

## DRV5055-Q1 Automotive Ratiometric Linear Hall Effect Sensor

### 1 Features

- Ratiometric Linear Hall Effect Magnetic Sensor
- Operates From 3.3-V and 5-V Power Supplies
- Analog Output With  $V_{CC} / 2$  Quiescent Offset
- Magnetic Sensitivity Options (At  $V_{CC} = 5\text{ V}$ ):
  - A1: 100 mV/mT,  $\pm 21\text{-mT}$  Range
  - A2: 50 mV/mT,  $\pm 42\text{-mT}$  Range
  - A3: 25 mV/mT,  $\pm 85\text{-mT}$  Range
  - A4: 12.5 mV/mT,  $\pm 169\text{-mT}$  Range
  - A5:  $-100\text{ mV/mT}$ ,  $\pm 21\text{-mT}$  Range
- Fast 20-kHz Sensing Bandwidth
- Low-Noise Output With  $\pm 1\text{-mA}$  Drive
- Compensation For Magnet Temperature Drift
- AEC-Q100 Qualified for Automotive Applications:
  - Temperature Grade 0:  $-40^{\circ}\text{C}$  to  $150^{\circ}\text{C}$
- Standard Industry Packages:
  - Surface-Mount SOT-23
  - Through-Hole TO-92

### 2 Applications

- Automotive Position Sensing
- Brake, Acceleration, Clutch Pedals
- Torque Sensors, Gear Shifters
- Throttle Position, Height Leveling
- Powertrain and Transmission Components
- Absolute Angle Encoding
- Current Sensing

### 3 Description

The DRV5055-Q1 is a linear Hall effect sensor that responds proportionally to magnetic flux density. The device can be used for accurate position sensing in a wide range of applications.

The device operates from 3.3-V or 5-V power supplies. When no magnetic field is present, the analog output drives half of  $V_{CC}$ . The output changes linearly with the applied magnetic flux density, and five sensitivity options enable maximal output voltage swing based on the required sensing range. North and south magnetic poles produce unique voltages.

Magnetic flux perpendicular to the top of the package is sensed, and the two package options provide different sensing directions.

The device uses a ratiometric architecture that can eliminate error from  $V_{CC}$  tolerance when the external analog-to-digital converter (ADC) uses the same  $V_{CC}$  for its reference. Additionally, the device features magnet temperature compensation to counteract how magnets drift for linear performance across a wide  $-40^{\circ}\text{C}$  to  $+150^{\circ}\text{C}$  temperature range.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DRV5055-Q1	SOT-23 (3)	2.92 mm × 1.30 mm
	TO-92 (3)	4.00 mm × 3.15 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 5 Pin Configuration and Functions

### Pin Functions

PIN			I/O	DESCRIPTION
NAME	SOT-23	TO-92		
V <sub>CC</sub>	1	1	—	Power supply. TI recommends connecting this pin to a ceramic capacitor to ground with a value of at least 0.01 $\mu$ F.
OUT	2	3	O	Analog output
GND	3	2	—	Ground reference

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Power supply voltage	V <sub>CC</sub>	−0.3	7	V
Output voltage	OUT	−0.3	V <sub>CC</sub> + 0.3	V
Magnetic flux density, B <sub>MAX</sub>		Unlimited		T
Operating junction temperature, T <sub>J</sub>		−40	170	°C
Storage temperature, T <sub>stg</sub>		−65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

## DRV5055-Q1

SBAS639C –OCTOBER 2017–REVISED JULY 2018

www.ti.com

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per AEC Q100-002 <sup>(1)</sup>	±2500
		Charged device model (CDM), per AEC Q100-011	±750
			V

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V <sub>CC</sub>	Power-supply voltage <sup>(1)</sup>	3	3.63	V
		4.5	5.5	
I <sub>O</sub>	Output continuous current	–1	1	mA
T <sub>A</sub>	Operating ambient temperature <sup>(2)</sup>	–40	150	°C

(1) There are two isolated operating V<sub>CC</sub> ranges. For more information see the [Operating V<sub>CC</sub> Ranges](#) section.

(2) Power dissipation and thermal limits must be observed.

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		DRV5055-Q1		UNIT
		SOT-23 (DBZ)	TO-92 (LPG)	
		3 PINS	3 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	170	121	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	66	67	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	49	97	°C/W
Y <sub>JT</sub>	Junction-to-top characterization parameter	1.7	7.6	°C/W
Y <sub>JB</sub>	Junction-to-board characterization parameter	48	97	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

### 6.5 Electrical Characteristics

for V<sub>CC</sub> = 3 V to 3.63 V and 4.5 V to 5.5 V, over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS <sup>(1)</sup>	MIN	TYP	MAX	UNIT
I <sub>CC</sub>	Operating supply current		6	10	mA
t <sub>ON</sub>	Power-on time (see <a href="#">Figure 18</a> )	B = 0 mT, no load on OUT		175	330
f <sub>BW</sub>	Sensing bandwidth		20		kHz
t <sub>d</sub>	Propagation delay time	From change in B to change in OUT		10	μs
B <sub>ND</sub>	Input-referred RMS noise density	V <sub>CC</sub> = 5 V		130	nT/√Hz
		V <sub>CC</sub> = 3.3 V		215	
B <sub>N</sub>	Input-referred noise	B <sub>ND</sub> × 6.6 × √20 kHz	V <sub>CC</sub> = 5 V	0.12	mT <sub>PP</sub>
			V <sub>CC</sub> = 3.3 V	0.2	
V <sub>N</sub>	Output-referred noise <sup>(2)</sup>	B <sub>N</sub> × S	DRV5055A1, DRV5055A5	12	mV <sub>PP</sub>
			DRV5055A2	6	
			DRV5055A3	3	
			DRV5055A4	1.5	

(1) B is the applied magnetic flux density.

(2) V<sub>N</sub> describes voltage noise on the device output. If the full device bandwidth is not needed, noise can be reduced with an RC filter.

## 6.6 Magnetic Characteristics

for  $V_{CC} = 3\text{ V}$  to  $3.63\text{ V}$  and  $4.5\text{ V}$  to  $5.5\text{ V}$ , over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS <sup>(1)</sup>		MIN	TYP	MAX	UNIT

## 7 Detailed Description

### 7.1 Overview

The DRV5055-Q1 is a 3-pin linear Hall effect sensor with fully integrated signal conditioning, temperature compensation circuits, mechanical stress cancellation, and amplifiers. The device operates from 3.3-V and 5-V ( $\pm 10\%$ ) power supplies, measures magnetic flux density, and outputs a proportional analog voltage that is referenced to  $V_{CC}$ .

### 7.2 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 Magnetic Flux Direction

As shown in Figure 14, the DRV5055-Q1 is sensitive to the magnetic field component that is perpendicular to the top of the package.

**Figure 14. Direction of Sensitivity**

## Feature Description (continued)

Magnetic flux that travels from the bottom to the top of the package is considered positive in this document. This condition exists when a south magnetic pole is near the top (marked-side) of the package. Magnetic flux that travels from the top to the bottom of the package results in negative millitesla values.

**Figure 15. The Flux Direction for Positive B**

### 7.3.2 Magnetic Response

When the DRV5055-Q1 is powered, the DRV5055-Q1 outputs an analog voltage according to [Equation 1](#):

$$V_{OUT} = V_Q + B \times (\text{Sensitivity}_{(25^\circ\text{C})} \times (1 + S_{TC} \times (T_A - 25^\circ\text{C})))$$

where

- $V_Q$  is typically half of  $V_{CC}$
- $B$  is the applied magnetic flux density
- $\text{Sensitivity}_{(25^\circ\text{C})}$  depends on the device option and  $V_{CC}$
- $S_{TC}$  is typically 0.12%/°C
- $T_A$  is the ambient temperature
- $V_{OUT}$  is within the  $V_L$  range

(1)

As an example, consider the DRV5055A3 with  $V_{CC} = 3.3\text{ V}$ , a temperature of  $50^\circ\text{C}$ , and  $67\text{ mT}$  applied. Excluding tolerances,  $V_{OUT} = 1650\text{ mV} + 67\text{ mT} \times (15\text{ mV/mT} \times (1 + 0.0012/^\circ\text{C} \times (50^\circ\text{C} - 25^\circ\text{C}))) = 2685\text{ mV}$ .

### 7.3.3 Sensitivity Linearity

The device produces a linear response when the output voltage is within the specified  $V_L$  range. Outside this range, sensitivity is reduced and nonlinear. [Figure 16](#) and [Figure 17](#) graph the magnetic response.

## Feature Description (continued)

**Figure 16. Magnetic Response of the A1, A2, A3, A4 Versions**

**Figure 17. Magnetic Response of the A5 Version**

[Equation 2](#) calculates parameter  $B_L$ , the minimum linear sensing range at 25°C taking into account the maximum quiescent voltage and sensitivity tolerances.

$$B_{L(MIN)} = \frac{V_{L(MAX)} - V_{Q(MAX)}}{S_{(MAX)}} \quad (2)$$

The parameter  $S_{LE}$  defines linearity error as the difference in sensitivity between any two positive  $B$  values, and any two negative  $B$  values, while the output is within the  $V_L$  range.

The parameter  $S_{SE}$  defines symmetry error as the difference in sensitivity between any positive  $B$  value and the negative  $B$  value of the same magnitude, while the output voltage is within the  $V_L$  range.

### 7.3.4 Ratiometric Architecture

The DRV5055-Q1 has a ratiometric analog architecture that scales the quiescent voltage and sensitivity linearly with the power-supply voltage. For example, the quiescent voltage and sensitivity are 5% higher when  $V_{CC} = 5.25$  V compared to  $V_{CC} = 5$  V. This behavior enables external ADCs to digitize a consistent value regardless of the power-supply voltage tolerance, when the ADC uses  $V_{CC}$  as its reference.

## Feature Description (continued)

**Equation 3** calculates the sensitivity ratiometry error:

$$S_{RE} = 1 - \frac{S_{(V_{CC})} / S_{(5V)}}{V_{CC} / 5V} \text{ for } V_{CC} = 4.5 \text{ V to } 5.5 \text{ V}, \quad S_{RE} = 1 - \frac{S_{(V_{CC})} / S_{(3.3V)}}{V_{CC} / 3.3V} \text{ for } V_{CC} = 3 \text{ V to } 3.63 \text{ V}$$

where

- $S_{(V_{CC})}$  is the sensitivity at the current  $V_{CC}$  voltage
- $S_{(5V)}$  or  $S_{(3.3V)}$  is the sensitivity when  $V_{CC} = 5 \text{ V}$  or  $3.3 \text{ V}$
- $V_{CC}$  is the current  $V_{CC}$  voltage

(3)

**Equation 4** calculates quiescent voltage ratiometry error:

$$V_{QRE} = 1 - \frac{V_{Q(V_{CC})} / V_{Q(5V)}}{V_{CC} / 5V} \text{ for } V_{CC} = 4.5 \text{ V to } 5.5 \text{ V}, \quad V_{QRE} = 1 - \frac{V_{Q(V_{CC})} / V_{Q(3.3V)}}{V_{CC} / 3.3V} \text{ for } V_{CC} = 3 \text{ V to } 3.63 \text{ V}$$

where

- $V_{Q(V_{CC})}$  is the quiescent voltage at the current  $V_{CC}$  voltage
- $V_{Q(5V)}$  or  $V_{Q(3.3V)}$  is the quiescent voltage when  $V_{CC} = 5 \text{ V}$  or  $3.3 \text{ V}$
- $V_{CC}$  is the current  $V_{CC}$  voltage

(4)

### 7.3.5 Operating $V_{CC}$ Ranges

The DRV5055-Q1 has two recommended operating  $V_{CC}$  ranges: 3 V to 3.63 V and 4.5 V to 5.5 V. When  $V_{CC}$  is in the middle region between 3.63 V to 4.5 V, the device continues to function, but sensitivity is less known because there is a crossover threshold near 4 V that adjusts device characteristics.

### 7.3.6 Sensitivity Temperature Compensation for Magnets

Magnets generally produce weaker fields as temperature increases. The DRV5055-Q1 compensates by increasing sensitivity with temperature, as defined by the parameter  $S_{TC}$ . The sensitivity at  $T_A = 125^\circ\text{C}$  is typically 12% higher than at  $T_A = 25^\circ\text{C}$ . The DRV5055A5 absolute value of sensitivity increases with temperature.

### 7.3.7 Power-On Time

After the  $V_{CC}$  voltage is applied, the DRV5055-Q1 requires a short initialization time before the output is set. The parameter  $t_{ON}$  describes the time from when  $V_{CC}$  crosses 3 V until OUT is within 5% of  $V_Q$ , with 0 mT applied and no load attached to OUT. **Figure 18** shows this timing diagram.

**Figure 18.  $t_{ON}$  Definition**

## Feature Description (continued)

### 7.3.8 Hall Element Location

Figure 19 shows the location of the sensing element inside each package option.

Figure 19. Hall Element Location

## 7.4 Device Functional Modes

The DRV5055-Q1 has one mode of operation that applies when the *Recommended Operating Conditions* are met.

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

#### 8.1.1 Selecting the Sensitivity Option

Select the highest DRV5055-Q1 sensitivity option that can measure the required range of magnetic flux density, so that the output voltage swing is maximized.

Larger-sized magnets and farther sensing distances can generally enable better positional accuracy than very small magnets at close distances, because magnetic flux density increases exponentially with the proximity to a magnet. TI created an online tool to help with simple magnet calculations at <http://www.ti.com/product/drv5013>.

#### 8.1.2 Temperature Compensation for Magnets

The DRV5055-Q1 temperature compensation is designed to directly compensate the average drift of neodymium (NdFeB) magnets and partially compensate ferrite magnets. The residual induction ( $B_r$ ) of a magnet typically reduces by 0.12%/°C for NdFeB, and 0.20%/°C for ferrite. When the operating temperature of a system is reduced, temperature drift errors are also reduced.

#### 8.1.3 Adding a Low-Pass Filter

As shown in the [Functional Block Diagram](#), an RC low-pass filter can be added to the device output for the purpose of minimizing voltage noise when the full 20-kHz bandwidth is not needed. This filter can improve the signal-to-noise ratio (SNR) and overall accuracy. Do not connect a capacitor directly to the device output without a resistor in between because doing so can make the output unstable.

#### 8.1.4 Designing for Wire Break Detection

Some systems must detect if interconnect wires become open or shorted. The DRV5055-Q1 can support this function.

First, select a sensitivity option that causes the output voltage to stay within the  $V_L$  range during normal operation. Second, add a pullup resistor between OUT and  $V_{CC}$ . TI recommends a value between 20 k $\Omega$  to 100 k $\Omega$ , and the current through OUT must not exceed the  $I_O$  specification, including current going into an external ADC. Then, if the output voltage is ever measured to be within 150 mV of  $V_{CC}$  or GND, a fault condition exists. [Figure 20](#) shows the circuit, and [Table 1](#) describes fault scenarios.

**Figure 20. Wire Fault Detection Circuit**

**Table 1. Fault Scenarios and the Resulting  $V_{OUT}$**

FAULT SCENARIO	$V_{OUT}$
$V_{CC}$ disconnects	Close to GND
GND disconnects	Close to $V_{CC}$
$V_{CC}$ shorts to OUT	Close to $V_{CC}$
GND shorts to OUT	Close to GND

## 8.2 Typical Application

**Figure 21. Common Magnet Orientation**

### 8.2.1 Design Requirements

Use the parameters listed in [Table 2](#) for this design example.

**Table 2. Design Parameters**

DESIGN PARAMETER	EXAMPLE VALUE
$V_{CC}$	5 V
Magnet	15 × 5 × 5 mm NdFeB
Travel distance	12 mm
Maximum B at the sensor at 25°C	±75 mT
Device option	DRV5055A3

### 8.2.2 Detailed Design Procedure

Linear Hall effect sensors provide flexibility in mechanical design, because many possible magnet orientations and movements produce a usable response from the sensor. [Figure 21](#) shows one of the most common orientations, which uses the full north to south range of the sensor and causes a close-to-linear change in magnetic flux density as the magnet moves across.

When designing a linear magnetic sensing system, always consider these three variables: the magnet, sensing distance, and the range of the sensor. Select the DRV5055-Q1 with the highest sensitivity that has a  $B_L$  (linear magnetic sensing range) that is larger than the maximum magnetic flux density in the application. To determine the magnetic flux density the sensor receives, TI recommends using magnetic field simulation software, referring to magnet specifications, and testing.

### 8.2.3 Application Curve

Figure 22 shows the simulated magnetic flux from a NdFeB magnet.

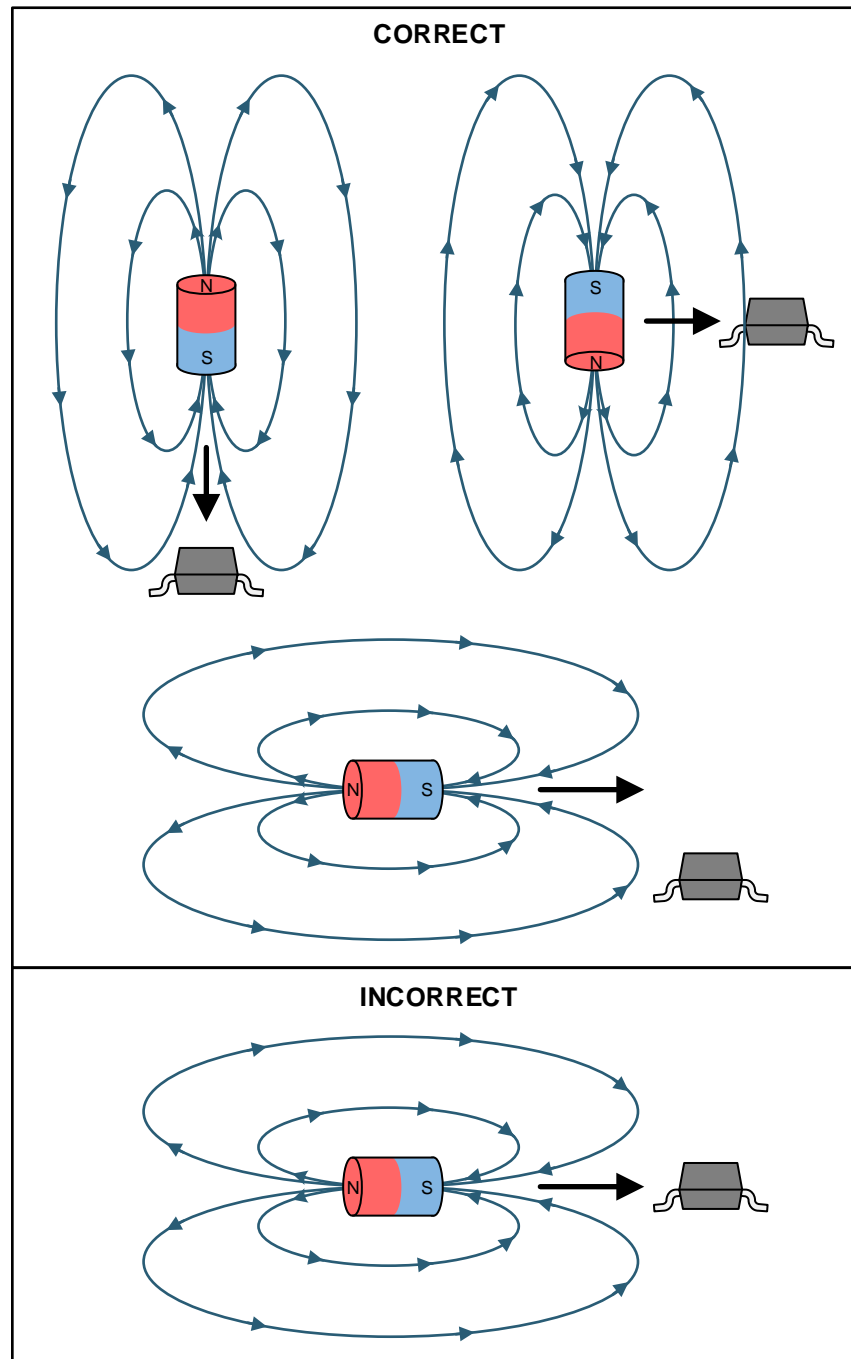

**Figure 22. Simulated Magnetic Flux**

### 8.3 Do's and Don'ts

Because the Hall element is sensitive to magnetic fields that are perpendicular to the top of the package, a correct magnet approach must be used for the sensor to detect the field. Figure 23 shows correct and incorrect approaches.

**Figure 23. Correct and Incorrect Magnet Approaches**

## 9 Power Supply Recommendations

A decoupling capacitor close to the device must be used to provide local energy with minimal inductance. TI recommends using a ceramic capacitor with a value of at least 0.01  $\mu\text{F}$ .

## 10 Layout

### 10.1 Layout Guidelines

Magnetic fields pass through most nonferromagnetic materials with no significant disturbance. Embedding Hall effect sensors within plastic or aluminum enclosures and sensing magnets on the outside is common practice. Magnetic fields also easily pass through most printed-circuit boards, which makes placing the magnet on the opposite side possible.

### 10.2 Layout Examples

**Figure 24. Layout Examples**

## 11 Device and Documentation Support

### 11.1 Documentation Support

#### 11.1.1 Related Documentation

For related documentation see the following:

### 11.4 Trademarks

E2E is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

### 11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 11.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

- <sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- <sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- <sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- <sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Reference JEDEC registration TO-236, except minimum foot length.
4. Support pin may differ or may not be present.

# EXAMPLE BOARD LAYOUT
