaRAM set and multiple link PaRAM sets.

A QDMA transfer is triggered when a CPU (or other device modules) writes to the trigger word of the QDMA channel parameter set (auto-triggered) or when the $EDMA_TPCC$ performs a link update on a PaRAM set that has been mapped to a QDMA channel (link triggered).

Note

The CPUs triggered (manually triggered) DMA channels, in addition to writing to the PaRAM set, it is required to write to the event set register $EDMA_TPCC_ESR$ to kick-off the transfer.

QDMA channels are typically for cases where a single event accomplishes a complete transfer since the CPU (or other device modules) must reprogram some portion of the QDMA PaRAM set in order to re-trigger the channel. QDMA transfers are programmed with $EDMA_TPCC_ABCNT_n[31:0] BCNT = 1$ and

EDMA_TPCC_CCNT_n[15:0] CCNT = 1 for A-synchronized transfers, and EDMA_TPCC_CCNT_n[15:0] CCNT = 1 for AB-synchronized transfers.

Additionally, since linking is also supported (if EDMA_TPCC_OPT_n[3] STATIC = 0) for QDMA transfers, it allows to initiate a linked list of QDMAs, so when EDMA_TPCC copies over a link PaRAM set (including the write to the trigger word), the current PaRAM set mapped to the QDMA channel automatically recognizes as a valid QDMA event and initiate another set of transfers as specified by the linked set.

11.3.5 Completion of a DMA Transfer

A parameter set for a given channel is complete when the required number of transfer requests is submitted (based on receiving the number of synchronization events). The expected number of TRs for a non-null/non-dummy transfer is shown in [Table 11-15](#) for both synchronization types along with state of the PaRAM set prior to the final TR being submitted. When the counts (EDMA_TPCC_ABCNT_n[31:0] BCNT and/or EDMA_TPCC_CCNT_n[15:0] CCNT) are this value, the next TR results in:

- Final chaining or interrupt codes sent by the transfer controllers (instead of intermediate).
- Link updates (linking to either null or another valid link set).

Table 11-15. Expected Number of Transfers for Non-Null Transfer

Sync Mode	Counts at time 0	Total # Transfers	Counts prior to final TR
A-synchronized	ACNT BCNT CCNT	(BCNT × CCNT) TRs of ACNT bytes each	EDMA_TPCC_ABCNT_n[31:0] BCNT == 1 && EDMA_TPCC_CCNT_n[15:0] CCNT == 1
AB-synchronized	ACNT BCNT CCNT	CCNT TRs for ACNT × BCNT bytes each	EDMA_TPCC_CCNT_n[15:0] CCNT == 1

The PaRAM OPT field must program with a specific transfer completion code TCC or EDMA_TPCC_OPT_n[17:12] TCC along with the other EDMA_TPCC_OPT_n fields ([22] TCCHEN, [20] TCINTEN, [23] ITCCHEN, and [21] ITCINTEN bits) to indicate whether the completion code is to be used for generating a chained event or/and for generating an interrupt upon completion of a transfer.

The specific EDMA_TPCC_OPT_n[17:12] TCC value (6-bit binary value) programmed dictates which of the 64-bits in the chain event register EDMA_TPCC_CER [TCC] and/or interrupt pending register EDMA_TPCC_IPR [TCC] is set.

It can selectively program whether the transfer controller sends back completion codes on completion of the final transfer request (TR) of a parameter set EDMA_TPCC_OPT_n[22] TCCHEN or EDMA_TPCC_OPT_n[20] TCINTEN, for all but the final transfer request (TR) of a parameter set EDMA_TPCC_OPT_n[23] ITCCHEN or EDMA_TPCC_OPT_n[21] ITCINTEN), or for all TRs of a parameter set (both). Refer to [Section 11.3.8 Chaining EDMA Channels](#) for details on chaining (intermediate/final chaining) and [Section 11.3.9 EDMA Interrupts](#) for details on intermediate/final interrupt completion.

A completion detection interface exists between the EDMA channel controller and transfer controller(s). This interface sends back information from the transfer controller to the channel controller to indicate that a specific transfer is completed. Completion of a transfer is used for generating chained events and/or generating interrupts to the CPU(s).

All DMA/QDMA PaRAM sets must also specify a link address value. For repetitive transfers such as ping-pong buffers, the link address value must point to another predefined PaRAM set. Alternatively, a non-repetitive transfer must set the link address value to the null link value. The null link value is defined as FFFFh. Refer to [Section 11.3.3.7 Linking Transfers](#) for more details.

Note

Any incoming events that are mapped to a null PaRAM set results in an error condition. The error condition must clear before the corresponding channel is used again. Refer to [Section 11.3.3.5 Dummy Versus Null Transfer Comparison](#).

There are three ways the EDMA_TPCC gets updated/informed about a transfer completion: normal completion, early completion, and dummy/null completion. This applies to both chained events and completion interrupt generation.

11.3.5.1 Normal Completion

In normal completion mode EDMA_TPCC_OPT_n[11] TCCMODE = 0, the transfer or sub-transfer is considered to be complete when the EDMA channel controller receives the completion codes from the EDMA transfer controller. In this mode, the completion code to the channel controller is posted by the transfer controller after it receives a signal from the destination peripheral. Normal completion is typically used to generate an interrupt to inform the CPU that a set of data is ready for processing.

11.3.5.2 Early Completion

In early completion mode EDMA_TPCC_OPT_n[11] TCCMODE = 1, the transfer is considered to be complete when the EDMA channel controller submits the transfer request (TR) to the EDMA transfer controller. In this mode, the channel controller generates the completion code internally. Early completion is typically useful for chaining, as it allows subsequent transfers to be chained-triggered while the previous transfer is still in progress within the transfer controller, maximizing the overall throughput of the set of the transfers.

11.3.5.3 Dummy or Null Completion

This is a variation of early completion. Dummy or null completion is associated with a dummy set [Section 11.3.3.4](#) or null set [Section 11.3.3.3](#). In both cases, the EDMA channel controller does not submit the associated transfer request to the EDMA transfer controller(s). However, if the set (dummy/null) has the OPT field programmed to return completion code (intermediate/final interrupt/chaining completion), then it sets the appropriate bits in the interrupt pending registers EDMA_TPCC_IPR and EDMA_TPCC_IPRH or chained event register EDMA_TPCC_CER and EDMA_TPCC_CERH. The internal early completion path is used by the channel controller to return the completion codes internally (that is, EDMA_TPCC generates the completion code).

11.3.6 Event, Channel, and PaRAM Mapping

Several of the 64 DMA channels are tied to a specific hardware event, thus allowing events from device peripherals or external hardware (via the dma_evt[3:0] pins) to trigger transfers. A DMA channel typically requests a data transfer when it receives its event (apart from manually-triggered, chain-triggered, and other transfers). The amount of data transferred per synchronization event depends on the channel's configuration (EDMA_TPCC_ABCNT_n[15:0] ACNT, EDMA_TPCC_ABCNT_n[31:16] BCNT, EDMA_TPCC_CCNT_n[15:0] CCNT, etc.) and the synchronization type (A-synchronized or AB-synchronized).

The association of an event to a channel is fixed within the EDMA Channel Controller, that is, each DMA channel has one specific event associated with it.

In an application, if a channel does not use the associated synchronization event or if it does not have an associated synchronization event (unused), that channel can be used for manually-triggered or chained-triggered transfers, for linking/reloading, or as a QDMA channel.

11.3.6.1 DMA Channel to PaRAM Mapping

The mapping between the DMA channel numbers and the PaRAM sets is programmable (see [#unique_455](#)). The DMA channel mapping registers EDMA_TPCC_DCHMAPN_m in the EDMA_TPCC provide programmability that allows the DMA channels to be mapped to any of the PaRAM sets in the PaRAM memory map. [Figure 11-13](#) illustrates the use of EDMA_TPCC_DCHMAPN_m. There is one EDMA_TPCC_DCHMAPN_m register per channel.

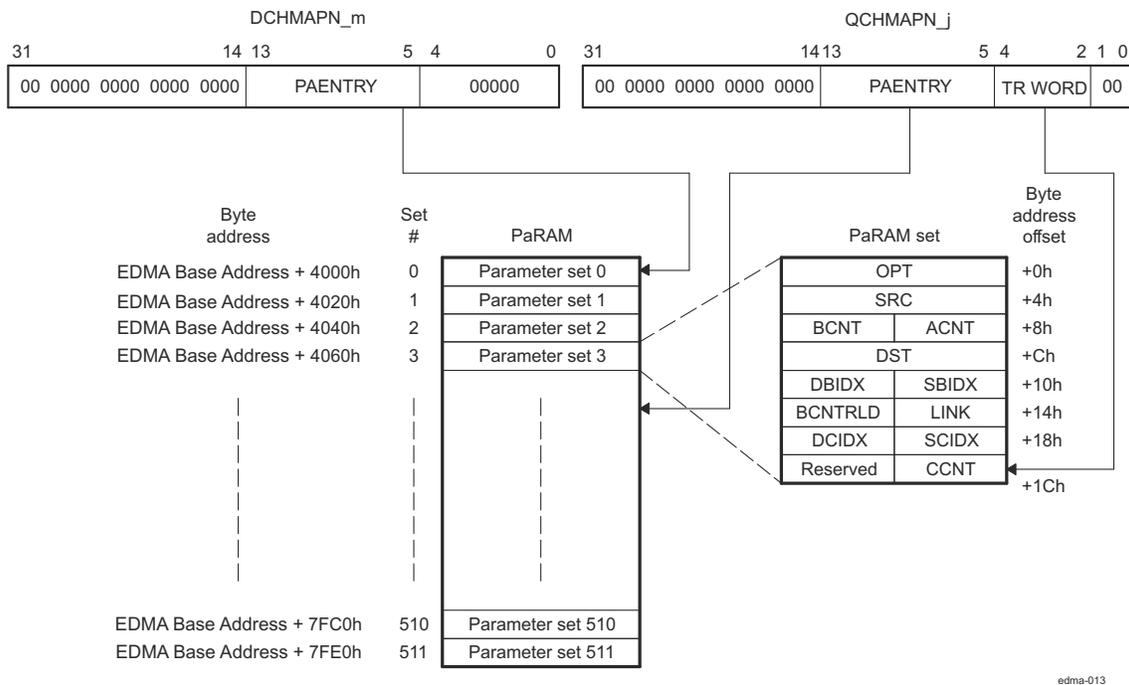

Figure 11-13. DMA Channel and QDMA Channel to PaRAM Mapping

Note

11.3.6.2 QDMA Channel to PaRAM Mapping

The mapping between the QDMA channels and the PaRAM sets is programmable. The QDMA channel mapping register `EDMA_TPCC_QCHMAPNj` in the `EDMA_TPCC` allows to map the QDMA channels to any of the PaRAM sets in the PaRAM memory map. [Figure 11-14](#) illustrates the use of `EDMA_TPCC_QCHMAPNj`.

`EDMA_TPCC_QCHMAPNj[4:2]` TRWORD bit-field allows to program the trigger word in the PaRAM set for the QDMA channel. A trigger word is one of the eight words in the PaRAM set. For a QDMA transfer to occur, a valid TR synchronization event for `EDMA_TPCC` is a write to the trigger word in the PaRAM set pointed to by `EDMA_TPCC_QCHMAPNj` for a particular QDMA channel. By default, QDMA channels are mapped to PaRAM set 0.

It must appropriately re-map PaRAM set 0 before use.

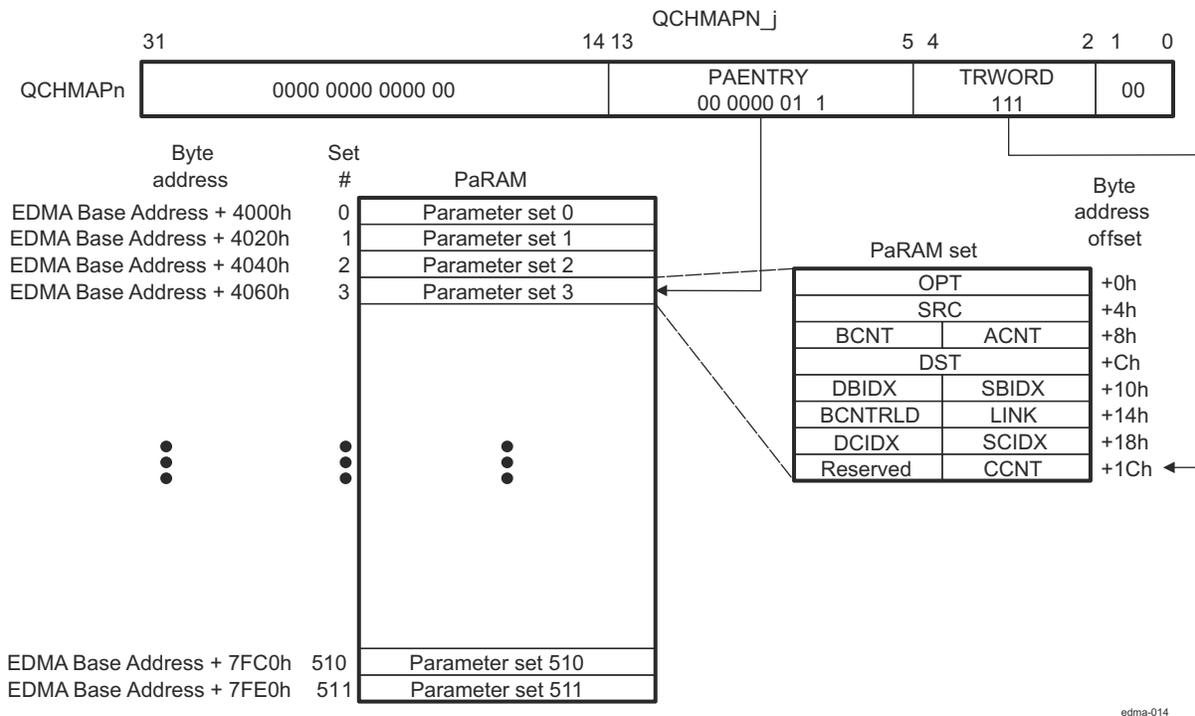

Figure 11-14. QDMA Channel to PaRAM Mapping

edma-014

11.3.7 EDMA Channel Controller Regions

The EDMA channel controller divides its address space into eight regions. Individual channel resources are assigned to a specific region, where each region is typically assigned to a specific device module uses the EDMA controller.

Application software can use regions or to ignore them altogether. It can be used active memory protection in conjunction with regions so that only a specific device module which uses the EDMA (for example, privilege identification) or privilege level (for example, user vs. supervisor) is allowed access to a given region, and thus to a given DMA or QDMA channel. This allows robust system-level DMA code where each EDMA initiator only modifies the state of the assigned resources. Memory protection is described in [Section 11.3.10 Memory Protection](#).

11.3.7.1 Region Overview

The EDMA channel controller memory-mapped registers are divided in three main categories:

1. Global registers
2. Global region channel registers
3. Shadow region channel registers

The global registers are located at a single/fixed location in the EDMA_TPCC memory map. These registers control EDMA resource mapping and provide debug visibility and error tracking information.

The channel registers (including DMA, QDMA, and interrupt registers) are accessible via the global channel region address range, or in the shadow *n* channel region address range(s). For example, the event enable register EDMA_TPCC_EER is visible at the global address of EDMA Base Address + 1020h or region addresses of EDMA Base Address + 2020h for region 0, EDMA Base Address + 2220h for region 1, ... EDMA Base Address + 2E20h for region 7.

The DMA region access enable registers EDMA_TPCC_DRAEM_k and the QDMA region access enable registers EDMA_TPCC_QRAEN_k control the underlying control register bits that are accessible via the shadow region address space (except for EDMA_TPCC_IEVAL and EDMA_TPCC_IEVAL_RN_k registers). [Table 11-16](#)

lists the registers in the shadow region memory map. Refer to *EDMA_TPCC register mapping summary* for the complete global and shadow region memory maps.

Table 11-16. Shadow Region Registers

EDMA_TPCC_DRAE M_k	EDMA_TPCC_DRAE HM_k	EDMA_TPCC_QRAE N_k

Figure 11-15 illustrates the conceptual view of the regions.

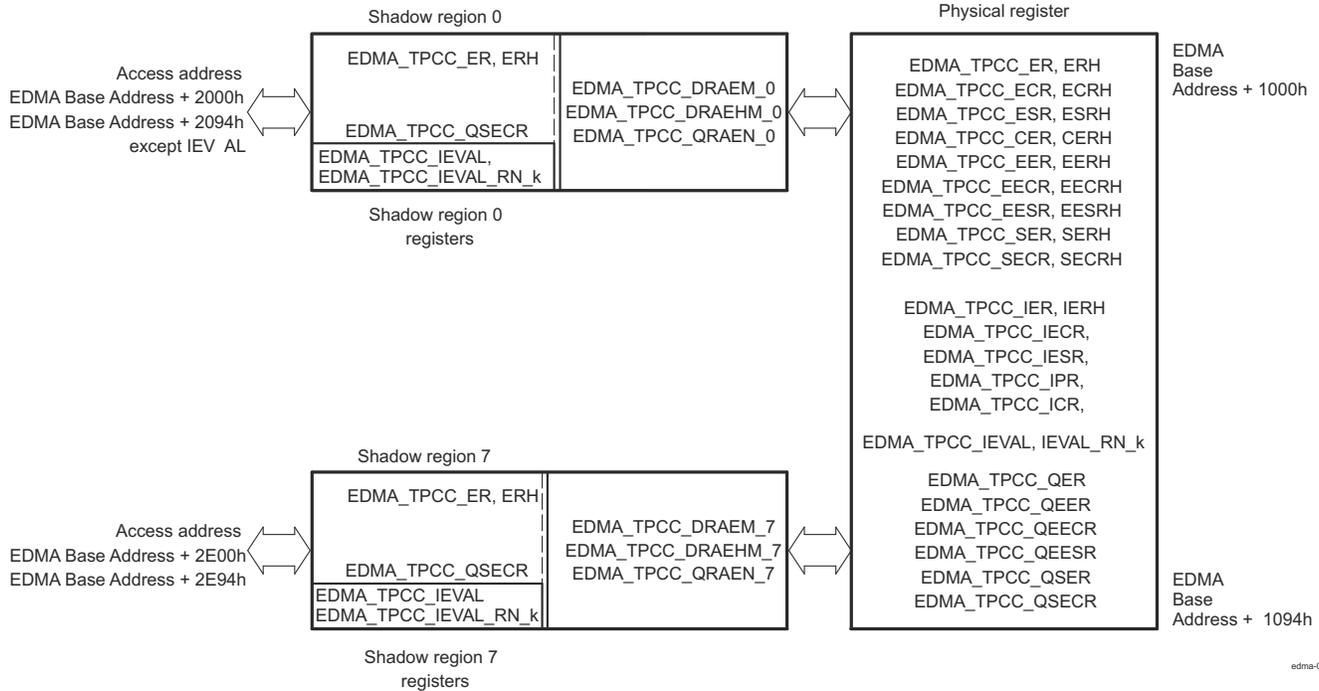

Figure 11-15. Shadow Region Registers

11.3.7.2 Channel Controller Regions

There are eight EDMA shadow regions (and associated memory maps). Associated with each shadow region are a set of registers defining which channels and interrupt completion codes belong to that region. These registers are user-programmed per region to assign ownership of the DMA/QDMA channels to a region.

- EDMA_TPCC_DRAEM_k and EDMA_TPCC_DRAEHM_k: One register pair exists for each of the shadow regions. The number of bits in each register pair matches the number of DMA channels (64 DMA channels). These registers need to be programmed to assign ownership of DMA channels and interrupt (or EDMA_TPCC_OPT_n[17:12] TCC codes) to the respective region. Accesses to DMA and interrupt registers via the shadow region address view are filtered through the DRAEM/DRAEHM pair. A value of 1 in the corresponding EDMA_TPCC_DRAEM_k[31:0] / EDMA_TPCC_DRAEHM_k[31:0] bit implies that the corresponding DMA interrupt channel is accessible; a value of 0 in the corresponding EDMA_TPCC_DRAEM_k[31:0] / EDMA_TPCC_DRAEHM_k[31:0] bit forces writes to be discarded and returns a value of 0 for reads.
- EDMA_TPCC_QRAEN_k: One register exists for every region. The number of bits in each register matches the number of QDMA channels (8 QDMA channels). These registers must be programmed to assign ownership of QDMA channels to the respective region. To enable a channel in a shadow region using shadow region 0 EDMA_TPCC_QEER, the corresponding bits in QRAE must be set or writing into EDMA_TPCC_QEESR there will be no the desired effect.
- EDMA_TPCC_MPPAN_k and EDMA_TPCC_MPPAG: One register exists for every region. This register defines the privilege level, requestor, and types of accesses allowed to a region's memory-mapped registers.

It is typical for an application to have a unique assignment of QDMA/DMA channels (and, therefore, a given bit position) to a given region.

The use of shadow regions allows restricted access to EDMA resources (DMA channels, QDMA channels, TCC, interrupts) by tasks in a system by setting or clearing bits in the EDMA_TPCC_DRAEM_k / EDMA_TPCC_QRAEN_k registers.

If exclusive access to any given channel / TCC code is required for a region, then only that region's EDMA_TPCC_DRAEM_k / EDMA_TPCC_QRAEN_k have the associated bit set.

Example 11-1. Resource Pool Division Across Two Regions

This example illustrates a resource pool division across two regions, assuming region 0 must be allocated 16 DMA channels (0-15) and 1 QDMA channel (0) and 32 TCC codes (0-15 and 48-63).

Region 1 needs to be allocated 16 DMA channels (16-32) and the remaining 7 QDMA channels (1-7) and TCC codes (16-47).

EDMA_TPCC_DRAEM_k should be equal to the OR of the bits that are required for the DMA channels and the TCC codes:

```
Region 0: DRAEHM, DRAEM = 0xFFFF0000, 0x0000FFFF QRAEN = 0x0000001
Region 1: DRAEHM, DRAEM = 0x0000FFFF, 0xFFFF0000 QRAEN = 0x00000FE
```

11.3.7.3 Region Interrupts

In addition to the EDMA_TPCC global completion interrupt, there is an additional completion interrupt line that is associated with every shadow region. Along with the interrupt enable register EDMA_TPCC_IER, DRAEM acts as a secondary interrupt enable for the respective shadow region interrupts. Refer to *Hardware Request* for more information about EDMA Interrupts.

11.3.8 Chaining EDMA Channels

The channel chaining capability for the EDMA allows the completion of an EDMA channel transfer to trigger another EDMA channel transfer. The purpose is to allow the ability to chain several events through one event occurrence.

Chaining is different from linking ([Section 11.3.3.7 Linking Transfers](#)). The EDMA link feature reloads the current channel parameter set with the linked parameter set. The EDMA chaining feature does not modify or update any channel parameter set. It provides a synchronization event to the chained channel (see [Section 11.3.4.1.3 Chain-Triggered Transfer Request](#)).

Chaining is achieved at either final transfer completion or intermediate transfer completion, or both, of the current channel. Consider a channel m (DMA/QDMA) required to chain to channel n . Channel number n (0-63) needs to be programmed into the EDMA_TPCC_OPT_n[17:12] TCC bit-field of channel m channel options parameter (OPT) set.

- If final transfer completion chaining EDMA_TPCC_OPT_n[22] TCCHEN = 1 is enabled, the chain-triggered event occurs after the submission of the last transfer request of channel m is either submitted or completed (depending on early or normal completion).

- If intermediate transfer completion chaining EDMA_TPCC_OPT_n[23] ITCCHEN = 1 is enabled, the chain-triggered event occurs after every transfer request, except the last of channel *m* is either submitted or completed (depending on early or normal completion).
- If both final and intermediate transfer completion chaining (EDMA_TPCC_OPT_n[22] TCCHEN = 1 and EDMA_TPCC_OPT_n[23] ITCCHEN = 1) are enabled, then the chain-trigger event occurs after every transfer request is submitted or completed (depending on early or normal completion).

Table 11-17 illustrates the number of chain event triggers occurring in different synchronized scenarios. Consider channel 31 programmed with EDMA_TPCC_ABCNT_n[15:0] ACNT = 3, EDMA_TPCC_ABCNT_n[31:16] BCNT = 4, EDMA_TPCC_CCNT_n[15:0] CCNT = 5, and EDMA_TPCC_OPT_n[17:12] TCC = 30.

Table 11-17. Chain Event Triggers

Options	(Number of chained event triggers on channel 30)	
	A-Synchronized	AB-Synchronized
EDMA_TPCC_OPT_n[22] TCCHEN = 1, EDMA_TPCC_OPT_n[23] ITCCHEN = 0	1 (Owing to the last TR)	1 (Owing to the last TR)
EDMA_TPCC_OPT_n[22] TCCHEN = 0, EDMA_TPCC_OPT_n[23] ITCCHEN = 1	19 (Owing to all but the last TR)	4 (Owing to all but the last TR)
EDMA_TPCC_OPT_n[22] TCCHEN = 1, EDMA_TPCC_OPT_n[23] ITCCHEN = 1	20 (Owing to a total of 20 TRs)	5 (Owing to a total of 5 TRs)

11.3.9 EDMA Interrupts

The EDMA interrupts are divided into 2 categories: transfer completion interrupts and error interrupts.

There are nine region interrupts, eight shadow regions and one global region. The transfer completion interrupts are listed in Table 11-18. The transfer completion interrupts and the error interrupts from the transfer controllers are all routed to the device interrupt controllers INTCs.

Table 11-18. EDMA Transfer Completion Interrupts

Name	Description
EDMA_TPCC_INT0	EDMA_TPCC Transfer Completion Interrupt Shadow Region 0
EDMA_TPCC_INT1	EDMA_TPCC Transfer Completion Interrupt Shadow Region 1
EDMA_TPCC_INT2	EDMA_TPCC Transfer Completion Interrupt Shadow Region 2
EDMA_TPCC_INT3	EDMA_TPCC Transfer Completion Interrupt Shadow Region 3
EDMA_TPCC_INT4	EDMA_TPCC Transfer Completion Interrupt Shadow Region 4
EDMA_TPCC_INT5	EDMA_TPCC Transfer Completion Interrupt Shadow Region 5
EDMA_TPCC_INT6	EDMA_TPCC Transfer Completion Interrupt Shadow Region 6
EDMA_TPCC_INT7	EDMA_TPCC Transfer Completion Interrupt Shadow Region 7

Table 11-19. EDMA Error Interrupts

Name	Description
EDMA_TPCC_ERRINT	EDMA_TPCC Error Interrupt
EDMA_TPCC_MPINT	EDMA_TPCC Memory Protection Interrupt
EDMA_TC0_ERRINT	TC0 Error Interrupt
EDMA_TC1_ERRINT	TC1 Error Interrupt

11.3.9.1 Transfer Completion Interrupts

The EDMA_TPCC is responsible for generating transfer completion interrupts to the CPU(s) (and other EDMA controllers). The EDMA generates a single completion interrupt per shadow region, as well as one for the global region on behalf of all 64 channels. The various control registers and bit fields facilitate EDMA interrupt generation.

The software architecture must either use the global interrupt or the shadow interrupts, but not both.

The transfer completion code EDMA_TPCC_OPT_n[17:12] TCC value is directly mapped to the bits of the interrupt pending register EDMA_TPCC_IPR / EDMA_TPCC_IPRH.

For example, if EDMA_TPCC_OPT_n[17:12] TCC = 10 0001b, EDMA_TPCC_IPRH[1] is set after transfer completion, and results in interrupt generation to the CPU(s) if the completion interrupt is enabled for the CPU. See [Section 11.3.9.1.1 Enabling Transfer Completion Interrupts](#) for details about enabling EDMA transfer completion interrupts.

When a completion code is returned (as a result of early or normal completions), the corresponding bit in EDMA_TPCC_IPR / EDMA_TPCC_IPRH registers is set if transfer completion interrupt (final/intermediate) is enabled in the channel options parameter (OPT) for a PaRAM set associated with the transfer.

Table 11-20. Transfer Complete Code (TCC) to EDMA_TPCC Interrupt Mapping

TCC values in EDMA_TPCC_OPT_n[17:12] TCC (EDMA_TPCC_OPT_n[20] TCINTEN / EDMA_TPCC_OPT_n[21] ITCINTEN = 1)	EDMA_TPCC_IPR Bit Set	TCC values in EDMA_TPCC_OPT_n[17:12] TCC (EDMA_TPCC_OPT_n[20] TCINTEN / EDMA_TPCC_OPT_n[21] ITCINTEN = 1)	EDMA_TPCC_IPRH Bit Set ⁽¹⁾
0	EDMA_TPCC_IPR[0]	20h	EDMA_TPCC_IPR[32] / EDMA_TPCC_IPRH[0]
1	EDMA_TPCC_IPR[1]	21h	EDMA_TPCC_IPR[33] / EDMA_TPCC_IPRH[1]
2h	EDMA_TPCC_IPR[2]	22h	EDMA_TPCC_IPR[34] / EDMA_TPCC_IPRH[2]
3h	EDMA_TPCC_IPR[3]	23h	EDMA_TPCC_IPR[35] / EDMA_TPCC_IPRH[3]
4h	EDMA_TPCC_IPR[4]	24h	EDMA_TPCC_IPR[36] / EDMA_TPCC_IPRH[4]
...
1Eh	EDMA_TPCC_IPR[30]	3Eh	EDMA_TPCC_IPR[62] / EDMA_TPCC_IPRH[30]
1Fh	EDMA_TPCC_IPR[31]	3Fh	EDMA_TPCC_IPR[63] / EDMA_TPCC_IPRH[31]

(1) Bit fields EDMA_TPCC_IPR [32-63] correspond to bits 0 to 31 in EDMA_TPCC_IPRH, respectively.

The transfer completion code (TCC) can program to any value for a DMA/QDMA channel. A direct relation between the channel number and the transfer completion code value does not need to exist. This allows multiple channels having the same transfer completion code value to cause a CPU to execute the same interrupt service routine (ISR) for different channels.

If the channel is used in the context of a shadow region and it intends for the shadow region interrupt to be asserted, then ensure that the bit corresponding to the TCC code is enabled in EDMA_TPCC_IER / EDMA_TPCC_IERH and in the corresponding shadow region's DMA region access registers (EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k).

Interrupt generation can be enabled at either final transfer completion or intermediate transfer completion, or both. Consider channel *m* as an example.

- If the final transfer interrupt (EDMA_TPCC_OPT_n[20] TCINTEN = 1) is enabled, the interrupt occurs after the last transfer request of channel *m* is either submitted or completed (depending on early or normal completion).
- If the intermediate transfer interrupt (EDMA_TPCC_OPT_n[21] ITCINTEN = 1) is enabled, the interrupt occurs after every transfer request, except the last TR of channel *m* is either submitted or completed (depending on early or normal completion).

- If both final and intermediate transfer completion interrupts (EDMA_TPCC_OPT_n[20] TCINTEN = 1, and EDMA_TPCC_OPT_n[21] ITCINTEN = 1) are enabled, then the interrupt occurs after every transfer request is submitted or completed (depending on early or normal completion).

Table 11-21 shows the number of interrupts that occur in different synchronized scenarios. Consider channel 31, programmed with ABCNT_n[15:0] ACNT = 3, EDMA_TPCC_ABCNT_n[31:16] BCNT = 4, EDMA_TPCC_CCNT_n[15:0] CCNT = 5, and EDMA_TPCC_OPT_n[17:12] TCC = 30.

Table 11-21. Number of Interrupts

Options	A-Synchronized	AB-Synchronized
EDMA_TPCC_OPT_n[20] TCINTEN = 1, EDMA_TPCC_OPT_n[21] ITCINTEN = 0	1 (Last TR)	1 (Last TR)
EDMA_TPCC_OPT_n[20] TCINTEN = 0, EDMA_TPCC_OPT_n[21] ITCINTEN = 1	19 (All but the last TR)	4 (All but the last TR)
EDMA_TPCC_OPT_n[20] TCINTEN = 1, EDMA_TPCC_OPT_n[21] ITCINTEN = 1	20 (All TRs)	5 (All TRs)

11.3.9.1.1 Enabling Transfer Completion Interrupts

For the EDMA channel controller to assert a transfer completion to the external environment, the interrupts must be enabled in the EDMA_TPCC. This is in addition to setting up the EDMA_TPCC_OPT_n[20] TCINTEN and EDMA_TPCC_OPT_n[21] ITCINTEN bits of the associated PaRAM set.

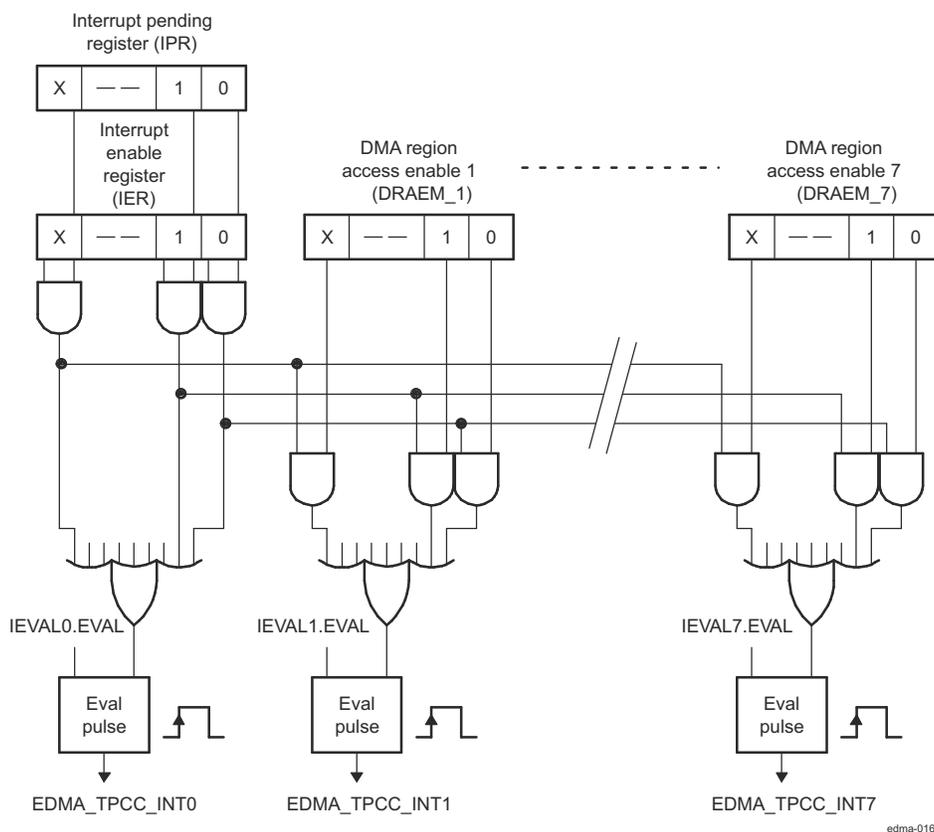

The EDMA channel controller has interrupt enable registers EDMA_TPCC_IER / EDMA_TPCC_IERH and each bit location in EDMA_TPCC_IER / EDMA_TPCC_IERH serves as a primary enable for the corresponding interrupt pending registers EDMA_TPCC_IPR / EDMA_TPCC_IPRH.

All of the interrupt registers (EDMA_TPCC_IER, EDMA_TPCC_IESR, EDMA_TPCC_IECR, and EDMA_TPCC_IPR) are either manipulated from the global DMA channel region, or by the DMA channel shadow regions. The shadow regions provide a view to the same set of physical registers that are in the global region.

The EDMA channel controller has a hierarchical completion interrupt scheme that uses a single set of interrupt pending registers EDMA_TPCC_IPR / EDMA_TPCC_IPRH and single set of interrupt enable registers EDMA_TPCC_IER / EDMA_TPCC_IERH. The programmable DMA region access enable registers EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k provides a second level of interrupt masking. The global region interrupt output is gated based on the enable mask that is provided by EDMA_TPCC_IER / EDMA_TPCC_IERH, see [Figure 11-16](#)

The region interrupt outputs are gated by EDMA_TPCC_IER and the specific EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k associated with the region.

[Figure 11-16](#) shows the Interrupt diagram of the EDMA controller.

Figure 11-16. Interrupt Diagram

The EDMA_TPCC generates the transfer completion interrupts that are associated with each shadow region, the following conditions must be true:

- EDMA_TPCC_INT0: (EDMA_TPCC_IPR[0] E0 & EDMA_TPCC_IER[0] E0 & EDMA_TPCC_DRAEM_k.DRAEM_0[0] E0) | (EDMA_TPCC_IPR[1] E1 & EDMA_TPCC_IER[1] E1 & EDMA_TPCC_DRAEM_k.DRAEM_0[1] E1) | ...|(EDMA_TPCC_IPRH[31] E63 & EDMA_TPCC_IERH[31] E63 & EDMA_TPCC_DRAEHM_k.DRAEHM_0[31] E63)
- EDMA_TPCC_INT1: (EDMA_TPCC_IPR[0] E0 & EDMA_TPCC_IER[0] E0 & EDMA_TPCC_DRAEM_k.DRAEM_1[0] E0) | (EDMA_TPCC_IPR[1] E1 & EDMA_TPCC_IER[1] E1 & EDMA_TPCC_DRAEM_k.DRAEM_1[1] E1) | ...| (EDMA_TPCC_IPRH[31] E63 & EDMA_TPCC_IERH[31] E63 & EDMA_TPCC_DRAEHM_k.DRAEHM_1[31] E63)
- EDMA_TPCC_INT2: (EDMA_TPCC_IPR[0] E0 & EDMA_TPCC_IER[0] E0 & EDMA_TPCC_DRAEM_k.DRAEM_2[0] E0) | (EDMA_TPCC_IPR[1] E1 & EDMA_TPCC_IER[1] E1 & EDMA_TPCC_DRAEM_k.DRAEM_2[1] E1) | ...|(EDMA_TPCC_IPRH[31] E63 & EDMA_TPCC_IERH[31] E63 & EDMA_TPCC_DRAEHM_k.DRAEHM_2[31] E63)....
- Up to EDMA_TPCC_INT7: (EDMA_TPCC_IPR[0] E0 & EDMA_TPCC_IER[0] E0 & EDMA_TPCC_DRAEM_k.DRAEM_7[0] E0) | (EDMA_TPCC_IPR[1] E1 & EDMA_TPCC_IER[1] E1 & EDMA_TPCC_DRAEM_k.DRAEM_7[1] E1) | ...|(EDMA_TPCC_IPRH[31] E63 & EDMA_TPCC_IERH[31] E63 & EDMA_TPCC_DRAEHM_k.DRAEHM_7[31] E63)

Note

The EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k for all regions are expected to be set up at system initialization and to remain static for an extended period of time. The interrupt enable registers are used for dynamic enable/disable of individual interrupts.

Because there is no relation between the EDMA_TPCC_OPT_n[17:12] TCC value and the DMA/QDMA channel, it is possible, the DMA channel 0 to have the EDMA_TPCC_OPT_n[17:12] TCC = 63 in its associated PaRAM set. This means that if a transfer completion interrupt is enabled (EDMA_TPCC_OPT_n[20] TCINTEN or EDMA_TPCC_OPT_n[21] ITCINTEN is set), then based on the TCC value, EDMA_TPCC_IPRH[31] E63 is set up on completion. For proper channel operations and interrupt generation using the shadow region map - program the EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k that is associated with the shadow region to have read/write access to both bit 0 (corresponding to channel 0) and bit 63 (corresponding to EDMA_TPCC_IPRH bit that is set upon completion).

11.3.9.1.2 Clearing Transfer Completion Interrupts

Transfer completion interrupts that are latched to the interrupt pending registers (EDMA_TPCC_IPR / EDMA_TPCC_IPRH) are cleared by writing a 1 to the corresponding bit in the interrupt pending clear register (EDMA_TPCC_ICR / EDMA_TPCC_ICRH). For example, a write of 1 to EDMA_TPCC_ICR[0] E0 clears a pending interrupt in EDMA_TPCC_IPR[0] E0.

If an incoming transfer completion code TCC (EDMA_TPCC_OPT_n[17:12] TCC) gets latched to a bit in EDMA_TPCC_IPR / EDMA_TPCC_IPRH, then additional bits that get set due to a subsequent transfer completion does not result in asserting the EDMA_TPCC completion interrupt. In order for the completion interrupt to be pulsed, the required transition is from a state where no enabled interrupts are set to a state where at least one enabled interrupt is set.

11.3.9.2 EDMA Interrupt Servicing

Upon completion of a transfer (early or normal completion), the EDMA channel controller sets the appropriate bit in the interrupt pending registers (EDMA_TPCC_IPR / EDMA_TPCC_IPRH), as the transfer completion codes specify. If the completion interrupts are appropriately enabled, then the CPU enters the interrupt service routine (ISR) when the completion interrupt is asserted.

After servicing the interrupt, the ISR should clear the corresponding bit in EDMA_TPCC_IPR/ EDMA_TPCC_IPRH, thereby enabling recognition of future interrupts. The EDMA_TPCC only asserts additional completion interrupts when all EDMA_TPCC_IPR / EDMA_TPCC_IPRH bits clear.

When one interrupt is serviced many other transfer completions may result in additional bits being set in EDMA_TPCC_IPR / EDMA_TPCC_IPRH, thereby resulting in additional interrupts. Each of the bits in EDMA_TPCC_IPR / EDMA_TPCC_IPRH may need different types of service therefore, the ISR must check all pending interrupts and continue until all of the posted interrupts are serviced appropriately.

Examples of pseudo code for a CPU interrupt service routine for an EDMA_TPCC completion interrupt are shown in [Example 11-2](#) and [Example 11-3](#).

The ISR routine in [Example 11-2](#) is more exhaustive and incurs a higher latency.

Example 11-2. Interrupt Servicing

The pseudo code:

1. Reads the interrupt pending register EDMA_TPCC_IPR / EDMA_TPCC_IPRH.
2. Performs the operations needed.
3. Writes to the interrupt pending clear register EDMA_TPCC_ICR / EDMA_TPCC_ICRH to clear the corresponding EDMA_TPCC_IPR / EDMA_TPCC_IPRH bit(s).
4. Reads EDMA_TPCC_IPR / EDMA_TPCC_IPRH again:

- a. If EDMA_TPCC_IPR / EDMA_TPCC_IPRH is not equal to 0, repeat from step 2 (implies occurrence of new event between step 2 to step 4).
- b. If EDMA_TPCC_IPR / EDMA_TPCC_IPRH is equal to 0, assure that all of the enabled interrupts are inactive.

Note

An event may occur during step 4 while the EDMA_TPCC_IPR / EDMA_TPCC_IPRH bits are read as 0 and the application is still in the interrupt service routine. If this happens, a new interrupt is recorded in the device interrupt controller and a new interrupt generates as soon as the application exits in the interrupt service routine.

11.3.9.3

[Example 11-3](#) is less rigorous, with less burden on the software in polling for set interrupt bits, but can occasionally cause a race condition as mentioned above.

Example 11-3. Interrupt Servicing

If any enabled and pending (possibly lower priority) interrupts are left, force the interrupt logic to reassert the interrupt pulse by setting the EDMA_TPCC_IEVAL[0] EVAL bit in the interrupt evaluation register.

The pseudo code is as follows:

1. Enters ISR.
2. Reads EDMA_TPCC_IPR / EDMA_TPCC_IPRH.
3. For the condition that is set in EDMA_TPCC_IPR / EDMA_TPCC_IPRH:
 - a. Service interrupt as the application requires.
 - b. Clear the bit for serviced conditions (others may still be set, and other transfers may have resulted in returning the TCC to EDMA_TPCC after step 2).
4. Reads EDMA_TPCC_IPR / EDMA_TPCC_IPRH prior to exiting the ISR:
 - a. If EDMA_TPCC_IPR / EDMA_TPCC_IPRH is equal to 0, then exit the ISR.
 - b. If EDMA_TPCC_IPR / EDMA_TPCC_IPRH is not equal to 0, then set EDMA_TPCC_IEVAL so that upon exit of ISR, a new interrupt triggers if any enabled interrupts are still pending.

11.3.9.4 Interrupt Evaluation Operations

The EDMA_TPCC has interrupt evaluate registers EDMA_TPCC_IEVAL that exist in the global region and in each shadow region. The registers in the shadow region are the only registers in the DMA channel shadow region memory map that are not affected by the settings for the DMA region access enable registers EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k. Writing a 1 to the EDMA_TPCC_IEVAL[0] EVAL bit in the registers that are associated with a particular shadow region results in pulsing the associated region interrupt (global or shadow), if any enabled interrupt (via EDMA_TPCC_IER / EDMA_TPCC_IERH) is still pending EDMA_TPCC_IPR / EDMA_TPCC_IPRH. This register assures that the CPU does not miss the interrupts (or the EDMA controller associated with the shadow region) if the software architecture chooses not to use all interrupts. Refer to [Example 11-3](#) about the use of EDMA_TPCC_IEVAL in the EDMA interrupt service routine (ISR).

Similarly an error evaluation register EDMA_TPCC_EEVAL exists in the global region. Writing a 1 to the EDMA_TPCC_EEVAL[0] EVAL bit causes the pulsing of the error interrupt if any pending errors are in EDMA_TPCC_EMR / EDMA_TPCC_EMRH, EDMA_TPCC_QEMR, or EDMA_TPCC_CCERR. See [Section 11.3.9.5 Error Interrupts](#) for additional information regarding error interrupts.

Note

While using EDMA_TPCC_I EVAL for shadow region completion interrupts, check that the EDMA_TPCC_I EVAL operated upon is from that particular shadow region memory map.

11.3.9.5 Error Interrupts

The EDMA_TPCC error registers provide the capability to differentiate error conditions (event missed, threshold exceed, etc.). Additionally, setting the error bits in these registers results in asserting the EDMA_TPCC error interrupt. If the EDMA_TPCC error interrupt is enabled in the device interrupt controller(s), then it allows the CPU(s) to handle the error conditions.

The EDMA_TPCC has a single error interrupt (EDMA_TPCC_ERRINT) that is asserted for all EDMA_TPCC error conditions. There are four conditions that cause the error interrupt:

- DMA missed events: for all 64 DMA channels. DMA missed events are latched in the event missed registers EDMA_TPCC_EMR / EDMA_TPCC_EMRH.
- QDMA missed events: for all 8 QDMA channels. QDMA missed events are latched in the QDMA event missed register EDMA_TPCC_QEMR.
- Threshold exceed: for all event queues. These are latched in EDMA_TPCC error register EDMA_TPCC_CCERR.
- TCC error: for outstanding transfer requests that are expected to return completion code EDMA_TPCC_OPT_n[22] TCCHEN or EDMA_TPCC_OPT_n[23] TCINTEN bit is set to 1, exceeding the maximum limit of 63. This is also latched in the EDMA_TPCC error register EDMA_TPCC_CCERR.

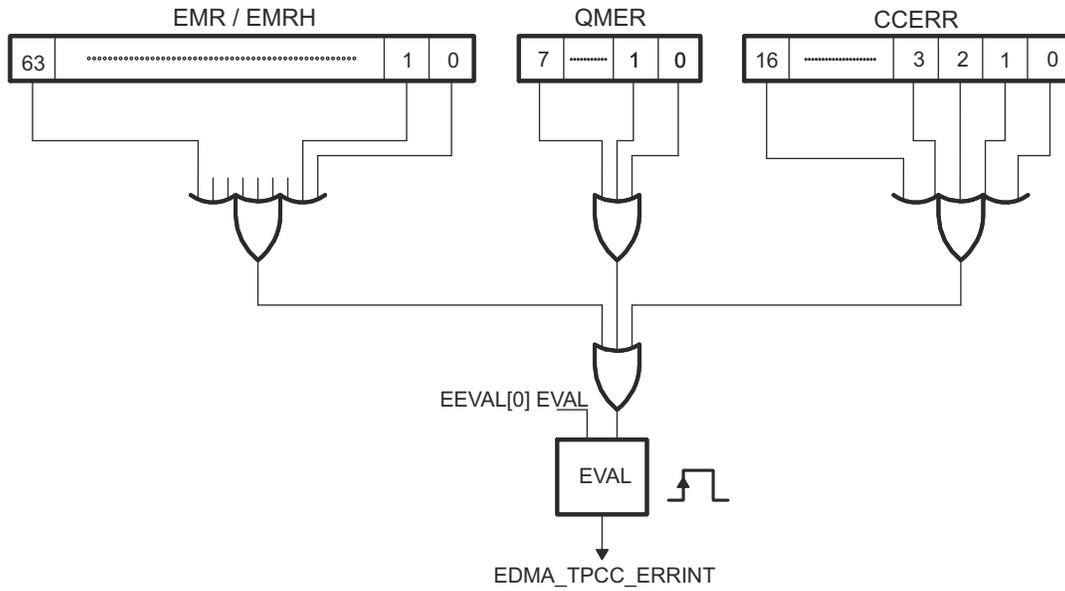

Figure 11-17 illustrates the EDMA_TPCC error interrupt generation operation.

If any of the bits are set in the error registers due to any error condition, the EDMA_TPCC_ERRINT is always asserted, as there are no enables for masking these error events. Similar to transfer completion interrupts (EDMA_TPCC_INT), the error interrupt also only pulses when the error interrupt condition transitions from no errors being set to at least one error being set. If additional error events are latched prior to the original error bits clearing, the EDMA_TPCC does not generate additional interrupt.

To reduce the burden on the software, there is an error evaluate register EDMA_TPCC_EEVAL that allows re-evaluation of pending set error events/bits, similar to the interrupt evaluate register EDMA_TPCC_IEVAL. Unlike the EDMA_TPCC_IEVAL functionality, the EDMA_TPCC_EEVAL register must be written with '1' after any error interrupts are serviced (even when all pending errors are cleared) in order for subsequent errors to trigger a new interrupt.

Note

It is good practice to enable the error interrupt in the device interrupt controller and to associate an interrupt service routine with it to address the various error conditions appropriately. Doing so puts less burden on the software (polling for error status), it provides a good debug mechanism for unexpected error conditions.

Figure 11-17. Error Interrupt Operation

11.3.10 Memory Protection

The EDMA channel controller supports two kinds of memory protection: active and proxy.

11.3.10.1 Active Memory Protection

Active memory protection is a feature that allows or prevents read and write accesses to the EDMA_TPCC registers. Active memory protection is achieved by a set of memory protection permissions attribute EDMA_TPCC_MPPAN_k registers.

The EDMA_TPCC register map is divided into three categories:

- a global region.
- a global channel region.
- eight shadow regions.

Each shadow region consists of the respective shadow region registers and the associated PaRAM. For more detailed information regarding the contents of a shadow region, refer to the associated Register Addendum.

Each of the eight shadow regions has an associated EDMA_TPCC_MPPAN_k registers that defines the specific requestor(s) and types of requests that are allowed to the regions resources.

The global channel region is also protected with a memory-mapped register EDMA_TPCC_MPPAG. The EDMA_TPCC_MPPAG applies to the global region and to the global channel region, except the other EDMA_TPCC_MPPAN_k registers themselves.

Table 11-22 shows the accesses that are allowed or not allowed to the EDMA_TPCC_MPPAG and EDMA_TPCC_MPPAN_k. The active memory protection uses the EDMA_TPCC_OPT_n[31] PRIV and EDMA_TPCC_OPT_n[27:24] PRIVID attributes of the EDMA peripheral modules. The EDMA_TPCC_OPT_n[31] PRIV is the privilege level (i.e., user vs. supervisor).

The EDMA_TPCC_OPT_n[27:24] PRIVID refers to a privilege ID with a number that is associated with an EDMA peripheral modules.

Table 11-22. Allowed Accesses

Access	Supervisor	User
Read	Yes	Yes
Write	Yes	No

Table 11-23 describes the EDMA_TPCC_MPPAN_k register mapping for the shadow regions (which includes shadow region registers and PaRAM addresses).

The region-based EDMA_TPCC_MPPAN_k registers are used to protect accesses to the DMA shadow regions and the associated region PaRAM. Because there are eight regions, there are eight EDMA_TPCC_MPPAN_k region registers (MPPAN[0-7]).

Table 11-23. MPPA Registers to Region Assignment

Register	Registers Protect	Address Range	PaRAM Protect ⁽¹⁾	Address Range
EDMA_TPCC_MPPAG	Global Range	0000h-1FFCh	N/A	N/A
EDMA_TPCC_MPPAN_k. MPPAN_0	DMA Shadow 0	2000h-21FCh	1st octant	4000h-47FCh
MPPAN_1	DMA Shadow 1	2200h-23FCh	2nd octant	4800h-4FFCh
MPPAN_2	DMA Shadow 2	2400h-25FCh	3rd octant	5000h-57FCh
MPPAN_3	DMA Shadow 3	2600h-27FCh	4th octant	5800h-5FFCh
MPPAN_4	DMA Shadow 4	2800h-29FCh	5th octant	6000h-67FCh
MPPAN_5	DMA Shadow 5	2A00h-2BFCh	6th octant	6800h-6FFCh
MPPAN_6	DMA Shadow 6	2C00h-2DFCh	7th octant	7000h-77FCh
MPPAN_7	DMA Shadow 7	2E00h-2FFCh	8th octant	7800h-7FFCh

(1) The PARAM region is divided into 8 regions referred to as an octant.

Example Access denied.

Write access to shadow region 7's event enable set register EDMA_TPCC_EESR:

1. The original value of the event enable register EDMA_TPCC_EER at address offset 0x1020 is 0x0.
2. The EDMA_TPCC_MPPAN_k.EDMA_TPCC_MPPAN_7[7] NS is set to prevent user level accesses (EDMA_TPCC_MPPAN_k.EDMA_TPCC_MPPAN_7[1] UW = 0, EDMA_TPCC_MPPAN_k.EDMA_TPCC_MPPAN_7[2] UR = 0), but it allows supervisor level accesses (EDMA_TPCC_MPPAN_k.EDMA_TPCC_MPPAN_7[4] SW = 1, EDMA_TPCC_MPPAN_k.EDMA_TPCC_MPPAN_7[5] SR = 1) with a privilege ID of 0. (EDMA_TPCC_MPPAN_k.EDMA_TPCC_MPPAN_7[10] AID0 = 1).
3. EDMA peripheral modules with a privilege ID of 0 attempts to perform a user-level write of a value of 0xFF00FF00 to shadow region 7's event enable set register EDMA_TPCC_EESR at address offset 0x2E30.

Note

The EDMA_TPCC_EER is a read-only register and the only way that write to it is by writing to the EDMA_TPCC_EESR. There is only one physical register for EDMA_TPCC_EER, EDMA_TPCC_EESR, etc. and that the shadow regions only provide to the same physical set.

4. Since the EDMA_TPCC_MPPAN_k.EDMA_TPCC_MPPAN_7[1] UW = 0, though the privilege ID of the write access is set to 0, the access is not allowed and the EDMA_TPCC_EER is not written too.

Table 11-24. Example Access Denied

Register	Value	Description
EDMA_TPCC_EER (offset 0x1020)	0x0000 0000	Value in EDMA_TPCC_EER to begin with.
EDMA_TPCC_EESR (offset 0x2E30)	0xFF00 FF00 ↓	Value attempted to be written to shadow region 7's EDMA_TPCC_EESR. This is done by an EDMA connected device module with a privilege level of User and Privilege ID of 0.
EDMA_TPCC_MPPAN_k (offset 0x082C)	0x0000 04B0 X	Memory Protection Filter EDMA_TPCC_MPPAN_k[10] AID0 = 1, EDMA_TPCC_MPPAN_k[1] UW = 0, EDMA_TPCC_MPPAN_k[2] UR = 0, EDMA_TPCC_MPPAN_k[4] SW = 1, EDMA_TPCC_MPPAN_k[5] SR = 1. Access Denied
EDMA_TPCC_EER (offset 0x1020)	0x0000 0000	Final value of EDMA_TPCC_EER

Example Access Allowed

Write access to shadow region 7's event enable set register EDMA_TPCC_EESR:

1. The original value of the event enable register EDMA_TPCC_EER at address offset 0x1020 is 0x0.
2. The EDMA_TPCC_MPPAN_k.EDMA_TPCC_MPPAN_7 is set to allow user-level accesses (EDMA_TPCC_MPPAN_k.EDMA_TPCC_MPPAN_7[1] UW = 1, EDMA_TPCC_MPPAN_k.EDMA_TPCC_MPPAN_7[2] UR = 1) and supervisor-level accesses (EDMA_TPCC_MPPAN_k.EDMA_TPCC_MPPAN_7[4] SW = 1, EDMA_TPCC_MPPAN_k.EDMA_TPCC_MPPAN_7[5] SR = 1) with a privilege ID of 0. (EDMA_TPCC_MPPAN_k.EDMA_TPCC_MPPAN_7[10] AID0 = 1).
3. EDMA peripheral modules with a privilege ID of 0, attempts to perform a user-level write of a value of 0xABCD0123 to shadow region 7's event enable set register EDMA_TPCC_EESR at address offset 0x2E30.

Note

The EDMA_TPCC_EER is a read-only register and the only way that write to it is by writing to the EDMA_TPCC_EESR. There is only one physical register for EDMA_TPCC_EER, EDMA_TPCC_EESR, etc. and that the shadow regions only provide to the same physical set.

4. Since the EDMA_TPCC_MPPAN_k.EDMA_TPCC_MPPAN_7[1] UW = 1 and EDMA_TPCC_MPPAN_k.MPPAN_7[10] AID0 = 1, the user-level write access is allowed.
5. The accesses to shadow region registers are masked by their respective EDMA_TPCC_DRAEM_k register. In this example, the EDMA_TPCC_DRAEM_k.EDMA_TPCC_DRAEM_7 is set of 0x9FF00FC2.

6. The value finally written to EDMA_TPCC_EER is 0x8BC00102.

Table 11-25. Example Access Allowed

Register	Value	Description
EDMA_TPCC_EER (offset 0x1020)	0x0000 0000	Value in EER to begin with.
EDMA_TPCC_EESR (offset 0x2E30)	0xFF00 FF00	Value attempted to be written to shadow region 7's EESR. This is done by an EDMA peripheral module with a privilege level of User and Privilege ID of 0.
EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7 (offset 0x082C)	0x0000 04B3	Memory Protection Filter EDMA_TPCC_MPPAN_k[10] AID = 1, EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[1] UW = 1, EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[2] UR = 1, EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[4] SW = 1, EDMA_TPCC_MPPAN_k. EDMA_TPCC_MPPAN_7[5] SR = 1.
	√ ↓	Access allowed.
EDMA_TPCC_DRAEM_k. EDMA_TPCC_DRAEM_7 (offset 0x0378)	0x9FF0 0FC2 ↓	DMA Region Access Enable Filter
EDMA_TPCC_EESR (offset 0x2E30)	0x8BC0 0102 ↓	Value written to shadow region 7's EESR. This is done by an EDMA peripheral module with a privilege level of User and a Privilege ID of 0.
EDMA_TPCC_EER (offset 0x1020)	0xBC0 0102	Final value of EER.

11.3.10.2 Proxy Memory Protection

Proxy memory protection allows an EDMA transfer programmed by a given peripheral module connected to EDMA, to have its permissions travel with the transfer through the EDMA_TPTC. The permissions travel along with the read transactions to the source and the write transactions to the destination endpoints. The EDMA_TPCC_OPT_n[31] PRIV bit and EDMA_TPCC_OPT_n[27:24] PRIVID bit is set with the peripheral module's PRIV value and PRIVID values, respectively, when any part of the PaRAM set is written.

The EDMA_TPCC_OPT_n[31] PRIV is the privilege level (i.e., user vs. supervisor). The EDMA_TPCC_OPT_n[27:24] PRIVID refers to a privilege ID with a number that is associated with an peripheral module connected to EDMA.

These options are part of the TR that are submitted to the transfer controller. The transfer controller uses the above values on their respective read and write command bus so that the target endpoints can perform memory protection checks based on these values.

Consider a parameter set that is programmed by a CPU in user privilege level for a simple transfer with the source buffer on an L2 page and the destination buffer on an L1D page. The EDMA_TPCC_OPT_n[31] PRIV is 0 for user-level and the CPU has a EDMA_TPCC_OPT_n[27:24] PRIVID to 0.

The PaRAM set is shown in [Figure 11-18](#).

Figure 11-18. PaRAM Set Content for Proxy Memory Protection Example

(a) EDMA Parameters

Parameter Contents		Parameter	
0010 0007h		Channel Options Parameter (OPT)	
009F 0000h		Channel Source Address (SRC)	
0001h	0004h	Count for 2nd Dimension (BCNT)	Count for 1st Dimension (ACNT)
00F0 7800h		Channel Destination Address (DST)	
0001h	0001h	Destination BCNT Index (DBIDX)	Source BCNT Index (SBIDX)
0000h	FFFFh	BCNT Reload (BCNTRLD)	Link Address (LINK)
0001h	1000h	Destination CCNT Index (DCIDX)	Source CCNT Index (SCIDX)
0000h	0001h	Reserved	Count for 3rd Dimension (CCNT)

(b) Channel Options Parameter (OPT_n) Content

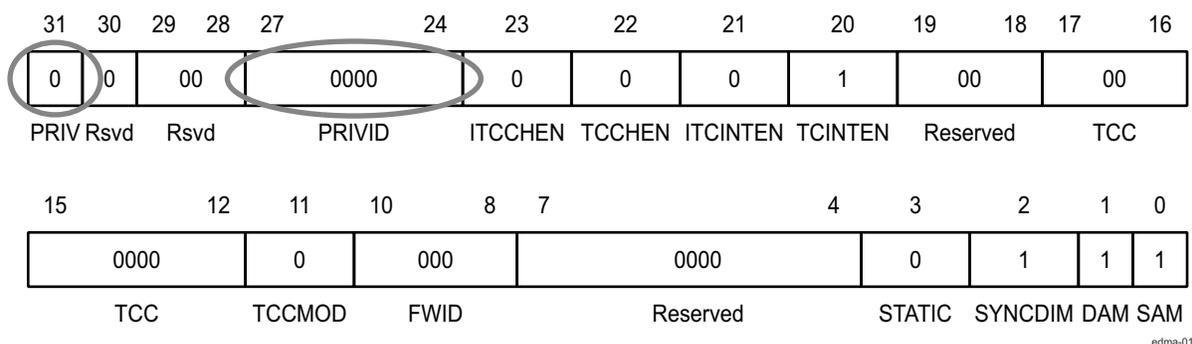

Figure 11-19. Channel Options Parameter (OPT) Example

The EDMA_TPCC_OPT_n[31] PRIV and EDMA_TPCC_OPT_n[27:24] PRIVID information travels along with the read and write requests that are issued to the source and destination memories.

For example, if the access attributes that are associated with the L2 page with the source buffer only allow supervisor read, write accesses EDMA_TPCC_MPPAN_k[4] SW and EDMA_TPCC_MPPAN_k[5] SR, the user-level read request above is refused. Similarly, if the access attributes that are associated with the L1D page with the destination buffer only allow supervisor read and write accesses (EDMA_TPCC_MPPAN_k[4] SW, EDMA_TPCC_MPPAN_k[5] SR), the user-level write request above is refused. For the transfer to succeed, the source and destination pages must have user-read and user-write permissions, respectively, along with allowing accesses from a PRIVID = 0.

Because the privilege level and privilege identification travel with the read and write requests, EDMA acts as a proxy.

Figure 11-20 illustrates the propagation of EDMA_TPCC_OPT_n[31] PRIV and EDMA_TPCC_OPT_n[27:24] PRIVID at the boundaries of all the interacting entities (CPU, EDMA_TPCC, EDMA_TPTCs, and slave memories).

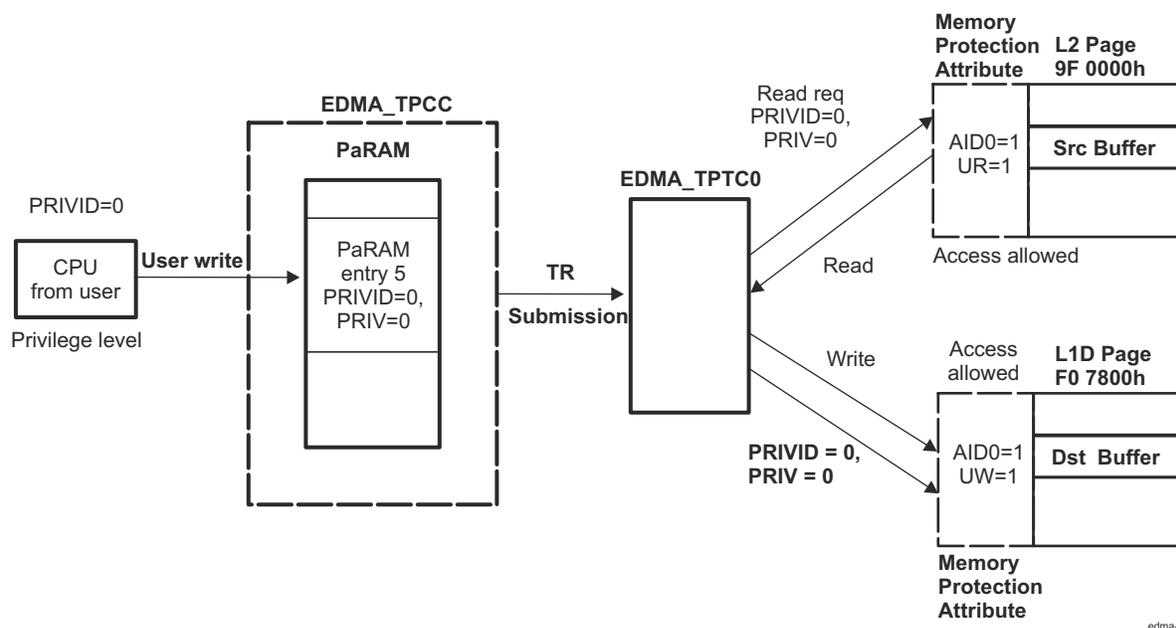

Figure 11-20. Proxy Memory Protection Example

11.3.11 Event Queue(s)

Event queues are a part of the EDMA channel controller. Event queues form the interface between the event detection logic in the EDMA_TPCC and the transfer request (TR) submission logic of the EDMA_TPCC. Each queue is 16 entries deep. Each event queue can queue a maximum of 16 events. If there are more than 16 events, then the events that cannot find a place in the event queue remain set in the associated event register and the CPU does not stall.

There are two event queues for the device: Queue0, Queue1. Events in Queue0 result in submission of its associated transfer requests (TRs) to TC0. The transfer requests that are associated with events in Queue1 are submitted to TC1.

An event that wins prioritization against other DMA and/or QDMA pending events is placed at the tail of the appropriate event queue. Each event queue is serviced in FIFO order. Once the event reaches the head of its queue and the corresponding transfer controller is ready to receive another TR, the event is de-queued and the PaRAM set corresponding to the de-queued event is processed and submitted as a transfer request packet (TRP) to the associated EDMA transfer controller.

Queue0 has highest priority and Queue1 has the lowest priority, if Queue0 and Queue1 both have at least one event entry and if both TC0 and TC1 can accept transfer requests, then the event in Queue0 is de-queued first and its associated PaRAM set is processed and submitted as a transfer request (TR) to TC0.

Refer to *Performance Considerations* for system-level performance considerations. All of the event entries in all of the event queues are software readable (not writeable) by accessing the event entry registers EDMA_TPCC_Q0E_p and EDMA_TPCC_Q1E_p. Each event entry register characterizes the queued event in terms of the type of event (manual, event, chained or auto-triggered) and the event number. Refer to the associated Register Addendum for EDMA_TPCC_Q0E_p / EDMA_TPCC_Q1E_p descriptions of the bit fields.

11.3.11.1 DMA/QDMA Channel to Event Queue Mapping

Each of the 64 DMA channels and eight QDMA channels are programmed independently to map to a specific queue, using the DMA queue number register EDMA_TPCC_DMAQNUMN_k and the QDMA queue number register EDMA_TPCC_QDMAQNUM. The mapping of DMA/QDMA channels is critical to achieving the desired performance level for the EDMA and most importantly, in meeting real-time deadlines. Refer to *System-level Performance Considerations*.

Note

If an event is ready to be queued and both the event queue and the EDMA transfer controller that is associated to the event queue are empty, then the event bypasses the event queue, and moves the PaRAM processing logic, and eventually to the transfer request submission logic for submission to the EDMA_TPTC. In this case, the event is not logged in the event queue status registers.

11.3.11.2 Queue RAM Debug Visibility

There are two event queues and each queue has 16 entries. These 16 entries are managed in a circular FIFO. There is a queue status register EDMA_TPCC_QSTATN_i associated with each queue. These along with all of the 16 entries per queue can be read via registers EDMA_TPCC_QSTATN_i and Q0E_p / Q1E_p, respectively.

These registers provide user visibility.

The event queue entry register (QxEy Q0E_p / Q1E_p) uniquely identifies the specific event type (event-triggered, manually-triggered, chain-triggered, and QDMA events) along with the event number (for all DMA/QDMA event channels) that are in the queue or have been de-queued (passed through the queue).

Each of the 16 entries in the event queue are read using the EDMA_TPCC memory-mapped register. To see the history of the last 16 TRs that have been processed by the EDMA on a given queue, read the event queue registers. This provides user/software visibility and is helpful for debugging real-time issues (typically post-mortem), involving multiple events and event sources.

The queue status register (QSTAT n EDMA_TPCC_QSTATN $_i$) includes fields for the start pointer EDMA_TPCC_QSTATN $_i$ [3:0] STRTPTR which provides the offset to the head entry of an event. It also includes a field called EDMA_TPCC_QSTATN $_i$ [12:8] NUMVAL that provides the total number of valid entries residing in the event queue at a given instance of time. The EDMA_TPCC_QSTATN $_i$ [3:0] STRTPTR is used to index appropriately into the 16 event entries. EDMA_TPCC_QSTATN $_i$ [12:8] NUMVAL number of entries starting from STRTPTR are indicative of events still queued in the respective queue. The remaining entry must be read to determine what's already de-queued and submitted to the associated transfer controller.

11.3.11.3 Queue Resource Tracking

The EDMA_TPCC event queue includes watermarking/threshold logic that allows to keep track of maximum usage of all event queues. This is useful for debugging real-time deadline violations that may result from head-of-line blocking on a given EDMA event queue.

The maximum number of events are programmed that the queue up in an event queue by programming the threshold value (between 0 to 15) in the queue watermark threshold A register EDMA_TPCC_QWMTHRA. The maximum queue usage is recorded actively in the watermark EDMA_TPCC_QSTATN $_i$ [20:16] WM field of the queue status register, that keeps getting updated based on a comparison of number of valid entries, which is also visible in the EDMA_TPCC_QSTATN $_i$ [12:8] NUMVAL bit and the maximum number of entries.

If the queue usage is exceeded, this status is visible in the EDMA_TPCC registers: the QTHRXC Dn bits in the channel controller error register EDMA_TPCC_CCERR[7:0] and the EDMA_TPCC_QSTATN $_i$ [24] THRXC D bit, where n stands for the event queue number. Any bits that are set in EDMA_TPCC_CCERR also generate an EDMA_TPCC error interrupt.

11.3.11.4 Performance Considerations

The device system bus infrastructure arbitrates bus requests from all of the controllers (TCs, CPU(S), and other bus controllers) to the shared target resources (peripherals and memories).

Therefore, the priority of unloading queues has a secondary affect compared to the priority of the transfers as they are executed by the EDMA_TPTC.

11.3.12 EDMA Transfer Controller (EDMA_TPTC)

The EDMA channel controller is the user-interface of the EDMA and the EDMA transfer controller (EDMA_TPTC) is the data movement engine of the EDMA controller. The EDMA_TPCC submits transfer requests (TR) to the EDMA_TPTC and the EDMA_TPTC performs the data transfers dictated by the TR, so the EDMA_TPTC is a slave to the EDMA_TPCC.

11.3.12.1 Architecture Details

11.3.12.1.1 Command Fragmentation

The TC read and write controllers in conjunction with the source and destination register sets are responsible for issuing optimally-sized reads and writes to the target endpoints. An optimally-sized command is defined by the transfer controller default burst size (DBS), which is defined in the *TPTC DBS Configuration registers*.

The EDMA_TPTC attempts to issue the largest possible command size as limited by the DBS value or the EDMA_TPCC_ABCNT $_n$ [15:0] ACNT and EDMA_TPCC_ABCNT $_n$ [31:16] BCNT value of the TR. EDMA_TPTC obeys the following rules:

- The read/write controllers always issue commands less than or equal to the DBS value.
- The first command of a 1D transfer command always aligns the address of subsequent commands to the DBS value.

Table 11-26 lists the TR segmentation rules that are followed by the EDMA_TPTC. In summary, if the EDMA_TPCC_ABCNT $_n$ [15:0] ACNT value is larger than the DBS value, then the EDMA_TPTC breaks the EDMA_TPCC_ABCNT $_n$ [15:0] ACNT array into DBS-sized commands to the source/destination addresses. Each EDMA_TPCC_ABCNT $_n$ [31:16] BCNT number of arrays are then serviced in succession.

For BCNT arrays of ACNT bytes (that is, a 2D transfer), if the EDMA_TPCC_ABCNT_n[15:0] ACNT value is less than or equal to the DBS value, then the TR may be optimized into a 1D-transfer in order to maximize efficiency. The optimization takes place if the EDMA_TPTC recognizes that the 2D-transfer is organized as a single dimension (EDMA_TPCC_ABCNT_n[15:0] ACNT == EDMA_TPCC_BIDX_n) and the ACNT value is a power of 2.

Table 11-26 lists conditions in which the optimizations are performed.

Table 11-26. Read/Write Command Optimization Rules

ACNT ≤ DBS	ACNT is power of 2	BIDX = ACNT	BCNT ≤ 1023	SAM/DAM = Increment	Description
Yes	Yes	Yes	Yes	Yes	Optimized
No	x	x	x	x	Not Optimized
x	No	x	x	x	Not Optimized
x	x	No	x	x	Not Optimized
x	x	x	No	x	Not Optimized
x	x	x	x	No	Not Optimized

11.3.12.1.2 TR Pipelining

TR pipelining refers to the ability of the source active set to proceed ahead of the destination active set. Essentially, the reads for a given TR may already be in progress while the writes of a previous TR may not have completed.

The number of outstanding TRs is limited by the number of destination FIFO register entries.

TR pipelining is useful for maintaining throughput on back-to-back small TRs. It minimizes the startup overhead because reads start in the background of a previous TR writes.

Example 11-4. Command Fragmentation (DBS = 64)

The pseudo code:

1. EDMA_TPTCn_PCNT[15:0] ACNT = 8, EDMA_TPTCn_PCNT[31:16] BCNT = 8,
EDMA_TPTCn_PBDX[15:0] SBIDX = 8, EDMA_TPTCn_PBDX[31:16] DBIDX = 10,
EDMA_TPTCn_PSRC[31:0] SADDR = 64, EDMA_TPTCn_SADST[31:0] DADDR = 191

Read Controller: This is optimized from a 2D-transfer to a 1D-transfer such that the read side is equivalent to EDMA_TPTCn_PCNT[15:0] ACNT = 64, EDMA_TPTCn_PCNT[31:16] BCNT = 1.

Cmd0 = 64 byte

Write Controller: Because DBIDX != ACNT, it is not optimized.

Cmd0 = 8 byte, Cmd1 = 8 byte, Cmd2 = 8 byte, Cmd3 = 8 byte, Cmd4 = 8 byte, Cmd5 = 8 byte, Cmd6 = 8 byte, Cmd7 = 8 byte.

2. EDMA_TPTCn_PCNT[15:0] ACNT=128, EDMA_TPTCn_PCNT[31:16] BCNT = 1,
EDMA_TPTCn_PSRC[31:0] SADDR = 63, EDMA_TPTCn_SADST[31:0] DADDR = 513

Read Controller: Read address is not aligned.

Cmd0 = 1 byte, (now the SADDR is aligned to 64 for the next command)

Cmd1 = 64 bytes

Cmd2 = 63 bytes

Write Controller: The write address is also not aligned.

Cmd0 = 63 bytes, (now the DADDR is aligned to 64 for the next command)

Cmd1 = 64 bytes

Cmd2 = 1 byte

11.3.12.1.3 Performance Tuning

By default, reads are as issued as fast as possible. In some cases, the reads issued by the EDMA_TPTC could fill the available command buffering for a target, delaying other (potentially higher priority) controllers from successfully submitting commands to that target. The rate at which read commands are issued by the EDMA_TPTC is controlled by the EDMA_TPTCn_RDRATE register. The EDMA_TPTCn_RDRATE register defines the number of cycles that the EDMA_TPTC read controller waits before issuing subsequent commands for a given TR, thus minimizing the chance of the EDMA_TPTC consuming all available target resources. The EDMA_TPTCn_RDRATE[2:0] RDRATE value must be set to a relatively small value if the transfer controller is targeted for high priority transfers and to a higher value if the transfer controller is targeted for low priority transfers.

In contrast, the Write Interface does not have any performance turning knobs because writes always have an interval between commands as write commands are submitted along with the associated write data.

11.3.12.2 Memory Protection

The transfer controller plays an important role in handling proxy memory protection. There are two access properties associated with a transfer: for instance, the privilege id (system-wide identification assigned to a controller) of the controller initiating the transfer, and the privilege level (user versus supervisor) used to program the transfer. This information is maintained in the PaRAM set when it is programmed in the channel controller. When a TR is submitted to the transfer controller, this information is made available to the EDMA_TPTC and used by the EDMA_TPTC while issuing read and write commands. The read or write commands have the same privilege identification, and privilege level as that programmed in the EDMA transfer in the channel controller.

11.3.12.3 Error Generation

Errors are generated if enabled under three conditions:

- EDMA_TPTC detection of an error signaled by the source or destination address.
- Attempt to read or write to an invalid address in the configuration memory map.
- Detection of a constant addressing mode TR violating the constant addressing mode transfer rules (the source/destination addresses and source/destination indexes must be aligned to 32 bytes).

Either or all error types may be disabled. If an error bit is set and enabled, the error interrupt for the concerned transfer controller is generated.

11.3.12.4 Debug Features

The DMA program register set, DMA source active register set, and the destination FIFO register set are used to derive a brief history of TRs serviced through the transfer controller.

Additionally, the EDMA_TPTC status register EDMA_TPTCn_TCSTAT has dedicated bit fields to indicate the ongoing activity within different parts of the transfer controller:

- The EDMA_TPTCn_TCSTAT[1] SRCACTV bit indicates whether the source active set is active.
- The EDMA_TPTCn_TCSTAT[6:4] DSTACTV bit indicates the number of TRs resident in the destination register active set at a given instance.
- The EDMA_TPTCn_TCSTAT[0] PROGBUSY bit indicates whether a valid TR is present in the DMA program set.

Note

If the TRs are in progression, it must realize that there is a chance that the values read from the EDMA_TPTC status registers will be inconsistent since the EDMA_TPTC changes the values of these registers due to ongoing activities.

It is recommended that to ensure no additional submission of TRs to the EDMA_TPTC in order to facilitate ease of debug.

11.3.12.4.1 Destination FIFO Register Pointer

The destination FIFO register pointer is implemented as a circular buffer with the start pointer being EDMA_TPTCn_TCSTAT[12:11] DFSTRTPTR and a buffer depth of usually 2 or 4. The EDMA_TPTC maintains two important status details in EDMA_TPTCn_TCSTAT that are used during advanced debugging, if necessary. The EDMA_TPTCn_TCSTAT[12:11] DFSTRTPTR is a start pointer, the index to the head of the destination FIFO register. The EDMA_TPTCn_TCSTAT[6:4] DSTACTV is a counter for the number of valid (occupied) entries. These registers are used to get a brief history of transfers.

Examples of some register field values and their interpretation:

- EDMA_TPTCn_TCSTAT[12:11] DFSTRTPTR = 0x0 and EDMA_TPTCn_TCSTAT[6:4] DSTACTV = 0x0 implies that no TRs are stored in the destination FIFO register.
- EDMA_TPTCn_TCSTAT[12:11] DFSTRTPTR = 0x1 and EDMA_TPTCn_TCSTAT[6:4] DSTACTV = 0x2 implies that two TRs are present. The first pending TR is read from the destination FIFO register entry 1 and the second pending TR is read from the destination FIFO register entry 2.
- EDMA_TPTCn_TCSTAT[12:11] DFSTRTPTR = 0x3 and EDMA_TPTCn_TCSTAT[6:4] DSTACTV = 0x2 implies that two TRs are present. The first pending TR is read from the destination FIFO register entry 3 and the second pending TR is read from the destination FIFO register entry 0.

11.3.13 Event Dataflow

This section summarizes the data flow of a single event, from the time the event is latched to the channel controller to the time the transfer completion code is returned. The following steps list the sequence of EDMA_TPCC activity:

1. Event is asserted from an external source (peripheral or external interrupt). This also is similar for a manually-triggered, chained-triggered, or QDMA-triggered event. The event is latched into the EDMA_TPCC_ER[31:0]En / EDMA_TPCC_ERH[31:0] En (or EDMA_TPCC_CER[31:0] En / EDMA_TPCC_CERH[31:0] En, EDMA_TPCC_ESR[31:0] En / EDMA_TPCC_ESRH[31:0] En, EDMA_TPCC_QER[7:0] En) bit.
2. Once an event is prioritized and queued into the appropriate event queue, the EDMA_TPCC_SER[31:0] En \ EDMA_TPCC_SERH[31:0] En (or EDMA_TPCC_QSER[7:0] En) bit is set to inform the event prioritization / processing logic to disregard this event since it is already in the queue. Alternatively, if the transfer controller and the event queue are empty, then the event bypasses the queue.
3. The EDMA_TPCC processing and the submission logic evaluates the appropriate PaRAM set and determines whether it is a non-null and non-dummy transfer request (TR).
4. The EDMA_TPCC clears the EDMA_TPCC_ER[31:0] En/ EDMA_TPCC_ERH[31:0] En (or EDMA_TPCC_CER[31:0] En / EDMA_TPCC_CERH[31:0] En, EDMA_TPCC_ESR[31:0]En / EDMA_TPCC_ESRH[31:0] En, EDMA_TPCC_QER[31:0] En) bit and the EDMA_TPCC_SER[31:0] En/ EDMA_TPCC_SERH[31:0] En bit as soon as it determines the TR is non-null. In the case of a null set, the EDMA_TPCC_SER[31:0] En/ EDMA_TPCC_SERH[31:0] En bit remains set. It submits the non-null/non-dummy TR to the associated transfer controller. If the TR was programmed for early completion, the EDMA_TPCC immediately sets the interrupt pending register (EDMA_TPCC_IPR[31:0] I[TCC] / EDMA_TPCC_IPRH[31:0] I[TCC] - 32).
5. If the TR was programmed for normal completion, the EDMA_TPCC sets the interrupt pending register (EDMA_TPCC_IPR[31:0] I[TCC] / EDMA_TPCC_IPRH[31:0] I[TCC]) when the EDMA_TPTC informs the EDMA_TPCC about completion of the transfer (returns transfer completion codes).
6. The EDMA_TPCC programs the associated EDMA_TPTC's Program Register Set with the TR.
7. The TR is then passed to the Source Active set and the DST FIFO Register Set, if both the register sets are available.
8. The Read Controller processes the TR by issuing read commands to the source slave endpoint. The Read Data lands in the Data FIFO of the EDMA_TPTCn.
9. As soon as sufficient data is available, the Write Controller begins processing the TR by issuing write commands to the destination slave endpoint.
10. This continues until the TR completes and the EDMA_TPTCn then signals completion status to the EDMA_TPCC.

11.3.14 EDMA Controller Prioritization

The EDMA controller has many implementation rules to deal with concurrent events/channels, transfers, etc. The following subsections detail various arbitration details whenever there might be occurrence of concurrent activity. [Figure 11-21](#) shows the different places EDMA priorities come into play.

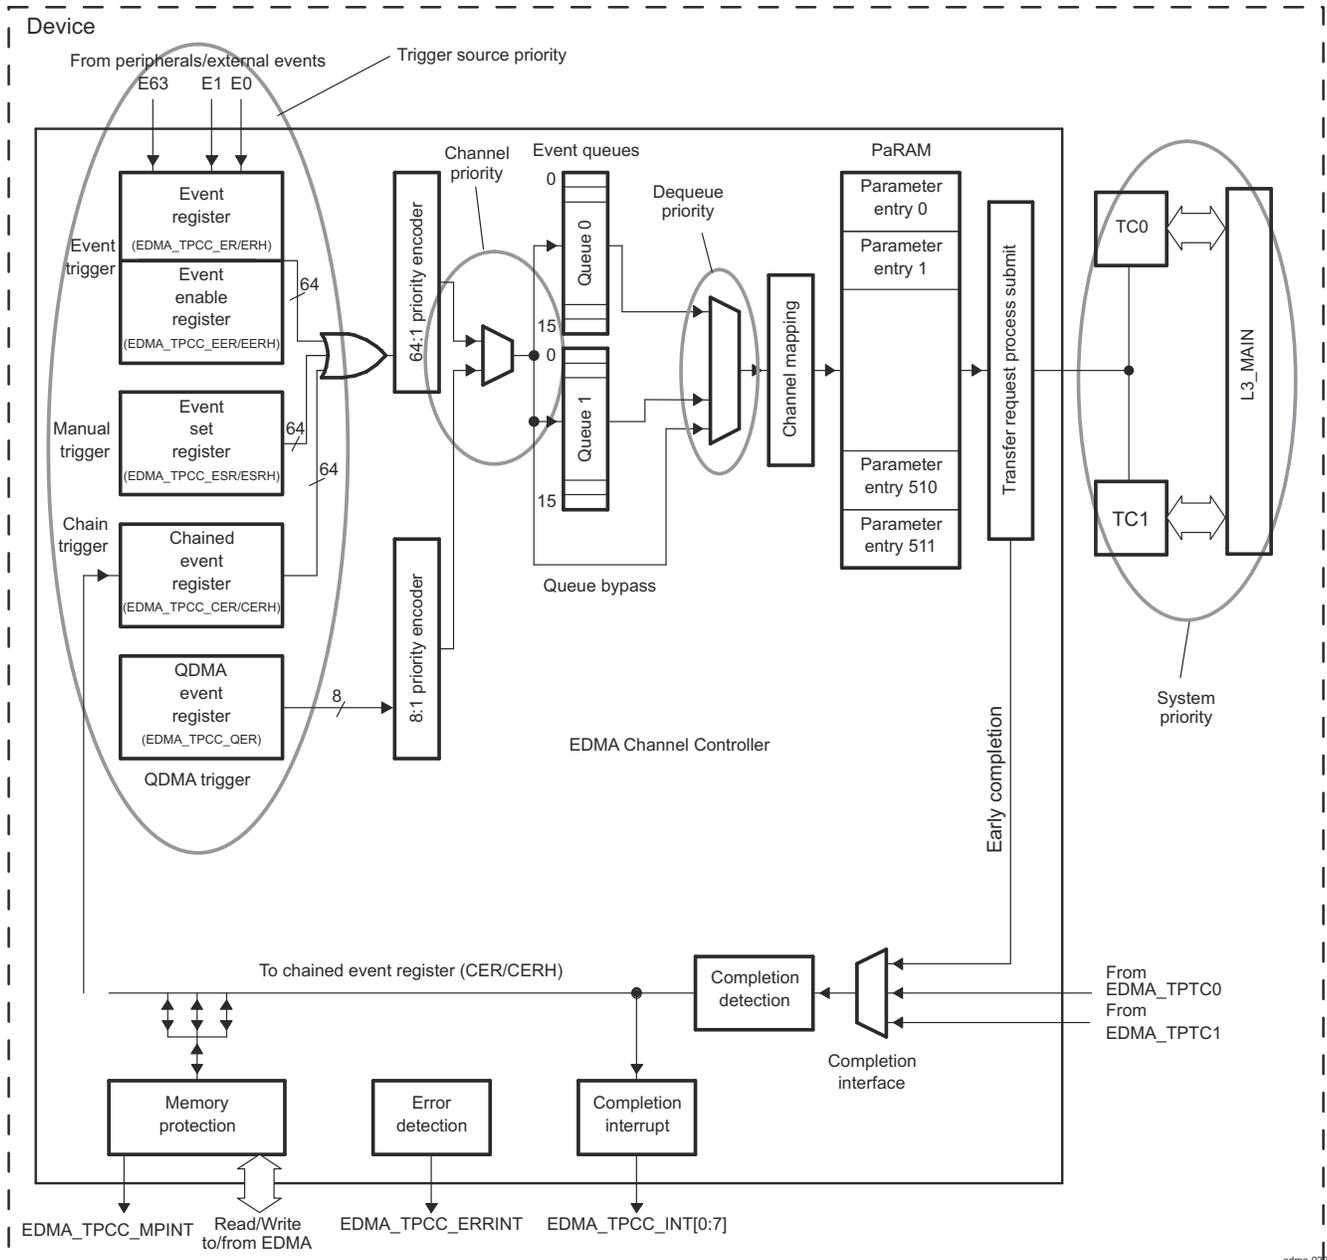

Figure 11-21. EDMA Prioritization

11.3.14.1 Channel Priority

The EDMA event registers EDMA_TPCC_ER and EDMA_TPCC_ERH capture up to 64 events, the QDMA event register EDMA_TPCC_QER captures QDMA events for all QDMA channels therefore, it is possible for events to occur simultaneously on the DMA/QDMA event inputs. For events arriving simultaneously, the event associated with the lowest channel number is prioritized for submission to the event queues (for DMA events, channel 0 has the highest priority and channel 63 has the lowest priority, for QDMA events, channel 0 has the highest priority and channel 7 has the lowest priority). This mechanism only sorts simultaneous events for submission to the event queues.

If a DMA and QDMA event occurs simultaneously, the DMA event always has prioritization against the QDMA event for submission to the event queues.

11.3.14.2 Trigger Source Priority

If a EDMA channel is associated with more than one trigger source (event trigger, manual trigger, and chain trigger), and if multiple events are set simultaneously for the same channel (EDMA_TPCC_ER[31:0] $E_n = 1$, EDMA_TPCC_ESR[31:0] $E_n = 1$, EDMA_TPCC_CER[31:0] $E_n = 1$), then the EDMA_TPCC always services these events in the following priority order: event trigger (via EDMA_TPCC_ER) is higher priority than chain trigger (via EDMA_TPCC_CER) and chain trigger is higher priority than manual trigger (via EDMA_TPCC_ESR).

This implies that if for channel 0, both EDMA_TPCC_ER[0] $E_0 = 1$ and EDMA_TPCC_CER[0] $E_0 = 1$ at the same time, then the EDMA_TPCC_ER[0] E_0 event is always queued before the EDMA_TPCC_CER[0] E_0 event.

11.3.14.3 Dequeue Priority

The priority of the associated transfer request (TR) is further mitigated by which event queue is being used for event submission (dictated by EDMA_TPCC_DMAQNUMN_k and EDMA_TPCC_QDMAQNUM). For submission of a TR to the transfer request, events need to be de-queued from the event queues. Queue 0 has the highest dequeue priority and queue 1 the lowest.

11.3.15 Emulation Considerations

During debug when using the emulator, the CPU(s) may be halted on an execute packet boundary for single-stepping, benchmarking, profiling, or other debug purposes. During an emulation halt, the EDMA channel controller and transfer controller operations continue. Events continue to be latched and processed and transfer requests continue to be submitted and serviced.

Since EDMA is involved in servicing multiple controller and target peripherals, it is not feasible to have an independent behavior of the EDMA for emulation halts. EDMA functionality would be coupled with the peripherals it is servicing, which might have different behavior during emulation halts.

11.4 EDMA Transfer Examples

The EDMA channel controller performs a variety of transfers depending on the parameter configuration. The following sections provide a description and PaRAM configuration for some typical use case scenarios.

11.4.1 Block Move Example

The most basic transfer performed by the EDMA is a block move. During device operation it is often necessary to transfer a block of data from one location to another, usually between on-chip and off-chip memory.

In this example, a section of data is to be copied from external memory to internal L2 SRAM as shown in [Figure 11-22](#).

The source address for the transfer is set to the start of the data block in external memory, and the destination address is set to the start of the data block in L2. If the data block is less than 64K bytes, the PaRAM configuration shown in [Figure 11-23](#) holds true with the synchronization type set to A-synchronized and indexes cleared to 0. If the amount of data is greater than 64K bytes, EDMA_TPCC_ABCNT_n[31:16] BCNT and the B-indexes need to be set appropriately with the synchronization type set to AB-synchronized. The EDMA_TPCC_OPT_n[3] STATIC bit is set to prevent linking.

This transfer example may also be set up using QDMA. For successive transfer submissions, of a similar nature, the number of cycles used to submit the transfer are fewer depending on the number of changing transfer parameters. The QDMA trigger word must be programmed to be the highest numbered offset in the PaRAM set that undergoes change.

[Figure 11-23](#) shows the parameters Block Move transfer.

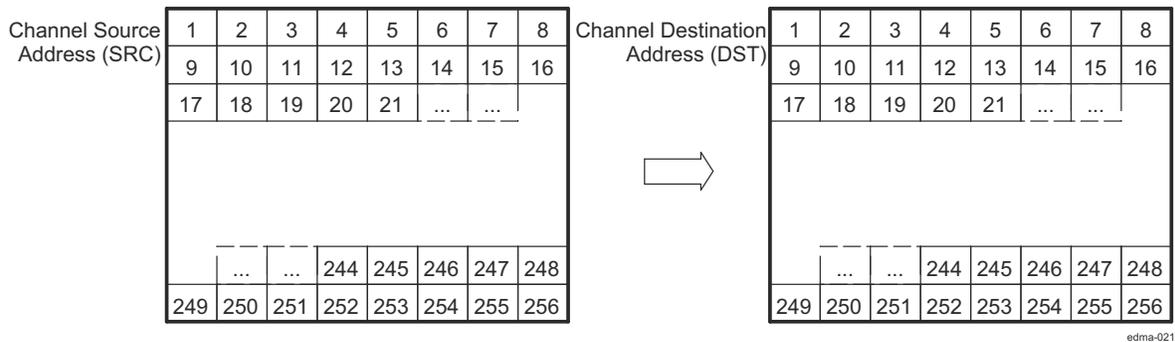

Figure 11-22. Block Move Example

edma-021

Figure 11-23. Block Move Example PaRAM Configuration

(a) EDMA Parameters

Parameter Contents		Parameter	
0010 0008h		Channel Options Parameter (OPT)	
Channel Source Address (SRC)		Channel Source Address (SRC)	
0001h	0100h	Count for 2nd Dimension (BCNT)	Count for 1st Dimension (ACNT)
Channel Destination Address (DST)		Channel Destination Address (DST)	
0000h	0000h	Destination BCNT Index (DBIDX)	Source BCNT Index (SBIDX)
0000h	FFFFh	BCNT Reload (BCNTRLD)	Link Address (LINK)
0000h	0000h	Destination CCNT Index (DCIDX)	Source CCNT Index (SCIDX)
0000h	0001h	Reserved	Count for 3rd Dimension (CCNT)

(b) Channel Options Parameter (OPT) Content

- EDMA_TPCC_OPT_n[3] STATIC = 0x1
- EDMA_TPCC_OPT_n[20] TCINTEN = 0x1

11.4.2 Subframe Extraction Example

The EDMA can efficiently extract a small frame of data from a larger frame of data. By performing a 2D-to-1D transfer, the EDMA retrieves a portion of data for the CPU to process. In this example, a 640 × 480-pixel frame of video data is stored in external memory. Each pixel is represented by a 16-bit halfword. The CPU extracts a 16 × 12-pixel subframe of the image for processing. To facilitate more efficient processing time by the CPU, the EDMA places the subframe in internal L2 SRAM. Figure 11-24 shows the transfer of a subframe from external memory to L2.

The same PaRAM entry options are used for QDMA channels, as well as DMA channels. The EDMA_TPCC_OPT_n[3] STATIC bit is set to prevent linking. For successive transfers, only changed parameters need to be programmed before triggering the channel.

Figure 11-25 shows the parameters for Subframe Extraction transfer.

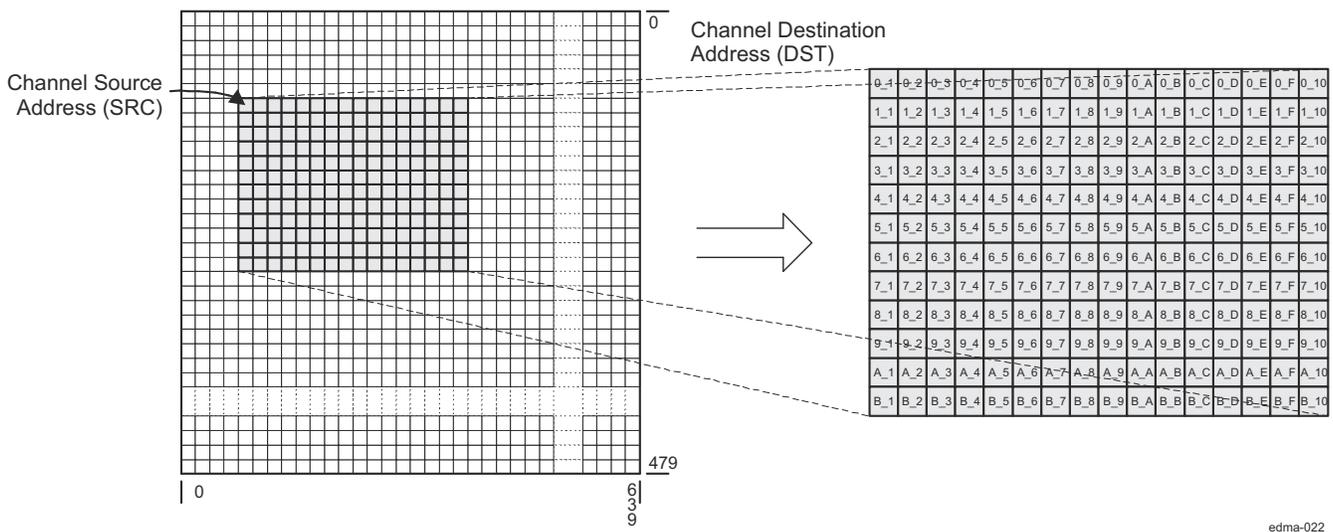

Figure 11-24. Subframe Extraction Transfer

Figure 11-25. Subframe Extraction Example PaRAM Configuration

(a) EDMA Parameters

Parameter Contents		Parameter	
0010 000Ch		Channel Options Parameter (OPT)	
Channel Source Address (SRC)		Channel Source Address (SRC)	
000Ch	0020h	Count for 2nd Dimension (BCNT)	Count for 1st Dimension (ACNT)
Channel Destination Address (DST)		Channel Destination Address (DST)	
0020h	0500h	Destination BCNT Index (DBIDX)	Source BCNT Index (SBIDX)
0000h	FFFFh	BCNT Reload (BCNTRLD)	Link Address (LINK)
0000h	0000h	Destination CCNT Index (DCIDX)	Source CCNT Index (SCIDX)
0000h	0001h	Reserved	Count for 3rd Dimension (CCNT)

(b) Channel Options Parameter (OPT) Content

- EDMA_TPCC_OPT_n[2] SYNCDIM = 0x1
- EDMA_TPCC_OPT_n[3] STATIC = 0x1
- EDMA_TPCC_OPT_n[20] TCINTEN = 0x1

11.4.3 Data Sorting Example

Many applications require the use of multiple data arrays, it is often desirable to have the arrays arranged such that the first elements of each array are adjacent, the second elements are adjacent, and so on. Often this is not how the data is presented to the device. Either data is transferred via a peripheral with the data arrays arriving one after the other or the arrays are located in memory with each array occupying a portion of contiguous memory spaces. For these instances, the EDMA can reorganize the data into the desired format.

To determine the parameter set values, the following need to be considered:

- ACNT - Program this to be the size in bytes of an element.
- BCNT - Program this to be the number of elements in a frame.
- CCNT - Program this to be the number of frames.
- SBIDX - Program this to be the size of the element or ACNT.
- DBIDX - CCNT × ACNT
- SCIDX - ACNT × BCNT
- DCIDX - ACNT

The synchronization type needs to be AB-synchronized and the EDMA_TPCC_OPT_n[3] STATIC bit is 0 to allow updates to the parameter set. It is advised to use normal EDMA channels for sorting.

It is not possible to sort this with a single trigger event. Instead, the channel can be programmed to be chained to itself. After BCNT elements get sorted, intermediate chaining could be used to trigger the channel again causing the transfer of the next BCNT elements and so on. [Figure 11-27](#) shows the parameter set programming for this transfer, assuming channel 0 and an element size of 4 bytes.

[Figure 11-26](#) shows the Data Sorting transfer

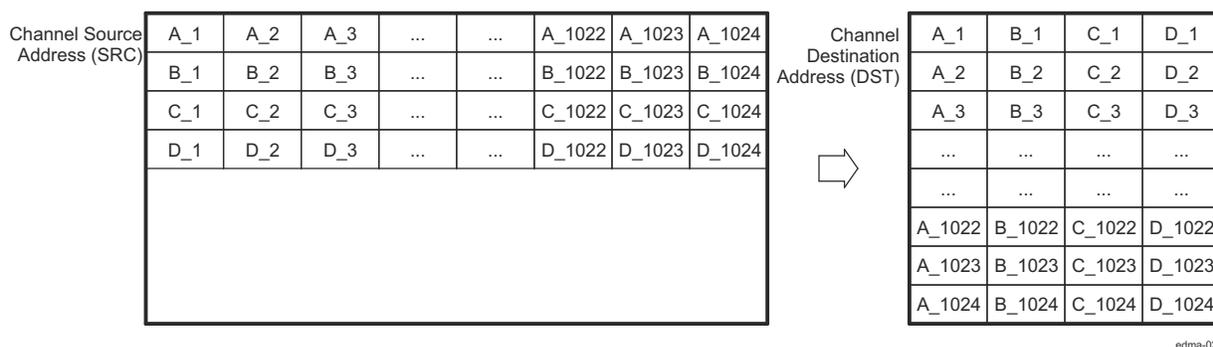

Figure 11-26. Data Sorting Example

Figure 11-27. Data Sorting Example PaRAM Configuration

(a) EDMA Parameters

Parameter Contents		Parameter	
0090 0004h		Channel Options Parameter (OPT)	
Channel Source Address (SRC)		Channel Source Address (SRC)	
0400h	0004h	Count for 2nd Dimension (BCNT)	Count for 1st Dimension (ACNT)
Channel Destination Address (DST)		Channel Destination Address (DST)	
0010h	0001h	Destination BCNT Index (DSTBIDX)	Source BCNT Index (SRCBIDX)
0000h	FFFFh	BCNT Reload (BCNTRLD)	Link Address (LINK)
0001h	1000h	Destination CCNT Index (DSTCIDX)	Source CCNT Index (SRCCIDX)
0000h	0004h	Reserved	Count for 3rd Dimension (CCNT)

(b) Channel Options Parameter (OPT) Content

- EDMA_TPCC_OPT_n[2] SYNCDIM = 0x1
- EDMA_TPCC_OPT_n[20] TCINTEN = 0x1
- EDMA_TPCC_OPT_n[23] ITCCHEN = 0x1

11.4.4 Setting Up an EDMA Transfer

The following list provides a quick guide for the typical steps involved in setting up a transfer.

1. Initiating a DMA/QDMA channel
 - a. Determine the type of channel (QDMA or DMA) to be used.
 - b. Channel mapping
 - i. If using a QDMA channel, program the EDMA_TPCC_QCHMAPN_j with the parameter set number to which the channel maps and the trigger word.
 - ii. If using a DMA channel, program the EDMA_TPCC_DCHMAPN_m with the parameter set number to which the channel maps.
 - c. If the channel is being used in the context of a shadow region, ensure the EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k for the region is properly set up to allow read write accesses to bits in the event registers and interrupt registers in the Shadow region memory map. The subsequent steps in this process should be done using the respective shadow region registers. (Shadow region descriptions and usage are provided in [Section 11.3.7.1.](#))
 - d. Determine the type of triggering used.
 - i. If external events are used for triggering (DMA channels), enable the respective event in EDMA_TPCC_EER / EDMA_TPCC_EERH by writing into EDMA_TPCC_EESR / EDMA_TPCC_EESRH.
 - ii. If QDMA Channel is used, enable the channel in EDMA_TPCC_QEER by writing into EDMA_TPCC_QEESR.
 - e. Queue setup
 - i. If a QDMA channel is used, set up the EDMA_TPCC_QDMAQNUM to map the channel to the respective event queue.
 - ii. If a DMA channel is used, set up the EDMA_TPCC_DMAQNUMN_k to map the event to the respective event queue.

2. Parameter set setup

- a. Program the PaRAM set number associated with the channel. Note that

Note

If it is a QDMA channel, the PaPARAM entry that is configured as trigger word is written to last. Alternatively, enable the QDMA channel (step 1-b-ii above) just before the write to the trigger word.

3. Interrupt setup

- a. Enable the interrupt in the EDMA_TPCC_IER / EDMA_TPCC_IERH by writing into EDMA_TPCC_IESR / EDMA_TPCC_IESRH.
- b. Ensure the EDMA_TPCC completion interrupt (this refers to either the Global interrupt or the shadow region interrupt) is enabled properly in the Device Interrupt controller.
- c. Set up the interrupt controller properly to receive the expected EDMA interrupt.

4. Initiate transfer

- a. This step is highly dependent on the event trigger source:
 - i. If the source is an external event coming from a peripheral, the peripheral will be enabled to start generating relevant EDMA events that can be latched to the EDMA_TPCC_ER transfer.
 - ii. For QDMA events, writes to the trigger word (step 2-a above) will initiate the transfer.
 - iii. Manually triggered transfers will be initiated by writes to the Event Set Registers EDMA_TPCC_ESR / EDMA_TPCC_ESRH.
 - iv. Chained-trigger events initiate when a previous transfer returns a transfer completion code equal to the chained channel number.

5. Wait for completion

- a. If the interrupts are enabled as mentioned in step 3 above, then the EDMA_TPCC will generate a completion interrupt to the CPU whenever transfer completion results in setting the corresponding bits in the interrupt pending register EDMA_TPCC_IPR / EDMA_TPCC_IPRH. The set bits must be cleared

- in the EDMA_TPCC_IPR / EDMA_TPCC_IPRH by writing to corresponding bit in EDMA_TPCC_ICR / EDMA_TPCC_ICRH.
- b. If polling for completion (interrupts not enabled in the device controller), then the application code can wait on the expected bits to be set in the EDMA_TPCC_IPR / EDMA_TPCC_IPRH. Again, the set bits in the EDMA_TPCC_IPR / EDMA_TPCC_IPRH must be manually cleared via EDMA_TPCC_ICR / EDMA_TPCC_ICRH before the next set of transfers is performed for the same transfer completion code values.

11.5 EDMA Debug Checklist and Programming Tips

This section lists some tips to keep in mind while debugging applications using the EDMA controller.

11.5.1 EDMA Debug Checklist

Table 11-27 provides some common issues and their probable causes and resolutions.

Table 11-27. Debug Checklist

Issue	Description/Solution
The transfer associated with the channel does not happen. The channel does not get serviced.	The EDMA_TPCC may not service a transfer request, even though the associated PaRAM set is programmed appropriately. Check for the following: 1) Verify that events are enabled, i.e., if an external/peripheral event is latched in Event Registers EDMA_TPCC_ER / EDMA_TPCC_ERH, check that the event is enabled in the Event Enable Registers EDMA_TPCC_EER / EDMA_TPCC_EERH. Similarly, for QDMA channels, check that QDMA events are appropriately enabled in the QDMA Event Enable Register EDMA_TPCC_QEER. 2) Verify that the DMA or QDMA Secondary Event Register EDMA_TPCC_SER / EDMA_TPCC_SERH / EDMA_TPCC_QSER bits corresponding to the particular event or channel are not set.
The Secondary Event Registers bits are set, not allowing additional transfers to occur on a channel.	It is possible that a trigger event was received when the parameter set associated with the channel/event was a NULL set for a previous transfer on the channel. This is typical in two cases: 1) QDMA channels: Typically if the parameter set is non-static and expected to be terminated by a NULL set (i.e., EDMA_TPCC_OPT_n[3] STATIC = 0x0, EDMA_TPCC_LNK_n[15:0] LINK = 0xFFFF), the parameter set is updated with a NULL set after submission of the last TR. Because QDMA channels are auto-triggered, this update caused the generation of an event. An event generated for a NULL set causes an error condition and results in setting the bits corresponding to the QDMA channel in the EDMA_TPCC_QEMR and EDMA_TPCC_QSER. This will disable further prioritization of the channel. 2) DMA channels used in a continuous mode: The peripheral may be set up to continuously generate infinite events (for instance, in case of McASP, every time the data shifts out from the DXR register, it generates an XEVT). The parameter set may be programmed to expect only a finite number of events and to be terminated by a NULL link. After the expected number of events, the parameter set is reloaded with a NULL parameter set. Because the peripheral will generate additional events, an error condition is set in the EDMA_TPCC_SER[31:0] En and EDMA_TPCC_EMR[31:0] En set, preventing further event prioritization. Check the number of events received is limited to the expected number of events for which the parameter set is programmed, or check the bits corresponding to particular channel or event are not set in the Secondary event registers (EDMA_TPCC_SER / EDMA_TPCC_SERH / EDMA_TPCC_QSER) and Event Missed Registers (EDMA_TPCC_EMR / EDMA_TPCC_EMRH / EDMA_TPCC_QEMR) before trying to perform subsequent transfers for the event/channel.

Table 11-27. Debug Checklist (continued)

Issue	Description/Solution
<p>Completion interrupts are not asserted, or no further interrupts are received after the first completion interrupt.</p>	<p>Check the following:</p> <ol style="list-style-type: none"> 1) The interrupt generation is enabled in the EDMA_TPCC_OPT_n of the associated PaRAM set (EDMA_TPCC_OPT_n[20] TCINTEN = 0x1 and/or EDMA_TPCC_OPT_n[20] ITCINTEN = 0x1). 2) The interrupts are enabled in the EDMA Channel Controller, via the Interrupt Enable Registers (EDMA_TPCC_IER / EDMA_TPCC_IERH). 3) The corresponding interrupts are enabled in the device interrupt controller. 4) The set interrupts are cleared in the interrupt pending registers (EDMA_TPCC_IPR / EDMA_TPCC_IPRH) before exiting the transfer completion interrupt service routine (ISR). See Section 11.3.9.1.2 Clearing Transfer Completion Interrupts for details on writing EDMA ISRs. 5) If working with shadow region interrupts, make sure that the DMA Region Access registers (EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k) are set up properly, because the EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k registers act as secondary enables for shadow region completion interrupts, along with the EDMA_TPCC_IER / EDMA_TPCC_IERH registers. <p>If working with shadow region interrupts, make sure that the bits corresponding to the transfer completion code EDMA_TPCC_OPT_n[17:12] TCC value are also enabled in the EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k registers. For instance, if the PaRAM set associated with Channel 0 returns a completion code of 63 EDMA_TPCC_OPT_n[17:12] TCC = 63, ensure that EDMA_TPCC_DRAEHM_k[31] E63 is also set for a shadow region completion interrupt because the interrupt pending register bit set will be EDMA_TPCC_IPRH[31] I63 (not EDMA_TPCC_IPR[0] I0).</p>

11.5.2 EDMA Programming Tips

- For several registers, the setting and clearing of bits needs to be done via separate dedicated registers. For example, the Event Register (EDMA_TPCC_ER / EDMA_TPCC_ERH) can only be cleared by writing a 1 to the corresponding bits in the Event Clear Registers (EDMA_TPCC_ECR / EDMA_TPCC_ECRH). Similarly, the Event Enable Register (EDMA_TPCC_EER / EDMA_TPCC_EERH) bits can only be set with writing of 0x1 to the Event Enable Set Registers (EDMA_TPCC_EESR / EDMA_TPCC_EESRH) and cleared with writing of 0x1 to the corresponding bits in the Event Enable Clear Register (EDMA_TPCC_EECSR / EDMA_TPCC_EECSRH).
- Writes to the shadow region memory maps are governed by region access registers (EDMA_TPCC_DRAE / EDMA_TPCC_DRAEHM_k / EDMA_TPCC_QRAEN_k). If the appropriate channels are not enabled in these registers, read/write access to the shadow region memory map is not enabled.
- When working with shadow region completion interrupts, ensure that the DMA Region Access Registers (EDMA_TPCC_DRAEM_k / EDMA_TPCC_DRAEHM_k) for every region are set in a mutually exclusive way (unless it is a requirement for an application). If there is an overlap in the allocated channels and transfer completion codes (setting of Interrupt Pending Register bits) in the region resource allocation, it results in multiple shadow region completion interrupts.
For example, if EDMA_TPCC_DRAEM_k.DRAEM_0[0] E0 and EDMA_TPCC_DRAEM_k.DRAEM_1[0] E0 are both set, then on completion of a transfer that returns a TCC = 0x0, they will generate both shadow region 0 and 1 completion interrupts.
- While programming a non-dummy parameter set, ensure the EDMA_TPCC_CCNT_n[15:0] CCNT is not left to zero.
- Enable the EDMA_TPCC error interrupt in the device controller and attach an interrupt service routine (ISR) to ensure that error conditions are not missed in an application and are appropriately addressed with the ISR.
- Depending on the application, it can want to break large transfers into smaller transfers and use self-chaining to prevent starvation of other events in an event queue.
- In applications where a large transfer is broken into sets of small transfers using chaining or other methods, it chooses to use the early chaining option to reduce the time between the sets of transfers and increase the throughput.
However, keep in mind that with early completion, all data might have not been received at the end point when completion is reported because the EDMA_TPCC internally signals completion when the TR is submitted to the EDMA_TPTC, potentially before any data has been transferred.
- The event queue entries can be observed to determine the last few events if there is a system failure (provided the entries were not bypassed).

11.8.1.1.1 PID Register (Offset = 0h) [reset = 4001AB00h]

PID is shown in [Figure 11-28](#) and described in [Table 11-34](#).

Return to the [Table 11-33](#).

Peripheral ID Register

Figure 11-28. PID Register

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SCHEME		RES1		FUNC											
R-1h		R-0h		R-1h											
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RTL				MAJOR			CUSTOM			MINOR					
R-15h				R-3h			R-0h			R-0h					

Table 11-34. PID Register Field Descriptions

Bit	Field	Type	Reset	Description
31-30	SCHEME	R	1h	PID Scheme: Used to distinguish between old ID scheme and current. Spare bit to encode future schemes EDMA uses 'new scheme' indicated with value of 0x1.
29-28	RES1	R	0h	RESERVE FIELD
27-16	FUNC	R	1h	Function indicates a software compatible module family.
15-11	RTL	R	15h	RTL Version
10-8	MAJOR	R	3h	Major Revision
7-6	CUSTOM	R	0h	Custom revision field: Not used on this version of EDMA.
5-0	MINOR	R	0h	Minor Revision

11.8.1.1.2 CCCFG Register (Offset = 4h) [reset = 00213445h]

 CCCFG is shown in [Figure 11-29](#) and described in [Table 11-35](#).

 Return to the [Table 11-33](#).

CC Configuration Register

Figure 11-29. CCCFG Register

31	30	29	28	27	26	25	24

Bit	Field	Type	Reset	Description
31-7	RES29	R	0h	RESERVE FIELD
6-4	PRIQ1	R/W	0h	Priority Level for Queue 1 Dictates the priority level used for the OPTIONS field programming for Qn TRs. Sets the priority used for TC read and write commands.
3	RES30	R	0h	RESERVE FIELD
2-0	PRIQ0	R/W	0h	Priority Level for Queue 0 Dictates the priority level used for the OPTIONS field programming for Qn TRs. Sets the priority used for TC read and write commands.

11.8.1.1.8 EMR Register (Offset = 300h) [reset = 0h]

EMR is shown in [Figure 11-35](#) and described in [Table 11-41](#).

Return to the [Table 11-33](#).

Event Missed Register: The Event Missed register is set if 2 events are received without the first event being cleared or if a Null TR is serviced. Chained events (CER) Set Events (ESR) and normal events (ER) are treated individually. If any bit in the EMR register is set (and all errors (including QEMR/CCERR) were previously clear) then an error will be signaled with TPCC error interrupt.

11.8.1.1.12 QEMR Register (Offset = 310h) [reset = 0h]

QEMR is shown in [Figure 11-39](#) and described in [Table 11-45](#).

Return to the [Table 11-33](#).

QDMA Event Missed Register: The QDMA Event Missed register is set if 2 QDMA events are detected without the first event being cleared or if a Null TR is serviced.. If any bit in the QEMR register is set (and all errors (including EMR/CCERR) were previously clear) then an error will be signaled with TPCC error interrupt.

Bit	Field	Type	Reset	Description
31-17	RES33	R	0h	RESERVE FIELD
16	TCERR	R	0h	Transfer Completion Code Error: TCCERR = 0 : Total number of allowed TCCs outstanding has not been reached. TCCERR = 1 : Total number of allowed TCCs has been reached. TCCERR can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors were previously clear) then an error will be signaled with TPCC error interrupt.
15-8	RES34	R	0h	RESERVE FIELD
7	QTHRXC7	R	0h	Queue Threshold Error for Q7: QTHRXC7 = 0 : Watermark/ threshold has not been exceeded. QTHRXC7 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXC7 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
6	QTHRXC6	R	0h	Queue Threshold Error for Q6: QTHRXC6 = 0 : Watermark/ threshold has not been exceeded. QTHRXC6 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRXC6 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.

Table 11-47. CCERR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	QTHRCD5	R	0h	Queue Threshold Error for Q5: QTHRCD5 = 0 : Watermark/ threshold has not been exceeded. QTHRCD5 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRCD5 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
4	QTHRCD4	R	0h	Queue Threshold Error for Q4: QTHRCD4 = 0 : Watermark/ threshold has not been exceeded. QTHRCD4 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRCD4 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
3	QTHRCD3	R	0h	Queue Threshold Error for Q3: QTHRCD3 = 0 : Watermark/ threshold has not been exceeded. QTHRCD3 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRCD3 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
2	QTHRCD2	R	0h	Queue Threshold Error for Q2: QTHRCD2 = 0 : Watermark/ threshold has not been exceeded. QTHRCD2 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRCD2 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
1	QTHRCD1	R	0h	Queue Threshold Error for Q1: QTHRCD1 = 0 : Watermark/ threshold has not been exceeded. QTHRCD1 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRCD1 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.
0	QTHRCD0	R	0h	Queue Threshold Error for Q0: QTHRCD0 = 0 : Watermark/ threshold has not been exceeded. QTHRCD0 = 1 : Watermark/ threshold has been exceeded. CCERR.QTHRCD0 can be cleared by writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set (and all errors (including EMR/QEMR) were previously clear) then an error will be signaled with the TPCC error interrupt.

11.8.1.1.15 CCERRCLR Register (Offset = 31Ch) [reset = 0h]

 CCERRCLR is shown in [Figure 11-42](#) and described in [Table 11-48](#).

 Return to the [Table 11-33](#).

Table 11-71. CCSTAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13-8	COMPACTV	R	0h	Completion Request Active: Counter that tracks the total number of completion requests submitted to the TC. The counter increments when a TR is submitted with TCINTEN or TCCHEN set to '1'. The counter decrements for every valid completion code received from any of the external TCs. The CC will not service new TRs if COMPACTV count is already at the limit. COMPACTV = 0 : No completion requests outstanding. COMPACTV = 1 : Total of '1' completion request outstanding. ... COMPACTV = 63 : Total of 63 completion requests are outstanding. No additional TRs will be submitted until count is less than 63.
7-5	RES63	R	0h	RESERVE FIELD
4	ACTV	R	0h	Channel Controller Active: Channel Controller Active is a logical-OR of each of the ACTV signals. The ACTV bit must remain high through the life of a TR. ACTV = 0 : Channel is idle. ACTV = 1 : Channel is busy.
3	RES64	R	0h	RESERVE FIELD
2	TRACTV	R	0h	Transfer Request Active: TRACTV = 0 : Transfer Request processing/submission logic is inactive. TRACTV = 1 : Transfer Request processing/submission logic is active.
1	QEVACTV	R	0h	QDMA Event Active: QEVACTV = 0 : No enabled QDMA Events are active within the CC. QEVACTV = 1 : At least one enabled DMA Event (ER & EER ESR CER) is active within the CC.
0	EVTACTV	R	0h	DMA Event Active: EVTACTV = 0 : No enabled DMA Events are active within the CC. EVTACTV = 1 : At least one enabled DMA Event (ER & EER ESR CER) is active within the CC.

11.8.1.1.39 AETCTL Register (Offset = 700h) [reset = 0h]

 AETCTL is shown in [Figure 11-66](#) and described in [Table 11-72](#).

 Return to the [Table 11-33](#).

11.8.1.1.42 ER Register (Offset = 1000h) [reset = 0h]

ER is shown in [Figure 11-69](#) and described in [Table 11-75](#).

Return to the [Table 11-33](#).

Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

11.8.1.1.48 CER Register (Offset = 1018h) [reset = 0h]

CER is shown in [Figure 11-75](#) and described in [Table 11-81](#).

Return to the [Table 11-33](#).

Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

11.8.1.1.49 CERH Register (Offset = 101Ch) [reset = 0h]

CERH is shown in [Figure 11-76](#) and described in [Table 11-82](#).

Return to the [Table 11-33](#).

Chained Event Register (High Part): If CERH.En bit is set (regardless of state of EERH.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CERH.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CERH.En bit is cleared when the corresponding event is prioritized and serviced. If the CERH.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CERH.En cannot be set or cleared via software.

11.8.1.1.50 EER Register (Offset = 1020h) [reset = 0h]

EER is shown in [Figure 11-77](#) and described in [Table 11-83](#).

Return to the [Table 11-33](#).

Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via `tpcc_eventN_pi`). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' ER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

11.8.1.1.56 SER Register (Offset = 1038h) [reset = 0h]

SER is shown in [Figure 11-83](#) and described in [Table 11-89](#).

Return to the [Table 11-33](#).

Secondary Event Register: The secondary event register is used along with the Event Register (ER) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

Table 11-103. IEVAL Register Field Descriptions

Bit	Field	Type	Reset	Description
31-2	RES69	R	0h	RESERVE FIELD
1	SET	W	0h	Interrupt Set: CPU write of '1' to the SETn bit causes the tpcc_intN output signal to be pulsed egardless of state of interrupts enable (IERn) and status (IPRn). CPU write of '0' has no effect.
0	EVAL	W	0h	Interrupt Evaluate: CPU write of '1' to the EVALn bit causes the tpcc_intN output signal to be pulsed if any enabled interrupts (IERn) are still pending (IPRn). CPU write of '0' has no effect..

11.8.1.1.71 QER Register (Offset = 1080h) [reset = 0h]

QER is shown in [Figure 11-98](#) and described in [Table 11-104](#).

Return to the [Table 11-33](#).

QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

0	E0	R	0h	Event #0

11.8.1.1.72 QEER Register (Offset = 1084h) [reset = 0h]

QEER is shown in [Figure 11-99](#) and described in [Table 11-105](#).

Return to the [Table 11-33](#).

QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/latched in QER.En.

11.8.1.1.75 QSER Register (Offset = 1090h) [reset = 0h]

QSER is shown in [Figure 11-102](#) and described in [Table 11-108](#).

Return to the [Table 11-33](#).

QDMA Secondary Event Register: The QDMA secondary event register is used along with the QDMA Event Register (QER) to provide information on the state of a QDMA Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

Figure 11-102. QSER Register

11.8.1.1.76 QSECR Register (Offset = 1094h) [reset = 0h]

QSECR is shown in [Figure 11-103](#) and described in [Table 11-109](#).

Return to the [Table 11-33](#).

QDMA Secondary Event Clear Register: The secondary event clear register is used to clear the status of the QSER and QER register (note that this is slightly different than the SER operation which does not clear the ER.En register). CPU write of '1' to the QSECR.En bit clears the QSER.En and QER.En register fields. CPU write of '0' has no effect..

11.8.1.1.77 ER_RN Register (Offset = 2000h) [reset = 0h]

ER_RN is shown in [Figure 11-104](#) and described in [Table 11-110](#).

Return to the [Table 11-33](#).

Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

11.8.1.1.83 CER_RN Register (Offset = 2018h) [reset = 0h]

CER_RN is shown in [Figure 11-110](#) and described in [Table 11-116](#).

Return to the [Table 11-33](#).

Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

11.8.1.1.85 EER_RN Register (Offset = 2020h) [reset = 0h]

EER_RN is shown in [Figure 11-112](#) and described in [Table 11-118](#).

Return to the [Table 11-33](#).

Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

11.8.1.1.91 SER_RN Register (Offset = 2038h) [reset = 0h]

SER_RN is shown in [Figure 11-118](#) and described in [Table 11-124](#).

Return to the [Table 11-33](#).

Secondary Event Register: The secondary event register is used along with the Event Register (ER) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.
