LMK04228

SNAS689A-OCTOBER 2017-REVISED JULY 2019

LMK04228 Ultra-Low Noise, JESD204B-Compliant **Clock Jitter Cleaner With Dual-Loop PLLs**

Features 1

- JEDEC JESD204B Support
- Ultra-Low RMS Jitter
 - 156 fs RMS Jitter (12 kHz to 20 MHz)
 - 245 fs RMS Jitter (100 Hz to 20 MHz)
 - 162.5 dBc/Hz Noise Floor at 245.76 MHz
- Up to 14 Differential Device Clocks from PLL2
 - Up to 7 SYSREF Clocks
 - Maximum Clock Output Frequency: 1.25 GHz
 - LVPECL, LVDS Programmable Outputs From PLL2
- Buffered VCXO or Crystal Output From PLL1
 - LVPECL, LVDS, 2xLVCMOS Programmable
- Dual Loop PLLatinum[™] PLL Architecture
- PLL1
 - Up to 3 Redundant Input Clocks
 - Automatic and Manual Switch-Over Modes
 - Hitless Switching and LOS
 - Integrated Low-Noise Crystal Oscillator Circuit
 - Holdover Mode When Input Clocks are Lost
- PLL2
 - Normalized [1 Hz] PLL Noise Floor of -224 dBc/Hz
 - Phase Detector Rate up to 155 MHz
 - OSCin Frequency-Doubler
 - Two Integrated Low-Noise VCOs
- 50% Duty Cycle Output Divides, 1 to 32 (Even and Odd)
- Precision Digital Delay
- 25-ps Step Analog Delay
- Multi-Mode: Dual PLL or Single PLL
- Industrial Temperature Range: -40°C to 85°C
- 3.15-V to 3.45-V Operation
- Package: 64-Pin WQFN (9.0 × 9.0 × 0.8 mm)

Applications 2

- Wireless Infrastructure
- Data Converter Clocking
- Networking, SONET/SDH, DSLAM
- Medical / Video / Military / Aerospace
- Test and Measurement

3 Description

The LMK04228 device is the industry's hiah performance clock conditioner with JEDEC JESD204B support.

The 14 clock outputs from PLL2 can be configured to drive seven JESD204B converters or other logic devices using device and SYSREF clocks. SYSREF can be provided using both DC and AC coupling. Not limited to JESD204B applications, each of the 14 outputs can be individually configured as high performance outputs for traditional clocking systems.

The high performance combined with features like the ability to trade off between power or performance, dual VCOs, holdover, and per-output adjustable analog and digital delay make the LMK04228 ideal for providing flexible high performance clocking trees.

Device Information⁽¹⁾

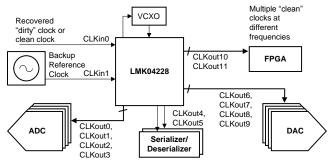

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LMK04228	WQFN (64)	9.00 mm × 9.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Frequency Outputs

4 Revision History

Changes from Original (October 2017) to Revision A

2	Submit Documentation Feedback Copyright © 2017–2019	, Texas Instruments Incorporated
•	Deleted reference to dynamic delay (unsupported)	
•	Corrected delay value descriptions for SDCLKoutY_ADLY	
•	Deleted reference to DCLKoutX_MUX bypass mode (unsupported)	40
•	Corrected PLL1_N register size in register map	35
•	Corrected CLKinX_R register size in register map	35
•	Deleted references to dynamic delay in register map (unsupported)	33
•	Changed address bits to clarify address position relative to data bits	33
•	Deleted redundant user-inaccessible registers in register map	33
•	Added registers 0x171 and 0x172 to default register programming	32
•	Clarified requirements for unused registers in recommended programming sequence	32
•	Removed device functional modes section	
•	Clarified digital lock detect for cases where phase detector frequency exceeds default PLL1_WN	D_SIZE 29
•	Deleted reference to distribution mode in SYNC/SYSREF clocking path diagram (unsupported)	22
•	Deleted reference to dynamic delay, bypass mode in clock output block diagram (unsupported)	21
•	Deleted reference to dynamic delay (unsupported)	19
•	Updated delay circuit descriptions for improved clarity	
•	Deleted reference to distribution mode (unsupported)	17
•	Updated description for improved clarity	
•	Removed typical phase noise plots	
•	Added missing cross reference to differential voltage definition	12
•	Updated default output table note	
•	Deleted reference to dynamic delay (unsupported)	
•	Deleted reference to distribution mode (unsupported)	1
•	Changed the data sheet release status from custom to catalog

Page

Revision History (continued)

•	Updated missing cross-reference	49
•	Corrected CLKinX_R register length	59
•	Corrected PLL1_N register length	
•	Corrected PLL2_R register length	64
•	Split PLL2_FCAL_DIS and PLL2_N register tables into separate definitions	66
•	Added register 0x171 and 0x172 to register descriptions	72
•	Corrected RB_PLL1_LD and RB_PLL2_LD polarity	73
•	Added note clarifying PLL1_WND_SIZE and impact on holdover exit	75
•	Changed references to deprecated software tools to point to TICS Pro	78
•	Removed application curves section	79
•	Deleted unused column in typical current consumption table	80
•	Fixed truncated layout example image	82
•	Deleted links to deprecated software tools	83

Table 1. Device Configuration Information

(1) OSCout may also be third clock input, CLKin2.

6 Pin Configuration and Functions

Pin Functions⁽¹⁾

PIN		1/0	TYPE	DESCRIPTION	
NO.	NAME	I/O	TYPE	DESCRIPTION	
1	DCLKout0	0	Programmable	Device shall entrol 0	
2	DCLKout0*			Device clock output 0.	
3	SDCLKout1	0	Programmable	SYSREF / Device clock output 1	
4	SDCLKout1*	0			

(1) See Pin Connection Recommendations section for recommended connections.

Pin Functions⁽¹⁾ (continued)

E	PIN			
NO.	NAME	I/O	TYPE	DESCRIPTION
5	RESET/GPO	1	CMOS	Device reset input or GPO
6	SYNC/SYSREF_REQ	1	CMOS	Synchronization input or SYSREF_REQ for requesting continuous SYSREF.
	NC	-	CINOS	Do not connect. These pins must be left floating.
7, 8, 9				
10	Vcc1_VCO	_	PWR	Power supply for VCO LDO.
11	LDObyp1	_	ANLG	LDO Bypass, bypassed to ground with 10-µF capacitor.
12	LDObyp2		ANLG	LDO Bypass, bypassed to ground with a 0.1-µF capacitor.
13	SDCLKout3	0	Programmable	SYSREF / Device Clock output 3.
14	SDCLKout3*			
15	DCLKout2	0	Programmable	Device clock output 2.
16	DCLKout2*		-	
17	Vcc2_CG1	_	PWR	Power supply for clock outputs 2 and 3.
18	CS*	I	CMOS	Chip Select
19	SCK	I	CMOS	SPI Clock
20	SDIO	I/O	CMOS	SPI Data
21	Vcc3_SYSREF	—	PWR	Power supply for SYSREF divider and SYNC.
22	SDCLKout5	0	Programmable	SYSREF / Device clock output 5.
23	SDCKLout5*	0	riogrammable	
24	DCLKout4	0	Programmable	Device clock output 4.
25	DCLKout4*	0	Flogrammable	
26	Vcc4_CG2	_	PWR	Power supply for clock outputs 4, 5, 6 and 7.
27	DCLKout6		-	
28	DCLKout6*	0	Programmable	Device clock output 6.
29	SDCLKout7	-	-	
30	SDCLKout7*	0	Programmable	SYSREF / Device clock output 7.
31	Status_LD1	I/O	Programmable	Programmable status pin.
32	CPout1	0	ANLG	Charge pump 1 output.
33	Vcc5_DIG	_	PWR	Power supply for the digital circuitry.
34	CLKin1			
35	CLKin1*	I	ANLG	Reference Clock Input Port 1 for PLL1.
36	Vcc6_PLL1	_	PWR	Power supply for PLL1, charge pump 1, holdover DAC
37	CLKin0			
38	CLKin0*	I	ANLG	Reference Clock Input Port 0 for PLL1.
39	Vcc7_OSCout	_	PWR	Power supply for OSCout port.
40	OSCout/CLKin2			Buffered output of OSCin port.
41	OSCout*/CLKin2*	0	Programmable	Reference Clock Input Port 2 for PLL1.
42	Vcc8_OSCin	_	PWR	Power supply for OSCin
42	OSCin		I VVIX	
43	OSCIn OSCin*	- 1	ANLG	Feedback to PLL1, Reference input to PLL2. AC-coupled.
44		_	PWR	Power supply for PLL2 Charge Pump.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) (1)(2)(3)

		MIN	MAX	UNIT
V _{CC}	Supply voltage (4)	-0.3	3.6	V
V _{IN}	Input voltage	-0.3	(V _{CC} + 0.3)	V
TL	Lead temperature (solder 4 seconds)		+260	°C
TJ	Junction temperature		150	°C
I _{IN}	Differential input current (CLKinX/X*, OSCin/OSCin*)		±5	mA
MSL	Moisture sensitivity level		3	
T _{stg}	Storage temperature	-65	150	°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) This device is a high performance RF integrated circuit with an ESD rating up to 2-kV Human Body Model, up to 150-V Machine Model, and up to 250-V Charged Device Model and is ESD-sensitive. Handling and assembly of this device should only be done at ESD-free workstations.

(3) Stresses in excess of the absolute maximum ratings can cause permanent or latent damage to the device. These are absolute stress ratings only. Functional operation of the device is only implied at these or any other conditions in excess of those given in the operation sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.

(4) Never to exceed 3.6 V.

7.2 ESD Ratings

			VALUE	UNIT
		Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	
V _(ESD)	Electrostatic discharge	Charged-device model (CDM), per JEDEC specification JESD22-C101 $^{\left(2\right) }$	±250	V
		Machine model (MM)	±150	

 JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions. Pins listed as ±2000 V may actually have higher performance.
 JEDEC document JEP157 states that 500 V GRA listed as ±2000 V may actually have higher performance.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions. Pins listed as ±250 V may actually have higher performance.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	TYP	MAX	UNIT
TJ	Junction temperature			125	°C
T _A	Ambient temperature	-40	25	85	°C
V _{CC}	Supply voltage	3.15	3.3	3.45	V

7.4 Thermal Information

		LMK04228	
	THERMAL METRIC ⁽¹⁾	NKD (WQFN)	UNIT
		64 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance ⁽²⁾	24.3	°C/W
R _{0JC(top)}	Junction-to-case (top) thermal resistance ⁽³⁾	6.1	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance ⁽⁴⁾	3.5	°C/W
ΨJT	Junction-to-top characterization parameter ⁽⁵⁾	0.1	°C/W
ΨЈВ	Junction-to-board characterization parameter ⁽⁶⁾	3.5	°C/W
R _{0JC(bot)}	Junction-to-case (bottom) thermal resistance ⁽⁷⁾	0.7	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, High-K board, as (2) specified in JESD51-7, in an environment described in JESD51-2a.

(3) The junction-to-case(top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

(4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.

(5) The junction-to-top characterization parameter, Ψ_{JT} , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining $R_{\theta JA}$, using a procedure described in JESD51-2a (sections 6 and 7). The junction-to-board characterization parameter, Ψ_{JB} estimates the junction temperature of a device in a real system and is extracted

(6)from the simulation data for obtaining $R_{\theta JA}$, using a procedure described in JESD51-2a (sections 6 and 7).

The junction-to-case(bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific (7)JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

7.5 Electrical Characteristics

 $(3.15 \text{ V} < \text{V}_{CC} < 3.45 \text{ V}, -40^{\circ}\text{C} < \text{T}_{\text{A}} < 85^{\circ}\text{C}$. Typical values at $\text{V}_{CC} = 3.3 \text{ V}, \text{T}_{\text{A}} = 25^{\circ}\text{C}$, at the Recommended Operating Conditions and are not assured.)

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
CURRENT CC	ONSUMPTION					
I _{CC_PD}	Power-down supply current			1	3	mA
I _{CC_CLKS}	Supply current ⁽¹⁾ 14 LVDS clocks enabled 485 PLL1 and PLL2 locked. 485		485		mA	
CLKin0/0*, CL	Kin1/1*, AND CLKin2/2* INPUT C	LOCK SPECIFICATIONS				
f _{CLKin}	Clock input frequency		0.001		400	MHz
SLEW _{CLKin}	Clock input slew rate ⁽²⁾	20% to 80%	0.15	0.5		V/ns
V _{ID} CLKin	Clock input		0.125		1.55	V
V _{SS} CLKin	differential input voltage ⁽³⁾ Figure 2	AC-coupled	0.25		3.1	Vpp
V _{CLKin}	Clock input single-ended input voltage	AC-coupled to CLKinX; CLKinX* AC-coupled to Ground CLKinX_TYPE = 0 (Bipolar)	0.25		2.4	Maria
		AC-coupled to CLKinX; CLKinX* AC-coupled to Ground CLKinX_TYPE = 1 (MOS)	0.35		2.4	Vpp

(1) See applications section *Power Supply Recommendations* for specific part configuration and how to calculate the I_{CC} for a specific desian.

To meet the jitter performance listed in the subsequent sections of this data sheet, the minimum recommended slew rate for all input clocks is 0.5 V/ns. This is especially true for single-ended clocks. Phase noise performance will begin to degrade as the clock input slew rate is reduced. However, the device will function at slew rates down to the minimum listed. When compared to single-ended clocks, differential clocks (LVDS, LVPECL) will be less susceptible to degradation in phase noise performance at lower slew rates due to their common-mode noise rejection. However, TI also recommends using the highest possible slew rate for differential clocks to achieve optimal phase noise performance at the device outputs.

See Differential Voltage Measurement Terminology for definition of VID and VOD voltages. (3)

Electrical Characteristics (continued)

 $(3.15 \text{ V} < \text{V}_{CC} < 3.45 \text{ V}, -40^{\circ}\text{C} < \text{T}_{\text{A}} < 85^{\circ}\text{C}$. Typical values at $\text{V}_{CC} = 3.3 \text{ V}, \text{T}_{\text{A}} = 25^{\circ}\text{C}$, at the Recommended Operating Conditions and are **not** assured.)

- (6) Assured by characterization. ATE tested at 122.88 MHz.
- (7) The EN_PLL2_REF_2X bit enables/disables a frequency doubler mode for the PLL2 OSCin path.
- (8) A specification in modeling PLL in-band phase noise is the 1/f flicker noise, L_{PLL_flicker}(f), which is dominant close to the carrier. Flicker noise has a 10 dB/decade slope. PN10kHz is normalized to a 10-kHz offset and a 1-GHz carrier frequency. PN10kHz = L_{PLL_flicker}(10 kHz) 20log(Fout / 1 GHz), where L_{PLL_flicker}(f) is the single-side band phase noise of only the flicker noise's contribution to total noise, L(f). To measure L_{PLL_flicker}(f) it is important to be on the 10 dB/decade slope close to the carrier. A high compare frequency and a clean crystal are important to isolating this noise source from the total phase noise, L(f). L_{PLL_flicker}(f) can be masked by the reference oscillator performance if a low power or noisy source is used. The total PLL in-band phase noise performance is the sum of L_{PLL_flicker}(f) and L_{PLL_flick}(f).
- (9) A specification modeling PLL in-band phase noise. The normalized phase noise contribution of the PLL, L_{flat}(f), is defined as: PN1HZ=L_{PLL_flat}(f) – 20log(N) – 10log(f_{PDX}). L_{PLL_flat}(f) is the single-side band phase noise measured at an offset frequency, f, in a 1-Hz bandwidth and f_{PDX} is the phase detector frequency of the synthesizer. L_{PLL_flat}(f) contributes to the total noise, L(f).
- (10) For frequencies in between, linearly interpolate to compute the typical Kvco

(11) Maximum Allowable Temperature Drift for Continuous Lock is how far the temperature can drift in either direction from the value it was at the time that the 0x168 register was last programmed with PLL2_FCAL_DIS = 0, and still have the part stay in lock. The action of programming the 0x168 register, even to the same value, activates a frequency calibration routine. This implies the part will work over the entire frequency range, but if the temperature drifts more than the maximum allowable drift for continuous lock, then it will be necessary to reload the appropriate register to ensure it stays in lock. Regardless of what temperature the part was initially programmed at, the temperature can never drift outside the frequency range of -40°C to 85°C without violating specifications.

(12) Data collected using MACOM H-183-4 balun. Loop filter is C1 = 82 pF, C2 = 2.2 nF, R2 = 1800 Ω, C3 = 10 pF, R3 = 200 Ω, C4 = 10 pF, R4 = 200 Ω, PLL1_CP = 650 µA, PLL2_CP = 1600 µA. VCO0 loop filter bandwidth = 176 kHz, phase margin = 67 degrees. VCO1 Loop filter loop bandwidth = 169 kHz, phase margin = 66 degrees. CLKoutX_Y_IDL = 1, CLKoutX_Y_ODL = 0.

(13) VCXO used is a 30.72 MHz (TXC Bex05).

7.7 Timing Diagram

Register programming information on the SDIO pin is clocked into a shift register on each rising edge of the SCK signal. On the rising edge of the CS* signal, the register is sent from the shift register to the register addressed. A slew rate of at least 30 V/µs is recommended for these signals. After programming is complete, the CS* signal should be returned to a high state. If the SCK or SDIO lines are toggled while the VCO is in lock, as is sometimes the case when these lines are shared with other parts. The phase noise may be degraded during this programming.

Four-wire mode read back has same timing as SDIO pin.

R/W bit = 0 is for SPI write. R/W bit = 1 is for SPI read.

W1 and W0 will be written as 0.

Timing Diagram (continued)

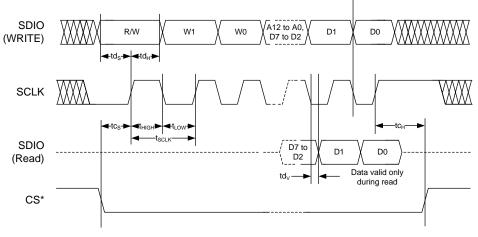

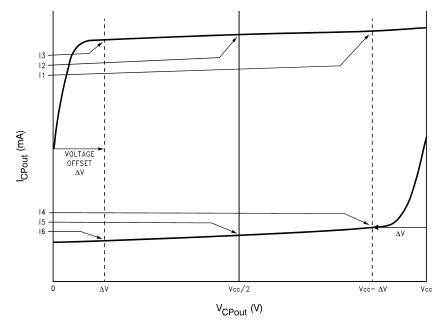

Figure 1. SPI Timing Diagram

8 Parameter Measurement Information

8.1 Charge Pump Current Specification Definitions

I1 = Charge Pump Sink Current at V_{CPout} = V_{CC} – Δ V

- I2 = Charge Pump Sink Current at V_{CPout} = V_{CC}/2
- I3 = Charge Pump Sink Current at $V_{CPout} = \Delta V$
- I4 = Charge Pump Source Current at V_{CPout} = V_{CC} Δ V

I5 = Charge Pump Source Current at $V_{CPout} = V_{CC}/2$

I6 = Charge Pump Source Current at $V_{CPout} = \Delta V$

 ΔV = Voltage offset from the positive and negative supply rails. Defined to be 0.5 V for this device.

8.1.1 Charge Pump Output Current Magnitude Variation vs. Charge Pump Output Voltage

$$I_{CPout}$$
 Vs $V_{CPout} = \frac{||1| - ||3|}{||1| + ||3|} \times 100\%$
= $\frac{||4| - ||6|}{||4| + ||6|} \times 100\%$

8.1.2 Charge Pump Sink Current vs. Charge Pump Output Source Current Mismatch

$$I_{CPout}$$
 Sink Vs I_{CPout} Source = $\frac{||2| - ||5|}{||2| + ||5|} \times 100\%$

8.1.3 Charge Pump Output Current Magnitude Variation vs. Ambient Temperature

$$I_{CPout} Vs T_{A} = \frac{|I_{2}||_{T_{A}} - |I_{2}||_{T_{A}} = 25^{\circ}C}{|I_{2}||_{T_{A}} = 25^{\circ}C} \times 100\%$$
$$= \frac{|I_{5}||_{T_{A}} - |I_{5}||_{T_{A}} = 25^{\circ}C}{|I_{5}||_{T_{A}} = 25^{\circ}C} \times 100\%$$

8.2 Differential Voltage Measurement Terminology

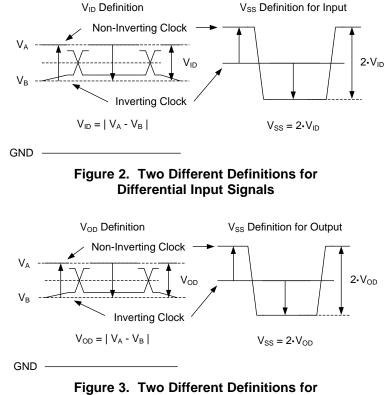

The differential voltage of a differential signal can be described by two different definitions causing confusion when reading data sheets or communicating with other engineers. This section will address the measurement and description of a differential signal so that the reader will be able to understand and distinguish between the two different definitions when used.

The first definition used to describe a differential signal is the absolute value of the voltage potential between the inverting and noninverting signal. The symbol for this first measurement is typically V_{ID} or V_{OD} depending on if an input or output voltage is being described.

The second definition used to describe a differential signal is to measure the potential of the noninverting signal with respect to the inverting signal. The symbol for this second measurement is V_{SS} and is a calculated parameter. Nowhere in the IC does this signal exist with respect to ground, it only exists in reference to its differential pair. V_{SS} can be measured directly by oscilloscopes with floating references, otherwise this value can be calculated as twice the value of V_{OD} as described in the first description.

Figure 2 illustrates the two different definitions side-by-side for inputs and Figure 3 illustrates the two different definitions side-by-side for outputs. The V_{ID} and V_{OD} definitions show V_A and V_B DC levels that the noninverting and inverting signals toggle between with respect to ground. V_{SS} input and output definitions show that if the inverting signal is considered the voltage potential reference, the noninverting signal voltage potential is now increasing and decreasing above and below the noninverting reference. Thus the peak-to-peak voltage of the differential signal can be measured.

 V_{ID} and V_{OD} are often defined as volts (V) and V_{SS} is often defined as volts peak-to-peak (V_{PP}).

Differential Output Signals

Refer to application note AN-912 Common Data Transmission Parameters and their Definitions (SNLA036) for more information.

9 Detailed Description

9.1 Overview

The LMK04228 is a highly flexible dual-PLL jitter cleaner and integrated VCO clock generator, providing up to 15 configurable outputs. The typical use case for LMK04228 is as a cascaded dual-loop jitter cleaner for JESD204B systems. However traditional (non-JESD204B) systems are possible with use of the large SYSREF divider to produce a low frequency. Device Clock outputs (DCLKoutX) provide configurable LVDS and LVPECL options, while the OSCout output may be used to provide a buffered copy of a VCXO/Crystal signal in LVDS, LVPECL, or LVCMOS formats.

The LMK04228 may be configured for single-loop mode by powering down unused blocks in PLL1.

9.1.1 Jitter Cleaning

The dual-loop PLL architecture of the LMK04228 provides the lowest jitter performance over a wide range of output frequencies and phase noise integration bandwidths. The first stage PLL (PLL1) is driven by an external reference clock and uses an external VCXO or tunable crystal to provide a frequency-accurate, low phase noise reference clock for the second stage frequency multiplication PLL (PLL2).

PLL1 typically uses a narrow loop bandwidth (typically between 10 Hz to 200 Hz) to retain the frequency accuracy of the reference clock input signal while at the same time suppressing the higher offset frequency phase noise that the reference clock may have accumulated along its path or from other circuits. This *cleaned* reference clock provides the reference input to PLL2.

The low phase noise reference provided to PLL2 allows PLL2 to operate with a wide loop bandwidth (typically between 50 kHz to 200 kHz). The loop bandwidth for PLL2 is chosen to take advantage of the superior high offset frequency phase noise profile of the internal VCO and the good low offset frequency phase noise of the reference VCXO or tunable crystal.

Ultra-low jitter is achieved by allowing the phase noise of the external VCXO or crystal to dominate the final output phase noise at low offset frequencies, and the phase noise of the internal VCO to dominate the final output phase noise at high offset frequencies. This results in best overall phase noise and jitter performance.

9.1.2 JEDEC JESD204B Support

The LMK04228 provides support for JEDEC JESD204B. The LMK04228 will clock up to 7 JESD204B targets using 7 device clocks (DCLKoutX) and 7 SYSREF clocks (SDCLKoutY). Each device clock is grouped with a SYSREF clock.

It is also possible to reprogram SYSREF clocks to behave as extra device clocks for applications which have non-JESD204B clock requirements.

9.1.3 Three PLL1 Redundant Reference Inputs (CLKin0/CLKin0*, CLKin1/CLKin1*, and CLKin2/CLKin2*)

The LMK04228 has up to three reference clock inputs for PLL1 (CLKin0, CLKin1, and CLKin2). The active clock is chosen based on CLKin_SEL_MODE. Automatic or manual switching can occur between the inputs.

CLKin0, CLKin1, and CLKin2 each have their own PLL1 R dividers.

CLKin2 is shared for use as OSCout. To use as CLKin2, OSCout must be powered down. See VCO_MUX, OSCout_FMT for more details.

Fast manual switching between reference clocks is possible with a external pins CLKin_SEL0 and CLKin_SEL1.

9.1.4 VCXO- and Crystal-Buffered Output

The LMK04228 provides OSCout, which by default is a buffered copy of the PLL1 feedback/PLL2 reference input. This reference input is typically a low noise VCXO or crystal. When using a VCXO, this output can be used to clock external devices such as microcontrollers, FPGAs, CPLDs, and so forth, before the LMK04228 is programmed.

The OSCout buffer output type is programmable to LVDS, LVPECL, or LVCMOS.

Once PLL1 lock is established, the buffered output of VCXO/crystal has a deterministic phase relationship with the CLKin input used as the PLL1 reference.

Overview (continued)

9.1.5 Frequency Holdover

The LMK04228 supports holdover operation to keep the clock outputs on frequency with minimum drift when the reference is lost until a valid reference clock signal is re-established.

9.1.6 PLL2 Integrated Loop Filter Poles

The LMK04228 features programmable 3rd- and 4th-order loop filter poles for PLL2. These internal resistors and capacitor values may be selected from a fixed range of values to achieve either a 3rd- or 4th-order loop filter response. The integrated programmable resistors and capacitors complement larger external components mounted near the chip.

These integrated components can be effectively disabled by programming the integrated resistors and capacitors to their minimum values.

9.1.7 Internal VCOs

The LMK04228 has two internal VCOs, selected by VCO_MUX. The output of the selected VCO is routed to the Clock Distribution Path. This same selection is also fed back to the PLL2 phase detector through a prescaler and N-divider.

9.1.8 Clock Distribution

The LMK04228 features a total of 14 PLL2 clock outputs driven from the internal VCO.

All PLL2 clock outputs have programmable output types. They can be programmed to LVPECL or LVDS formats.

The total number of clock outputs the LMK04228 is able to distribute, including OSCout, is up to 15 differential clocks.

The following sections discuss specific features of the clock distribution channels that allow the user to control various aspects of the output clocks.

9.1.8.1 Device Clock Divider

Each device clock, DCLKoutX, has a single clock output divider. The divider supports a divide range of 1 to 32 (even and odd) with 50% output duty cycle using duty cycle correction mode. The output of this divider may also be directed to SDCLKoutY, where Y = X + 1.

9.1.8.2 SYSREF Clock Divider

The SYSREF clocks, SDCLKoutY, all share a common divider. The divider supports a divide range of 8 to 8191 (even and odd).

9.1.8.3 Device Clock Delay

The device clocks include both a analog and digital delay for phase adjustment of the clock outputs.

The analog delay allows a nominal 25-ps step size and range from 0 to 575 ps of granular delay. Enabling the device clock analog delay adds a nominal 500-ps delay in addition to the programmed value.

The digital delay allows an output to be delayed from 3.5 to 32 VCO cycles. The delay step can be as small as half the period of the clock distribution path. For example, 2-GHz VCO frequency results in 250-ps tuning steps. The digital delay value takes effect on the clock outputs after a SYNC event. Fixed digital delay allows all the outputs to have a known phase relationship upon a SYNC event and is typically performed at start-up.

9.1.8.4 SYSREF Delay

The global SYSREF divider includes a digital delay block which allows a global phase shift with respect to the other clocks.

Each local SYSREF clock output includes both an analog and additional local digital delay for unique phase adjustment of each SYSREF clock.

Overview (continued)

The local analog delay allows for 150-ps steps, ranging from 600 ps to 2700 ps of granular delay. Enabling the analog delay path adds a nominal 700 ps of delay in addition to the programmed value, and the first delay value adds 600 ps.

The local digital delay and SYSREF_HS bit allows the each individual SYSREF output to be delayed from 1.5 to 11 VCO cycles. The delay step can be as small as half the period of the clock distribution path by using the DCLKoutX_HS bit. For example, 2-GHz VCO frequency results in 250-ps coarse tuning steps.

9.1.8.5 Programmable Output Formats

For increased flexibility LMK04228 device and SYSREF clock outputs, DCLKoutX and SDCLKoutY, can be programmed to an LVDS or LVPECL output type. The OSCout can be programmed to an LVDS, LVPECL, or LVCMOS output type.

Any LVPECL output type can be programmed to 1600- or 2000-mVpp amplitude levels. The 2000-mVpp LVPECL output type is a Texas Instruments proprietary configuration that produces a 2000-mVpp differential swing for compatibility with many data converters and is also known as 2VPECL.

9.1.8.6 Clock Output Synchronization

Using the SYNC input causes all active clock outputs to share a rising edge as programmed by fixed digital delay.

The SYNC event must occur for digital delay values to take effect.

9.1.9 Status Pins

The LMK04228 provides status pins which can be monitored for feedback or in some cases used for input depending upon device programming. For example:

- The CLKin_SEL0 pin may indicate the LOS (loss-of-signal) for CLKin0.
- The CLKin_SEL1 pin may be an input for selecting the active clock input.
- The Status_LD1 pin may indicate if the device is locked.
- The Status_LD2 pin may indicate if PLL2 is locked.

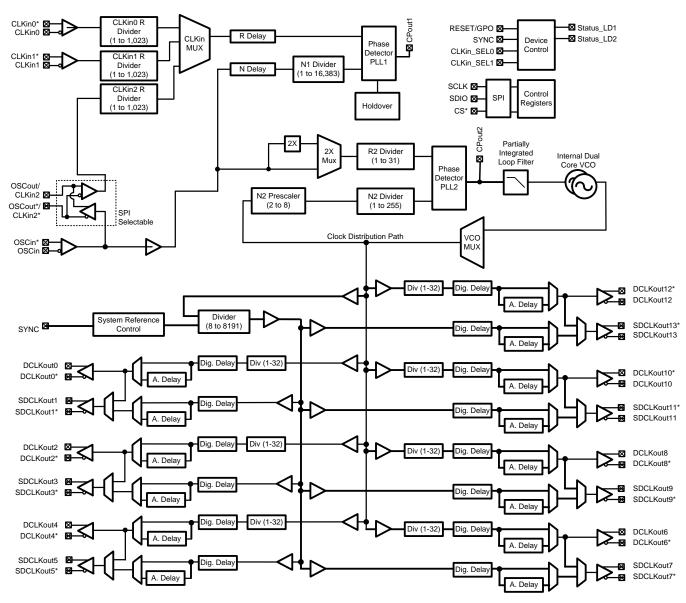

The status pins can be programmed to a variety of other outputs including PLL divider outputs, combined PLL lock detect signals, PLL1 Vtune railing, readback, and other internal status signals. Refer to the *Programming* section of this data sheet for more information.

Figure 6. SYNC/SYSREF Clocking Paths

9.3 Feature Description

9.3.1 SYNC/SYSREF

The SYNC and SYSREF signals share the same clocking path. To properly use SYNC and SYSREF for JESD204B, it is important to understand the SYNC/SYSREF system. Figure 5 illustrates the detailed diagram of a clock output block with SYNC circuitry included. Figure 6 illustrates the interconnects and highlights some important registers used in controlling the device for SYNC/SYSREF purposes.

To reset or synchronize a divider, the following conditions must be met:

- 1. SYNC_EN must be set. This ensures proper operation of the SYNC circuitry.
- SYSREF_MUX and SYNC_MODE must be set to a proper combination to provide a valid SYNC/SYSREF signal.
 - If SYSREF block is being used, the SYSREF_PD bit must be clear.
 - If the SYSREF Pulser is being used, the SYSREF_PLSR_PD bit must be clear.
- 3. For each SDCLKoutY being used for SYSREF, respective SDCLKoutY_PD bits must be cleared.
- 4. SYSREF_DDLY_PD and DCLKoutX_DDLY_PD bits must be clear to power up the digital delay circuitry during SYNC as use requires.
- 5. The SYNC_DISX bit must be clear to allow SYNC/SYSREF signal to divider circuit. The SYSREF_MUX register selects the SYNC source which resets the SYSREF/CLKoutX dividers provided the corresponding SYNC_DISX bit is clear.
- 6. Other bits which impact the operation of SYNC such as SYNC_1SHOT_EN may be set as desired.

Table 2 illustrates the some possible combinations of SYSREF_MUX and SYNC_MODE.

NAME	SYNC_MODE	SYSREF_MUX	OTHER	DESCRIPTION
SYNC Disabled	0	0	CLKin0_OUT_MUX ≠ 0	No SYNC will occur.
Pin or SPI SYNC	1	0	CLKin0_OUT_MUX ≠ 0	Basic SYNC functionality, SYNC pin polarity is selected by SYNC_POL. To achieve SYNC through SPI, toggle the SYNC_POL bit.
Differential input SYNC	0 or 1	0 or 1	CLKin0_OUT_MUX = 0	Differential CLKin0 now operates as SYNC input.
JESD204B Pulser on pin transition.	2	2	SYSREF_PULSE_CNT sets pulse count	Produce SYSREF_PULSE_CNT programmed number of pulses on pin transition. SYNC_POL can be used to cause SYNC through SPI.
JESD204B Pulser on SPI programming.	3	2	SYSREF_PULSE_CNT sets pulse count	Programming SYSREF_PULSE_CNT register starts sending the number of pulses.
Re-clocked SYNC	1	1	SYSREF operational, SYSREF Divider as required for training frame size.	Allows precise SYNC for n-bit frame training patterns for non-JESD converters such as LM97600.
External SYSREF request	0	2	SYSREF_REQ_EN = 1 Pulser powered up	When SYNC pin is asserted, continuous SYSERF pulses occur. Turning on and off of the pulses is synchronized to prevent runt pulses from occurring on SYSREF.
Continuous SYSREF	Х	3	SYSREF_PD = 0 SYSREF_DDLY_PD = 0 SYSREF_PLSR_PD = 1	Continuous SYSREF signal.

 Table 2. Some Possible SYNC Configurations

 SDCLKoutY_PD = 0 as required per SYSREF output. This applies to any SYNC or SYSREF output on SDCLKoutY when SDCLKoutY_MUX = 1 (SYSREF output)

Feature Description (continued)

NAME	SYNC_MODE	SYSREF_MUX	OTHER	DESCRIPTION
Direct SYSREF distribution	0	0	CLKin0_OUT_MUX = 0 SDCLKoutY_DDLY = 0 (Local sysref DDLY bypassed) SYSREF_DDLY_PD = 1 SYSREF_PLSR_PD = 1 SYSREF_PD = 1.	A direct fan-out of SYSREF with no reclocking to clock distribution path.

9.3.2 JEDEC JESD204B

9.3.2.1 How to Enable SYSREF

Table 3 summarizes the bits needed to make SYSREF functionality operational.

Table 3. SYSREF Bits

REGIS TER	FIELD	VALUE	DESCRIPTION
0x140	SYSREF_PD	0	Must be clear, power-up SYSREF circuitry.
0x140	SYSREF_DDLY_ PD	0	Must be clear to power-up digital delay circuitry during initial SYNC to ensure deterministic timing.
0x143	SYNC_EN	1	Must be set, enable SYNC.
0x143	SYSREF_CLR	1 → 0	Do not hold local SYSREF DDLY block in reset except at start. Anytime SYSREF_PD = 1 because of user programming or device RESET, it is necessary to set SYSREF_CLR for 15 VCO clock cycles to clear the local SYSREF digital delay. Once cleared, SYSREF_CLR must be cleared to allow SYSREF to operate.

Enabling JESD204B operation involves synchronizing all the clock dividers with the SYSREF divider, then configuring the actual SYSREF functionality.

9.3.2.1.1 Setup of SYSREF Example

The following procedure is a programming example for a system which is to operate with a 3000-MHz VCO frequency. Use DCLKout0 and DCLKout2 to drive converters at 750 MHz. Use DCLKout4 to drive an FPGA at 150 MHz. Synchronize the converters and FPGA using a two SYSREF pulses at 10 MHz.

1. Program registers 0x000 to 0x1fff as desired. Key to prepare for SYSREF operations:

- a. Prepare for manual SYNC: SYNC_POL = 0, SYNC_MODE = 1, SYSREF_MUX = 0
- b. Setup output dividers as per example: DCLKout0_DIV and DCLKout2_DIV = 4 for frequency of 750 MHz. DCLKout4_DIV = 20 for frequency of 150 MHz.
- c. Setup output dividers as per example: SYSREF_DIV = 300 for 10 MHz SYSREF
- d. Setup SYSREF: SYSREF_PD = 0, SYSREF_DDLY_PD = 0, DCLKout0_DDLY_PD = 0, DCLKout2_DDLY_PD = 0, DCLKout4_DDLY_PD = 0, SYNC_EN = 1, SYSREF_PLSR_PD = 0, SYSREF_PULSE_CNT = 1 (2 pulses). SDCLKout1_PD = 0, SDCLKout3_PD = 0"
- e. Clear Local SYSREF DDLY: SYSREF_CLR = 1.

2. Establish deterministic phase relationships between SYSREF and Device Clock for JESD204B:

- a. Set device clock and SYSREF divider digital delays: DCLKout0_DDLY_CNTH, DCLKout0_DDLY_CNTL, DCLKout2_DDLY_CNTH, DCLKout2_DDLY_CNTL, DCLKout4_DDLY_CNTH, DCLKout4_DDLY_CNTL, SYSREF_DDLY.
- b. Set device clock digital delay half steps: DCLKout0_HS, DCLKout2_HS, DCLKout4_HS.
- c. Set SYSREF clock digital delay as required to achieve known phase relationships: SDCLKout1_DDLY, SDCLKout3_DDLY, SDCLKout5_DDLY.
- d. To allow SYNC to effect dividers: SYNC_DIS0 = 0, SYNC_DIS2 = 0, SYNC_DIS4 = 0, SYNC_DISSYSREF = 0
- e. Perform SYNC by toggling SYNC_POL = 1 then SYNC_POL = 0.

TEXAS INSTRUMENTS

www.ti.com

- 3. Now that dividers are synchronized, **disable SYNC from resetting these dividers.** It is not desired for SYSREF to reset its own divider or the dividers of the output clocks.
 - a. Prevent SYNC (SYSREF) from affecting dividers: SYNC_DIS0 = 1, SYNC_DIS2 = 1, SYNC_DIS4 = 1, SYNC_DISSYSREF = 1.
- 4. Release reset of local SYSREF digital delay.
 - a. SYSREF_CLR = 0. Note this bit needs to be set for only 15 VCO clocks after SYSREF_PD = 0.

5. Set SYSREF operation.

- a. Allow pin SYNC event to start pulser: SYNC_MODE = 2.
- b. Select pulser as SYSREF signal: SYSREF_MUX = 2.
- 6. **Complete!** Now asserting the SYNC pin, or toggling SYNC_POL will result in a series of 2 SYSREF pulses.

9.3.2.1.2 SYSREF_CLR

The local digital delay of the SDCLKout is implemented as a shift buffer. To ensure no unwanted pulses occur at this SYSREF output at start-up, when using SYSREF, requires clearing the buffers by setting SYSREF_CLR = 1 for 15 VCO clock cycles. After a reset, this bit is set, so it must be cleared before SYSREF output is used.

9.3.2.2 SYSREF Modes

9.3.2.2.1 SYSREF Pulser

This mode allows for the output of 1, 2, 4, or 8 SYSREF pulses for every SYNC pin event or SPI programming. This implements the gapped periodic functionality of the JEDEC JESD204B specification.

When in SYSREF Pulser mode, programming the field SYSREF_PULSE_CNT in register 0x13E will result in the pulser sending the programmed number of pulses.

9.3.2.2.2 Continuous SYSREF

This mode allows for continuous output of the SYSREF clock.

Continuous operation of SYSREF is not recommended due to crosstalk from the SYSREF clock to device clock. JESD204B is designed to operate with a single burst of pulses to initialize the system at start-up, after which it is theoretically not required to send another SYSREF because the system will continue to operate with deterministic phases.

If continuous operation of SYSREF is required, consider using a SYSREF output from a non-adjacent output or SYSREF from the OSCout pin to minimize crosstalk.

9.3.2.2.3 SYSREF Request

This mode allows an external source to synchronously turn on or off a continuous stream of SYSREF pulses using the SYNC/SYSREF_REQ pin.

Set up the mode by programming SYSREF_REQ_EN = 1 and SYSREF_MUX = 2 (Pulser). The pulser does not need to be powered for this mode of operation.

When the SYSREF_REQ pin is asserted, the SYSREF_MUX will synchronously be set to continuous mode providing continuous pulses at the SYSREF frequency until the SYSREF_REQ pin is unasserted and the final SYSREF pulse will complete sending synchronously.

LMK04228 SNAS689A-OCTOBER 2017-REVISED JULY 2019

9.3.3 Digital Delay

Digital (coarse) delay allows a group of outputs to be delayed by 4 to 32 VCO cycles. The delay step can be as small as half the period of the VCO cycle by using the DCLKoutX_HS bit. It is fixed digital delay.

The regular clock divider is substituted with an alternative divide value. The substitute divide value consists of two values, DCLKoutX_DDLY_CNTH and DCLKoutX_DDLY_CNTL. The minimum _CNTH/_CNTL value is 2 and the maximum _CNTH/_CNTL value is 16. This will result in a minimum alternative divide value of 4 and a maximum of 32.

9.3.3.1 Fixed Digital Delay

Fixed digital delay value takes effect on the clock outputs after a SYNC event. As such, the outputs will be LOW for a while during the SYNC event.

9.3.3.1.1 Fixed Digital Delay Example

Assuming the device already has the following initial configurations, and the application should delay DCLKout2 by one VCO cycle compared to DCLKout0.

- VCO frequency = 2949.12 MHz
- DCLKout0 = 368.64 MHz (DCLKout0_DIV = 8)
- DCLKout2 = 368.64 MHz (DCLKout2_DIV = 8)

The following steps should be followed

- 1. Set DCLKout0_DDLY_CNTH = 4 and DCLKout2_DDLY_CNTH = 4. First part of delay for each clock.
- 2. Set DCLKout0_DDLY_CNTL = 4 and DCLKout2_DDLY_CNTL = 5. Second part of delay for each clock.
- 3. Set DCLKout2_DDLY_PD = 0 and DCLKout2_DDLY_PD = 0. Power up the digital delay circuit.
- 4. Set SYNC_DIS0 = 0 and SYNC_DIS2 = 0. Allow the output to be synchronized.
- 5. Perform SYNC by asserting, then unasserting SYNC. Either by using SYNC_POL bit or the SYNC pin.
- Power down DCLKout2_DDLY_PD = 0 and/or DCLKout2_DDLY_PD = 1 to save power now that the SYNC is complete.
- 7. Set SYNC_DIS0 = 1 and SYNC_DIS2 = 1 to prevent the output from being synchronized; this step is very important for steady-state operation when using JESD204B.

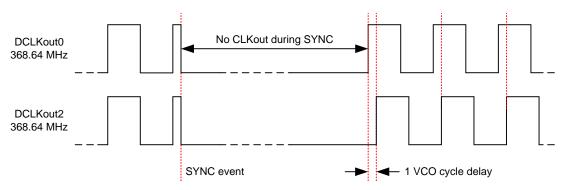

Figure 7. Fixed Digital Delay Example

Table 4 shows the recommended DCLKoutX_DDLY_CNTH and DCLKoutX_DDLY_CNTL alternate divide setting for delay by one VCO cycle. The clock will output high during the DCLKoutX_DDLY_CNTH time to permit a continuous output clock. The clock output will be low during the DCLKoutX_DDLY_CNTL time.

CLOCK DIVIDER	_CNTH			_CNTH	
2	2	3	17	9	9
3	3	4	18	9	10
4	2	3	19	10	10
5	3	3	20	10	11
6	3	4	21	11	11
7	4	4	22	11	12
8	4	5	23	12	12
9	5	5	24	12	13
10	5	6	25	13	13
11	6	6	26	13	14
12	6	7	27	14	14
13	7	7	28	14	15
14	7	8	29	15	15
15	8	8	30	15	16 ⁽¹⁾
16	8	9	31	16 ⁽¹⁾	16 ⁽¹⁾

Table 4. Recommended DCLKoutX_DDLY_CNTH/_CNTL Values for Delay by One VCO Cycle

(1) To achieve _CNTH/_CNTL value of 16, 0 must be programmed into the _CNTH/_CNTL field.

9.3.4 SYSREF to Device Clock Alignment

To ensure proper JESD204B operation, the timing relationship between the SYSREF and the Device clock must be adjusted for optimum setup and hold time. The ts_{JESD204B} defines the time between SYSREF and Device Clock for a specific condition of SYSREF divider and Device Clock digital delay. From this point, the SYSREF_DDLY. SDCLKoutY_DDLY, DCLKoutX_DDLY_CNTH, DCLKoutDDLY_CNTL, and DCLKoutX_MUX, SDCKLoutX_ADLY, and so forth, can be adjusted to provide the required setup and hold time between SYSREF and Device Clock.

It is possible to digitally adjust the SYSREF up to 20 VCO cycles before the SYSREF. So for example with a 2949.12-MHz VCO frequency, $t_{S_{JESD204B}} + 20 \times (1/VCO Frequency) = -80 \text{ ps} + 20 \times (1/2949.12 \text{ MHz}) = 6.7 \text{ ns}.$

9.3.5 Input Clock Switching

Manual, pin select, and automatic are three different kinds clock input switching modes can be set with the CLKin_SEL_MODE register.

The following subsections have information about how the active input clock is selected and what causes a switching event in the various clock input selection modes.

9.3.5.1 Input Clock Switching - Manual Mode

When CLKin_SEL_MODE is 0, 1, or 2 then CLKin0, CLKin1, or CLKin2, respectively, is always selected as the active input clock. Manual mode will also override the EN_CLKinX bits such that the CLKinX buffer will operate even if CLKinX is disabled with EN_CLKinX = 0.

If holdover is entered in this mode, then the device will relock to the selected CLKin upon holdover exit.

9.3.5.2 Input Clock Switching - Pin Select Mode

When CLKin_SEL_MODE is 3, the pins CLKin_SEL0 and CLKin_SEL1 select which clock input is active.

9.3.5.2.1 Configuring Pin Select Mode

The CLKin_SEL0_TYPE must be programmed to an input value for the CLKin_SEL0 pin to function as an input for pin select mode.

The CLKin_SEL1_TYPE must be programmed to an input value for the CLKin_SEL1 pin to function as an input for pin select mode.

If the CLKin_SELX_TYPE is set as output, the pin input value is considered *Low*.

The polarity of CLKin_SEL0 and CLKin_SEL1 input pins can be inverted with the CLKin_SEL_INV bit.

Table 5 defines which input clock is active depending on CLKin_SEL0 and CLKin_SEL1 state.

PIN CLKin_SEL1	PIN CLKin_SEL0	ACTIVE CLOCK
Low	Low	CLKin0
Low	High	CLKin1
High	Low	CLKin2
High	High	Holdover

Table 5. Active Clock Input - Pin Select Mode, CLKin_SEL_INV = 0

The pin select mode will override the EN_CLKinX bits such that the CLKinX buffer will operate even if CLKinX is disabled with EN_CLKinX = 0. To switch as fast as possible, keep the clock input buffers enabled (EN_CLKinX = 1) that could be switched to.

9.3.5.3 Input Clock Switching - Automatic Mode

When CLKin_SEL_MODE is 4, the active clock is selected in round-robin order of enabled clock inputs starting upon an input clock switch event. The switching order of the clocks is CLKin0 \rightarrow CLKin1 \rightarrow CLKin2 \rightarrow CLKin0, and so forth.

For a clock input to be eligible to be switched through, it must be enabled using EN_CLKinX.

9.3.5.3.1 Starting Active Clock

Upon programming this mode, the currently active clock remains active if PLL1 lock detect is high. To ensure a particular clock input is the active clock when starting this mode, program CLKin_SEL_MODE to the manual mode which selects the desired clock input (CLKin0, 1, or 2). Wait for PLL1 to lock PLL1_DLD = 1, then select this mode with CLKin_SEL_MODE = 4.

FXAS

NSTRUMENTS

www.ti.com

9.3.6 Digital Lock Detect

Both PLL1 and PLL2 support digital lock detect. Digital lock detect compares the phase between the reference path (R) and the feedback path (N) of the PLL. When the time error (and therefore the phase error) between the two signals is less than a window size (ϵ) specified by PLL1_WND_SIZE and PLL2_WND_SIZE, a lock detect count increments. When the lock detect count reaches a user specified value, PLL1_DLD_CNT or PLL2_DLD_CNT, lock detect is asserted true. Once digital lock detect is true, a single phase comparison outside the specified window will cause digital lock detect to be asserted false. This is illustrated in Figure 8.

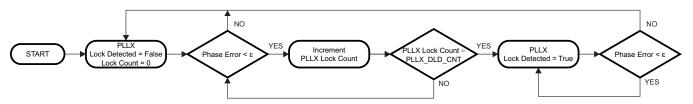

Figure 8. Digital Lock Detect Flowchart

This incremental lock detect count feature functions as a digital filter to ensure that lock detect isn't asserted for only a brief time when the phases of R and N are within the specified tolerance for only a brief time during initial phase lock.

See *Digital Lock Detect Frequency Accuracy* for more detailed information on programming the registers to achieve a specified frequency accuracy in ppm with lock detect.

The digital lock detect signal can be monitored on the Status_LD1 or Status_LD2 pin. The pin may be programmed to output the status of lock detect for PLL1, PLL2, or both PLL1 and PLL2.

NOTE

In cases where the period of the phase detector frequency approaches the value of the default PLL1_WND_SIZE increment (40 ns), the lock detect circuit will not function with the default value of PLL1_WND_SIZE. For phase detector frequencies at or above 25 MHz, TI recommends setting PLL1_WND_SIZE to 0x02 (19 ns) or a smaller value.

9.3.6.1 Calculating Digital Lock Detect Frequency Accuracy

See *Digital Lock Detect Frequency Accuracy* for more detailed information on programming the registers to achieve a specified frequency accuracy in ppm with lock detect.

The digital lock detect feature can also be used with holdover to automatically exit holdover mode. See *Exiting Holdover* for more information.

9.3.7 Holdover

Holdover mode causes PLL2 to stay locked on frequency with minimal frequency drift when an input clock reference to PLL1 becomes invalid. While in holdover mode, the PLL1 charge pump is TRI-STATED and a fixed tuning voltage is set on CPout1 to operate PLL1 in open-loop.

9.3.7.1 Enable Holdover

Program HOLDOVER_EN = 1 to enable holdover mode.

Holdover mode can be configured to set the CPout1 voltage upon holdover entry to a fixed user defined voltage or a tracked voltage.

9.3.7.1.1 Fixed (Manual) CPout1 Holdover Mode

By programming MAN_DAC_EN = 1, then the MAN_DAC value will be set on the CPout1 pin during holdover.

The user can optionally enable CPout1 voltage tracking (TRACK_EN = 1), read back the tracked DAC value, then reprogram MAN_DAC value to a user desired value based on information from previous DAC read backs. This allows the most user control over the holdover CPout1 voltage, but also requires more user intervention.

LMK04228 SNAS689A-OCTOBER 2017-REVISED JULY 2019

9.3.7.1.2 Tracked CPout1 Holdover Mode

By programming MAN_DAC_EN = 0 and TRACK_EN = 1, the tracked voltage of CPout1 will be set on the CPout1 pin during holdover. When the DAC has acquired the current CPout1 voltage, the *DAC_Locked* signal is set which may be observed on Status_LD1 or Status_LD2 pins by programming PLL1_LD_MUX or PLL2_LD_MUX respectively.

Updates to the DAC value for the Tracked CPout1 sub-mode occurs at the rate of the PLL1 phase detector frequency divided by (DAC_CLK_MULT × DAC_CLK_CNTR).

The DAC update rate should be programmed for \leq 100 kHz to ensure DAC holdover accuracy.

The ability to program slow DAC update rates, for example one DAC update per 4.08 seconds when using 1024kHz PLL1 phase detector frequency with DAC_CLK_MULT = 16,384 and DAC_CLK_CNTR = 255, allows the device to *look-back* and set CPout1 at the previous *good* CPout1 tuning voltage values before the event which caused holdover to occur.

The current voltage of DAC value can be read back using RB_DAC_VALUE, see RB_DAC_VALUE.

9.3.7.2 During Holdover

PLL1 is run in open-loop mode.

- PLL1 charge pump is set to TRI-STATE.
- PLL1 DLD will be unasserted.
- The HOLDOVER status is asserted
- During holdover If PLL2 was locked prior to entry of holdover mode, PLL2 DLD will continue to be asserted.
- CPout1 voltage will be set to:
 - a voltage set in the MAN_DAC register (MAN_DAC_EN = 1).
 - a voltage determined to be the last valid CPout1 voltage (MAN_DAC_EN = 0).
- PLL1 will attempt to lock with the active clock input.

The HOLDOVER status signal can be monitored on the Status_LD1 or Status_LD2 pin by programming the PLL1_DLD_MUX or PLL2_DLD_MUX register to *Holdover Status*.

9.3.7.3 Exiting Holdover

Holdover mode can be exited in one of two ways.

- Manually by programming the device from the host.
- Automatically by a clock operating within a specified ppm of the current PLL1 frequency on the active clock input.

9.3.7.4 Holdover Frequency Accuracy and DAC Performance

When in holdover mode, PLL1 will run in open-loop and the DAC will set the CPout1 voltage. If Fixed CPout1 mode is used, then the output of the DAC will be a voltage dependant upon the MAN_DAC register. If Tracked CPout1 mode is used, then the output of the DAC will be the voltage at the CPout1 pin before holdover mode was entered. When using Tracked mode and MAN_DAC_EN = 1, during holdover the DAC value is loaded with the programmed value in MAN_DAC, not the tracked value.

When in Tracked CPout1 mode, the DAC has a worst-case tracking error of ± 2 LSBs once PLL1 tuning voltage is acquired. The step size is approximately 3.2 mV, therefore the VCXO frequency error during holdover mode caused by the DAC tracking accuracy is ± 6.4 mV × Kv, where Kv is the tuning sensitivity of the VCXO in use. Therefore, the accuracy of the system when in holdover mode in ppm is:

Holdover accuracy (ppm) =
$$\frac{\pm 6.4 \text{ mV} \times \text{Kv} \times 1e6}{\text{VCXO Frequency}}$$
 (1)

Example: consider a system with a 19.2-MHz clock input, a 153.6-MHz VCXO with a Kv of 17 kHz/V. The accuracy of the system in holdover in ppm is:

 $\pm 0.71 \text{ ppm} = \pm 6.4 \text{ mV} \times 17 \text{ kHz/V} \times 1e6 / 153.6 \text{ MHz}$

(2)

Take this frequency error into account when determining the allowable frequency error window to cause holdover mode to exit.

9.3.7.5 Holdover Mode - Automatic Exit of Holdover

The LMK048xx device can be programmed to automatically exit holdover mode when the accuracy of the frequency on the active clock input achieves a specified accuracy. The programmable variables include PLL1_WND_SIZE and DLD_HOLD_CNT.

See *Digital Lock Detect Frequency Accuracy* to calculate the register values to cause holdover to automatically exit upon reference signal recovery to within a user specified ppm error of the holdover frequency.

It is possible for the time to exit holdover to vary because the condition for automatic holdover exit is for the reference and feedback signals to have a time and phase error less than a programmable value. Because it is possible for two clock signals to be very close in frequency but not close in phase, it may take a long time for the phases of the clocks to align themselves within the allowable time and phase error before holdover exits.

LMK04228

SNAS689A-OCTOBER 2017-REVISED JULY 2019

9.4 Programming

LMK04228 devices are programmed using 24-bit registers. Each register consists of a 1-bit command field (R/W), a 2-bit multi-byte field (W1, W0), a 13-bit address field (A12 to A0) and a 8-bit data field (D7 to D0). The contents of each register is clocked in MSB first (R/W), and the LSB (D0) last. During programming, the CS* signal is held low. The serial data is clocked in on the rising edge of the SCK signal. After the LSB is clocked in, the CS* signal goes *high* to latch the contents into the shift register. It is recommended to program registers in numeric order -- for example, 0x000 to 0x1FFF -- to achieve proper device operation. Each register consists of one or more fields which control the device functionality. See electrical characteristics and Figure 1 for timing details.

R/W bit = 0 is for SPI write. R/W bit = 1 is for SPI read.

W1 and W0 shall be written as 0.

9.4.1 Recommended Programming Sequence

Registers are programmed in numeric order with 0x000 being the first and 0x1FFF being the last register programmed. TI recommends the following programming sequence:

- 1. Program register 0x000 with RESET = 1.
- 2. Program registers in ascending order from 0x000 to 0x165. Unused or unchanged registers can be skipped, and will remain at default POR values.
- 3. Program register 0x171 to 0xAA and 0x172 to 0x02.
- 4. Program registers 0x17C and 0x17D.
- 5. Program registers 0x166 to 0x1FFF.

Program register 0x17C (OPT_REG_1) and 0x17D (OPT_REG_2) before programming PLL2 in registers: 0x166, 0x167, and 0x168 to optimize VCO1 phase noise performance over temperature.

9.4.1.1 SPI LOCK

When writing to SPI_LOCK, registers 0x1FFD, 0x1FFE, and 0x1FFF should all always be written sequentially.

9.4.1.2 SYSREF_CLR

When using SYSREF output, SYSREF local digital delay block should be cleared using SYSREF_CLR bit. See SYSREF_CLR for more information.

9.5 Register Maps

9.5.1 Register Map for Device Programming

Table 6 provides the register map for device programming. Any register can be read from the same data address it is written to.

9.5.2 Device Register Descriptions

The following section details the fields of each register, the poweron-reset (POR) defaults, and specific descriptions of each bit.

In some cases similar fields are located in multiple registers. In this case specific outputs may be designated as X or Y. In these cases the X will represent even numbers from 0 to 12 and the Y will represent odd numbers from 1 to 13. In the case where X and Y are both used in a bit name, then Y = X + 1.

9.5.2.1 System Functions

9.5.2.1.1 RESET, SPI_3WIRE_DIS

This register contains the RESET function.

Table 7. Register 0x000

BIT	NAME	POR DEFAULT	DESCRIPTION
7	RESET	0	0: Normal Operation 1: Reset (automatically cleared)
6:5	NA	0	Reserved
4	SPI_3WIRE_DIS	0	Disable 3 wire SPI mode. 4 Wire SPI mode is enabled by selecting SPI Read back in one of the output MUX settings. For example CLKin0_SEL_MUX. 0: 3 Wire Mode enabled 1: 3 Wire Mode disabled
3:0	NA	NA	Reserved

9.5.2.1.2 POWERDOWN

This register contains the POWERDOWN function.

Table 8. Register 0x002

BIT	NAME	POR DEFAULT	DESCRIPTION	
7:1	NA	0	Reserved	
0	POWERDOWN	0	0: Normal Operation 1: Powerdown	

9.5.2.1.3 ID_DEVICE_TYPE

This register contains the product device type. This is read only register.

Table 9. Register 0x003

віт	NAME	POR DEFAULT	DESCRIPTION
7:0	ID_DEVICE_TYPE	6	PLL product device type.

9.5.2.1.4 ID_PROD[15:8], ID_PROD

These registers contain the product identifier. This is read only register.

Table 10. ID_PROD Register Configuration, ID_PROD[15:0]

MSB	LSB	
0x004[7:0]	0x005[7:0]	

Table 11. Registers 0x004, 0x005

BIT	REGISTERS	FIELD NAME	POR DEFAULT	DESCRIPTION
7:0	0x004	ID_PROD[15:8]	208	MSB of the product identifier.
7:0	0x005	ID_PROD	91	LSB of the product identifier.

9.5.2.1.5 ID_MASKREV

This register contains the IC version identifier. This is read only register.

Table 12. Register 0x006

BIT	NAME	POR DEFAULT	DESCRIPTION
7:0	ID_MASKREV	32	IC version identifier for LMK04228

9.5.2.1.6 ID_VNDR[15:8], ID_VNDR

These registers contain the vendor identifier. This is read only register.

Table 13. ID_VNDR Register Configuration, ID_VNDR[15:0]

MSB	LSB	
0x00C[7:0]	0x00D[7:0]	

Table 14. Registers 0x00C, 0x00D

BIT	REGISTERS	NAME	POR DEFAULT	DESCRIPTION
7:0	0x00C	ID_VNDR[15:8]	81	MSB of the vendor identifier.
7:0	0x00D	ID_VNDR	4	LSB of the vendor identifier.

9.5.2.2 (0x100 - 0x138) Device Clock and SYSREF Clock Output Controls

9.5.2.2.1 CLKoutX_Y_ODL, CLKoutX_Y_IDL, DCLKoutX_DIV

These registers control the input and output drive level as well as the device clock out divider values.

Table 15. Registers 0x100, 0x108, 0x110, 0x118, 0x120, 0x128, and 0x130

BIT	NAME	POR DEFAULT	DESCRIPTION		
7	NA	0	Reserved		
6	CLKoutX_Y_ODL	0	Output drive level.		
5	CLKoutX_Y_IDL	0	Input drive level.		
	DCLKoutX_DIV	$X = 0 \rightarrow 2$ $X = 2 \rightarrow 4$ $X = 4 \rightarrow 8$ $X = 6 \rightarrow 8$ $X = 8 \rightarrow 8$ $X = 10 \rightarrow 8$ $X = 12 \rightarrow 2$	DCLKoutX_DIV sets the divide value for the clock output, the divide may be even or odd. Both even or odd divides output a 50% duty cycle clock if duty cycle correction (DCC) is selected. Divider is unused if DCLKoutX_MUX = 2 (bypass), equivalent divide of 1.		
			Field Value	Divider Value	
4:0			0 (0x00)	32	
4.0			1 (0x01)	1 ⁽¹⁾	
			2 (0x02)	2	
			30 (0x1E)	30	
			31 (0x1F)	31	

(1) Not valid if DCLKoutX_MUX = 0, Divider only. Not valid if DCLKoutX_MUX = 3 (Analog Delay + Divider) and DCLKoutX_ADLY_MUX = 0 (without duty cycle correction/halfstep).

9.5.2.2.2 DCLKoutX_DDLY_CNTH, DCLKoutX_DDLY_CNTL

This register controls the digital delay high and low count values for the device clock outputs.

Table 16. Registers 0x101, 0x109, 0x111, 0x119, 0x121, 0x129, 0x131

BIT	NAME	POR DEFAULT	DESCRIPTION	
			Number of clock cycles the output will be high v	when digital delay is engaged.
			Field Value	Delay Values
		5	0 (0x00)	16
7:4	DCLKoutX _DDLY_CNTH		1 (0x01)	Reserved
			2 (0x02)	2
			15 (0x0F)	15
		5	Number of clock cycles the output will be low when digital delay is engaged.	
			Field Value	Delay Values
			0 (0x00)	16
3:0	DCLKoutX _DDLY_CNTL		1 (0x01)	Reserved
			2 (0x02)	2
			15 (0x0F)	15

STRUMENTS

XAS

9.5.2.2.3 DCLKoutX_ADLY, DCLKoutX_ADLY_MUX, DCLKout_MUX

These registers control the analog delay properties for the device clocks.

BIT	NAME	POR DEFAULT	DESCRIPTION		
			Device clock analog delay value. Setting this additional to the delay of each 25 ps step. Eff		
			Field Value	Delay Value	
			0 (0x00)	0 ps	
7:3	DCLKoutX_ALDY	0	1 (0x01)	25 ps	
			2 (0x02)	50 ps	
			23 (0x17)	575 ps	
2	DCLKoutX_ADLY _MUX	0	This register selects the input to the analog delay for the device clock. Used when DCLKoutX_MUX = 3. 0: Divided without duty cycle correction or half step. ⁽¹⁾ 1: Divided with duty cycle correction and half step.		
			This selects the input to the device clock buff	er.	
			Field Value	Mux Output	
		0	0 (0x0)	Divider only ⁽¹⁾	
1:0	DCLKoutX_MUX		1 (0x1)	Divider with Duty Cycle Correction and Half Step	
			2 (0x2)	Reserved	
			3 (0x3)	Analog Delay + Divider	

Table 17. Registers 0x103, 0x10B, 0x113, 0x11B, 0x123, 0x12B, 0x133

(1) DCLKoutX_DIV = 1 is not valid.

9.5.2.2.4 DCLKoutX_HS, SDCLKoutY_MUX, SDCLKoutY_DDLY, SDCLKoutY_HS

These registers set the half step for the device clock, the SYSREF output MUX, the SYSREF clock digital delay, and half step.

BIT	NAME	POR DEFAULT	DESCRIPTION		
7	NA	0	Reserved		
6	DCLKoutX_HS	0	Sets the device clock half step value. Half step must be zero (0) for a divide of 1. 0: 0 cycles 1: -0.5 cycles		
5	SDCLKoutY_MUX	0	Sets the input the the SDCLKoutY outputs. 0: Device clock output 1: SYSREF output		
			Sets the number of VCO cycles to delay the SDCLKout by.		
			Field Value	Delay Cycles	
			0 (0x00)	Bypass	
4:1	SDCLKoutY_DDLY		1 (0x01)	2	
4.1		0	2 (0x02)	3	
			10 (0x0A)	11	
			11 to 15 (0x0B to 0x0F)	Reserved	
0	SDCLKoutY_HS	0	Sets the SYSREF clock half step value. 0: 0 cycles 1: -0.5 cycles		

Table 18. Registers 0x104, 0x10C, 0x114, 0x11C, 0x124, 0x12C, 0x134

9.5.2.2.5 SDCLKoutY_ADLY_EN, SDCLKoutY_ADLY

These registers set the analog delay parameters for the SYSREF outputs.

Table 19. Registers 0x105, 0x10D, 0x115, 0x11D, 0x125, 0x12D, 0x135

BIT	NAME	POR DEFAULT	DESCRIPTION	
7:5	NA	0	Reserved	
4	SDCLKoutY _ADLY_EN	0	Enables analog delay for the SYSREF output. 0: Disabled 1: Enabled	
			Sets the analog delay value for the SYSREF c additional 700 ps in propagation delay. Effective	
			Field Value	Delay Value
			0 (0x0)	0 ps
	SDCLKoutY	CL KoutY	1 (0x1)	600 ps
3:0	_ADLY	0	2 (0x2)	750 ps (+150 ps from 0x1)
			3 (0x3)	900 ps (+150 ps from 0x2)
			14 (0xE)	2550 ps (+150 ps from 0xD)
			15 (0xF)	2700 ps (+150 ps from 0xE)

9.5.2.2.6 DCLKoutX_DDLY_PD, DCLKout_ADLY_PD, DCLKoutX_Y_PD, SDCLKoutY_DIS_MODE, SDCLKoutY_PD

This register controls the power down functions for the digital delay, analog delay, outputs, and SYSREF disable modes.

BIT	NAME	POR DEFAULT	DES	CRIPTION		
7	DCLKoutX _DDLY_PD	0	Powerdown the device clock digital delay circuitry. 0: Enabled 1: Powerdown			
6:5	NA	3	These bits should always be programme	d to 1 (Bit 6 = 1, Bit 5 = 1).		
4	DCLKoutX _ADLY_PD	1	Powerdown the device clock analog dela 0: Enabled 1: Powerdown	y feature.		
3	CLKoutX_Y_PD	$\begin{array}{c} X_{-}Y = 0_{-}1 \rightarrow 1 \\ X_{-}Y = 2_{-}3 \rightarrow 1 \\ X_{-}Y = 4_{-}5 \rightarrow 0 \\ X_{-}Y = 6_{-}7 \rightarrow 0 \\ X_{-}Y = 8_{-}9 \rightarrow 0 \\ X_{-}Y = 10_{-}11 \rightarrow 0 \\ X_{-}Y = 12_{-}13 \rightarrow 1 \end{array}$	Powerdown the clock group defined by X and Y. 0: Enabled 1: Powerdown			
			Configures the output state of the SYSREF			
			Field Value	Disable Mode		
			0 (0x00)	Active in normal operation		
2:1	SDCLKoutY _DIS_MODE	0	1 (0x01)	If SYSREF_GBL_PD = 1, the output is a logic low, otherwise it is active.		
				2 (0x02)	If SYSREF_GBL_PD = 1, the output is a nominal Vcm voltage ⁽¹⁾ , otherwise it is active.	
			3 (0x03)	Output is a nominal Vcm voltage ⁽¹⁾		
0	SDCLKoutY_PD	1	Powerdown SDCLKoutY and set to the s	tate defined by SDCLKoutY_DIS_MODE		

Table 20. Registers 0x106, 0x10E, 0x116, 0x11E, 0x126, 0x12E, 0x136

(1) If LVPECL mode is used with emitter resistors to ground, the output Vcm will be ~0 V, each pin will be ~0 V.

9.5.2.2.7 SDCLKoutY_POL, SDCLKoutY_FMT, DCLKoutX_POL, DCLKoutX_FMT

These registers configure the output polarity, and format.

BIT	NAME	POR DEFAULT	DESCRIPTION	
7	SDCLKoutY_POL	0	Sets the polarity of clock on SDCLKoutY when device clock output is selected with SDCLKoutY_MUX. 0: Normal 1: Inverted	
			Sets the output format of the SYSREF clock	S
			Field Value	Output Format
			0 (0x00)	Powerdown

XAS

9.5.2.3.5 SYSREF_PULSE_CNT

This register sets the number of SYSREF pulses if SYSREF is not in continuous mode. See SYSREF_CLKin0_MUX, SYSREF_MUX for further description of SYSREF's outputs.

Programming the register causes the specified number of pulses to be output if "SYSREF Pulses" is selected by SYSREF_MUX and SYSREF functionality is powered up.

Table	28.	Register	0x13E
-------	-----	----------	-------

BIT	NAME	POR DEFAULT	DESCRI	PTION
7:2	NA	0	Reserved	
	1:0 SYSREF PULSE CNT		Sets the number of SYSREF pulses generate See SYSREF_CLKin0_MUX, SYSREF_MUX	ed when not in continuous mode. (for more information on SYSREF modes.
		SREF_PULSE_CNT 3	Field Value	Number of Pulses
1:0			0 (0x00)	1 pulse
			1 (0x01)	2 pulses
			2 (0x02)	4 pulses
			3 (0x03)	8 pulses

9.5.2.3.6 PLL1_PD, VCO_LDO_PD, VCO_PD, OSCin_PD, SYSREF_GBL_PD, SYSREF_PD, SYSREF_DDLY_PD, SYSREF_PLSR_PD

This register contains powerdown controls for OSCin and SYSREF functions.

Table 29. Register 0x140

BIT	NAME	POR DEFAULT	DESCRIPTION
7	PLL1_PD	0	Powerdown PLL1 0: Normal operation 1: Powerdown
6	VCO_LDO_PD	0	Powerdown VCO_LDO 0: Normal operation 1: Powerdown
5	VCO_PD	0	Powerdown VCO 0: Normal operation 1: Powerdown
4	OSCin_PD	0	Powerdown the OSCin port. 0: Normal operation 1: Powerdown
3	SYSREF_GBL_PD	0	Powerdown individual SYSREF outputs depending on the setting of SDCLKoutY_DIS_MODE for each SYSREF output. SYSREF_GBL_PD allows many SYSREF outputs to be controlled through a single bit. 0: Normal operation 1: Activate Powerdown Mode
2	SYSREF_PD	1	Powerdown the SYSREF circuitry and divider. If powered down, SYSREF output mode cannot be used. SYNC cannot be provided either. 0: SYSREF can be used as programmed by individual SYSREF output registers. 1: Powerdown
1	SYSREF_DDLY_PD	1	Powerdown the SYSREF digital delay circuitry. 0: Normal operation, SYSREF digital delay may be used. Must be powered up during SYNC for deterministic phase relationship with other clocks. 1: Powerdown
0	SYSREF_PLSR_PD	1	Powerdown the SYSREF pulse generator. 0: Normal operation 1: Powerdown

9.5.2.3.7 SYSREF_CLR, SYNC_1SHOT_EN, SYNC_POL, SYNC_EN, SYNC_PLL2_DLD, SYNC_PLL1_DLD, SYNC_MODE

This register sets general SYNC parameters such as polarization, and mode. Refer to Figure 6 for block diagram. Refer to Table 2 for using SYNC_MODE for specific SYNC use cases.

BIT	NAME	POR DEFAULT	DESCRIPTION		
7	SYSREF_CLR	1	Except during SYSREF Setup Procedure (see SYNC/SYSREF), this bit should always be programmed to 0. While this bit is set, extra current is used. Refer to Table 82.		
6	SYNC_1SHOT_EN	0	SYNC one shot enables edge sensitive SYNC. 0: SYNC is level sensitive and outputs will be held in SYNC as long as SYNC is asserted. 1: SYNC is edge sensitive, outputs will be SYNCed on rising edge of SYNC. This results in the clock being held in SYNC for a minimum amount of time.		
5	SYNC_POL	0	Sets the polarity of the SYNC pin. 0: Normal 1: Inverted		
4	SYNC_EN	1	Enables the SYNC functionality. 0: Disabled 1: Enabled		
3	SYNC_PLL2_DLD	0	0: Off 1: Assert SYNC until PLL2 DLD = 1		
2	SYNC_PLL1_DLD	0	0: Off 1: Assert SYNC until PLL1 DLD = 1		
			Sets the method of generating a SYNC event.		
			Field Value	SYNC Generation	
			0 (0x00)	Prevent SYNC Pin, SYNC_PLL1_DLD flag, or SYNC_PLL2_DLD flag from generating a SYNC event.	
1.0		4	1 (0x01)	SYNC event generated from SYNC pin or if enabled the SYNC_PLL1_DLD flag or SYNC_PLL2_DLD flag.	
1:0	SYNC_MODE	SYNC_MODE 1	2 (0x02)	For use with pulser - SYNC/SYSREF pulses are generated by pulser block via SYNC Pin or if enabled SYNC_PLL1_DLD flag or SYNC_PLL2_DLD flag.	
				3 (0x03)	For use with pulser - SYNC/SYSREF pulses are generated by pulser block when programming register 0x13E (SYSREF_PULSE_CNT) is written to (see SYSREF_PULSE_CNT).

LMK04228 SNAS689A-OCTOBER 2017-REVISED JULY 2019

9.5.2.3.8 SYNC_DISSYSREF, SYNC_DISX

SYNC_DISX will prevent a clock output from being synchronized or interrupted by a SYNC event or when outputting SYSREF.

BIT	NAME	POR DEFAULT	DESCRIPTION				
7	SYNC_DISSYSREF	0	Prevent the SYSREF clocks from becoming synchronized during a SYNC event. If SYNC_DISSYSREF is enabled it will continue to operate normally during a SYNC event.				
6	SYNC_DIS12	0					
5	SYNC_DIS10	0					
4	SYNC_DIS8	0	Prevent the device clock output from becoming synchronized during a SYNC event or				
3	SYNC_DIS6	0	SYSREF clock. If SYNC_DIS bit for a particular output is enabled then it will continue to				
2	SYNC_DIS4	0	operate normally during a SYNC event or SYSREF clock.				
1	SYNC_DIS2	0					
0	SYNC_DIS0	0					

Table 31. Register 0x144

9.5.2.3.9 Fixed Register

9.5.2.6 (0x14B - 0x152) Holdover

9.5.2.6.1 LOS_TIMEOUT, LOS_EN, TRACK_EN, HOLDOVER_FORCE, MAN_DAC_EN, MAN_DAC[9:8]

This register contains the holdover functions.

BIT	NAME	POR DEFAULT	DESCRIPTION		
			This controls the amount of time in which no a event.	This controls the amount of time in which no activity on a CLKin forces a clock switch event.	
			Field Value	Timeout	
7:6	LOS_TIMEOUT	0	0 (0x00)	370 kHz	
			1 (0x01)	2.1 MHz	
			2 (0x02)	8.8 MHz	
			3 (0x03)	22 MHz	
5	LOS_EN	0	Enables the LOS (Loss-of-Signal) timeout control. Valid for MOS clock inputs. 0: Disabled 1: Enabled		
4	TRACK_EN	1	Enable the DAC to track the PLL1 tuning voltage, optionally for use in holdover mode. After device reset, tracking starts at DAC code = 512. Tracking can be used to monitor PLL1 voltage in any mode. 0: Disabled 1: Enabled, will only track when PLL1 is locked.		
3	HOLDOVER _FORCE	0	This bit forces holdover mode. When holdover mode is forced, if MAN_DAC_EN = 1, then the DAC will set the programmed MAN_DAC value. Otherwise the tracked DAC value will set the DAC voltage. 0: Disabled 1: Enabled.		
2	MAN_DAC_EN	1	This bit enables the manual DAC mode. 0: Automatic 1: Manual		
1:0	MAN_DAC[9:8]	2	See MAN_DAC[9:8], MAN_DAC[7:0] for more	e information on the MAN_DAC settings.	

9.5.2.6.2 MAN_DAC[9:8], MAN_DAC[7:0]

These registers set the value of the DAC in holdover mode when used manually.

9.5.2.8.2 PLL2_P, OSCin_FREQ, PLL2_XTAL_EN, PLL2_REF_2X_EN

This register sets other PLL2 functions.

віт	NAME	POR DEFAULT	DESCRIPTION		
			The PLL2 N Prescaler divides the output of the VCO as selected by Mode_MUX1 and is connected to the PLL2 N divider.		
			Field Value	Value	
			0 (0x00)	8	
			1 (0x01)	2	
7:5	PLL2_P	2	2 (0x02)	2	
			3 (0x03)	3	
			4 (0x04)	4	
			5 (0x05)	5	
			6 (0x06)	6	
			7 (0x07)	7	
			The frequency of the PLL2 reference input to the PLL2 Phase Detector (OSCin/OSCin* port) must be programmed in order to support proper operation of the frequency calibratic routine which locks the internal VCO to the target frequency.		
			Field Value	OSCin Frequency	
			0 (0x00)	0 to 63 MHz	
4:2	OSCin_FREQ	FREQ 7	1 (0x01)	>63 MHz to 127 MHz	
			2 (0x02)	>127 MHz to 255 MHz	
			3 (0x03)	Reserved	
1			4 (0x04)	>255 MHz to 500 MHz	
			5 (0x05) to 7(0x07)	Reserved	
1	PLL2_XTAL_EN	0	If an external crystal is being used to implement a discrete VCXO, the internal feedback amplifier must be enabled with this bit in order to complete the oscillator circuit. 0: Oscillator Amplifier Disabled 1: Oscillator Amplifier Enabled		
0	PLL2_REF_2X_EN	1	Enabling the PLL2 reference frequency doubler allows for higher phase detector frequencies on PLL2 than would normally be allowed with the given VCXO or Crystal frequency. Higher phase detector frequencies reduces the PLL N values which makes the design wider loop bandwidth filters possible. 0: Doubler Disabled 1: Doubler Enabled

7:3	N/A	Reserved
2	RB_PLL2_LD_LOST	This is set when PLL2 DLD edge falls. Does not set if cleared while PLL2 DLD is low.
1	RB_PLL2_LD	Read back 0: PLL2 DLD is low. Read back 1: PLL2 DLD is high.
0	CLR_PLL2_LD_LOST	To reset RB_PLL2_LD_LOST, write CLR_PLL2_LD_LOST with 1 and then 0. 0: RB_PLL2_LD_LOST will be set on next falling PLL2 DLD edge. 1: RB_PLL2_LD_LOST is held clear (0). User must clear this bit to allow RB_PLL2_LD_LOST to become set again.

9.5.2.9.8 RB_DAC_VALUE(MSB), RB_CLKinX_SEL, RB_CLKinX_LOS

This register provides read back access to CLKinX selection indicator and CLKinX LOS indicator. The 2 MSBs are shared with the RB_DAC_VALUE. See RB_DAC_VALUE section.

Table 76. Register 0x184

BIT	NAME	DESCRIPTION
7:6	RB_DAC_VALUE[9:8]	See RB_DAC_VALUE section.
5	RB_CLKin2_SEL	Read back 0: CLKin2 is not selected for input to PLL1. Read back 1: CLKin2 is selected for input to PLL1.
4	RB_CLKin1_SEL	Read back 0: CLKin1 is not selected for input to PLL1. Read back 1: CLKin1 is selected for input to PLL1.
3	RB_CLKin0_SEL	Read back 0: CLKin0 is not selected for input to PLL1. Read back 1: CLKin0 is selected for input to PLL1.
2	N/A	
1	RB_CLKin1_LOS	Read back 1: CLKin1 LOS is active. Read back 0: CLKin1 LOS is not active.
0	RB_CLKin0_LOS	Read back 1: CLKin0 LOS is active. Read back 0: CLKin0 LOS is not active.

9.5.2.9.9 RB_DAC_VALUE

Contains the value of the DAC for user readback.

Table 77. RB_DAC_VALUE Register Configuration, RB_DAC_VALUE[7:0]

Field Name	MSB	LSB

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

To assist customers in frequency planning and design of loop filters, Texas Instrument's provides the Clock Design Tool (www.ti.com/tool/clockdesigntool) and Clock Architect (www.ti.com/clockarchitect).

10.1.1 Digital Lock Detect Frequency Accuracy

The digital lock detect circuit is used to determine PLL1 locked, PLL2 locked, and holdover exit events. A window size and lock count register are programmed to set a ppm frequency accuracy of reference to feedback signals of the PLL for each event to occur. When a PLL digital lock event occurs, the corresponding PLL digital lock detect is asserted true. When the holdover exit event occurs, the device will exit holdover mode.

EVENT	PLL	WINDOW SIZE	LOCK COUNT
PLL1 Locked	PLL1	PLL1_WND_SIZE	PLL1_DLD_CNT
PLL2 Locked	PLL2	PLL2_WND_SIZE	PLL2_DLD_CNT
Holdover Exit	PLL1	PLL1_WND_SIZE	HOLDOVER_DLD_CNT

For a digital lock detect event to occur there must be a *lock count* number of phase detector cycles of PLLX during which the time/phase error of the PLLX_R reference and PLLX_N feedback signal edges are within the user programmable *window size*. Because there must be at least *lock count* phase detector events before a lock event occurs, a minimum digital lock event time can be calculated as *lock count* / f_{PDX} where X = 1 for PLL1 or 2 for PLL2.

By using Equation 3, values for a *lock count* and *window size* can be chosen to set the frequency accuracy required by the system in ppm before the digital lock detect event occurs:

 $ppm = \frac{1e6 \times PLLX_WND_SIZE \times f_{PDX}}{PLLX_DLD_CNT}$

(3)

The effect of the *lock count* value is that it shortens the effective lock window size by dividing the *window size* by *lock count*.

If at any time the PLLX_R reference and PLLX_N feedback signals are outside the time window set by *window size*, then the *lock count* value is reset to 0.

NOTE

In cases where the period of the phase detector frequency approaches the value of the default PLL1_WND_SIZE increment (40 ns), the lock detect circuit will not function with the default value of PLL1_WND_SIZE. For phase detector frequencies at or above 25 MHz, TI recommends setting PLL1_WND_SIZE to 0x02 (19 ns) or a smaller value.

10.1.1.1 Minimum Lock Time Calculation Example

To calculate the minimum PLL2 digital lock time given a PLL2 phase detector frequency of 40 MHz and PLL2_DLD_CNT = 10,000. Then the minimum lock time of PLL2 will be 10,000 / 40 MHz = 250 µs.

10.1.2 Driving CLKin AND OSCin Inputs

10.1.2.1 Driving CLKin PINS With a Differential Source

Both CLKin ports can be driven by differential signals. TI recommends setting the input mode to bipolar (CLKinX_BUF_TYPE = 0) when using differential reference clocks. The LMK04228 internally biases the input pins so the differential interface should be AC coupled. The recommended circuits for driving the CLKin pins with either LVDS or LVPECL are shown in Figure 9 and Figure 10.

Copyright © 2017, Texas Instruments Incorporated

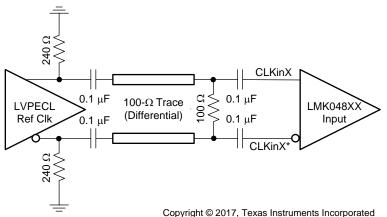

Figure 10. CLKinX/X* Termination for an LVPECL Reference Clock Source

Finally, a reference clock source that produces a differential sine wave output can drive the CLKin pins using the following circuit. Note: the signal level must conform to the requirements for the CLKin pins listed in *Electrical Characteristics*.

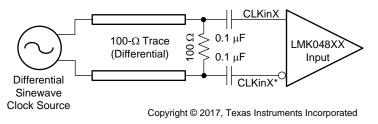

Figure 11. CLKinX/X* Termination for a Differential Sinewave Reference Clock Source

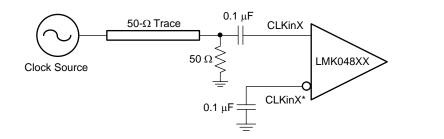

10.1.2.2 Driving CLKin Pins With a Single-Ended Source

The CLKin pins of the LMK04228 can be driven using a single-ended reference clock source, for example, either a sine wave source or an LVCMOS/LVTTL source. Either AC coupling or DC coupling may be used. In the case of the sine wave source that is expecting a $50-\Omega$ load, TI recommends that AC coupling be used as shown in the circuit below with a $50-\Omega$ termination.

NOTE

The signal level must conform to the requirements for the CLKin pins listed in *Electrical Characteristics*. CLKinX_BUF_TYPE is recommended to be set to bipolar mode (CLKinX_BUF_TYPE = 0).

Copyright © 2017, Texas Instruments Incorporated

Figure 12. CLKinX/X* Single-Ended Termination

If the CLKin pins are being driven with a single-ended LVCMOS/LVTTL source, either DC coupling or AC coupling may be used. If DC coupling is used, the CLKinX_BUF_TYPE should be set to MOS buffer mode (CLKinX_BUF_TYPE = 1) and the voltage swing of the source must meet the specifications for DC-coupled, MOS-mode clock inputs given in *Electrical Characteristics*. If AC coupling is used, the CLKinX_BUF_TYPE should be set to the bipolar buffer mode (CLKinX_BUF_TYPE = 0). The voltage swing at the input pins must meet the specifications for AC-coupled, bipolar mode clock inputs given in *Electrical Characteristics*. In this case, some attenuation of the clock input level may be required. A simple resistive divider circuit before the AC-coupling capacitor is sufficient.

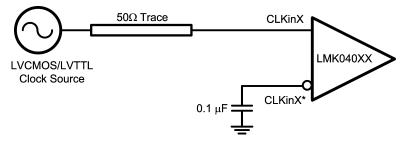

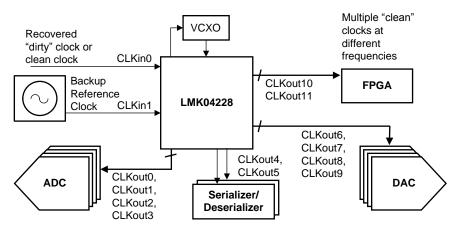

Figure 13. DC-Coupled LVCMOS/LVTTL Reference Clock

LMK04228 SNAS689A – OCTOBER 2017 – REVISED JULY 2019

10.2 Typical Application

This design example highlights using the available tools to design loop filters and create programming map for LMK04228.

Copyright © 2017, Texas Instruments Incorporated

Figure 14. Typical Application

10.2.1 Design Requirements

Clocks outputs:

- 1x 245.76-MHz clock for JESD204B ADC, LVPECL.
- This clock requires the best performance in this example.
- 2x 983.04-MHz clock for JESD204B DAC, LVPECL.
- 1x 122.88-MHz clock for JESD204B FPGA block, LVDS
- 3x 10.24-MHz SYSREF for ADC (LVPECL), DAC (LVPECL), FPGA (LVDS).
- 2x 122.88-MHz clock for FPGA, LVDS

For best performance, the highest possible phase detector frequency is used at PLL2. As such, a 122.88-MHz VCXO is used.

10.2.2 Detailed Design Procedure

10.2.2.1 Device Programming

TICS Pro register programming tool exposes the registers for the LMK04228 (and many other TI products) using block diagrams to demonstrate the purpose and location of register settings. By connecting a USB2ANY programmer to the SPI inputs of the device, TICS Pro can update register configurations in real time for rapidly validating desired configurations.

Frequency planning for assignment of outputs:

- To minimize crosstalk perform frequency planning / CLKout assignments to keep common frequencies on outputs close together.
- It is best to place common device clock output frequencies on outputs sharing the same V_{CC} group, for example, these outputs share Vcc4_CG2. Refer to *Pin Configuration and Functions* to see the V_{CC} groupings the clock outputs.

In this example, the 245.76-MHz ADC output needs the best performance. DCLKout2 on the LMK04228 provides the best noise floor / performance. The 245.76 MHz will be placed on DCLKout2 with 10.24-MHz SYSREF on SDCLKout3.

• For best performance the input and output drive level bits may be set. Best noise floor performance is achieved with DCLKout2_IDL = 1 and DCLKout2_ODL = 1.

In this example, the 983.04-MHz DAC output is placed on DCLKout4 and DCLKout6 with 10.24-MHz SYSREF on paired SDCLKout5 and SDCLKout7 outputs.

Typical Application (continued)

• These outputs share Vcc4_CG2.

In this example, the 122.88-MHz FPGA JESD204B output is placed on DCLKout10 with 10.24-MHz SYSREF on paired SDCLKout11 output.

Additionally, the 122.88-MHz FPGA non-JESD204B outputs are placed on DCLKout8 and SDCLKout9.

• When frequency planning, consider PLL2 as a clock output at the phase detector frequency. As such, these 122.88-MHz outputs have been placed on the outputs close to the PLL2 and Charge Pump power supplies.

Once the device programming is completed as desired in TICS Pro, the register settings can be exported for use with other programming controllers.

10.3 Do's and Don'ts

10.3.1 Pin Connection Recommendations

- V_{CC} Pins and Decoupling: all V_{CC} pins must always be connected, including for unused clock output groups.
- Unused Clock Outputs: leave unused clock outputs floating and powered down. Use the appropriate registers to power down unused clock outputs.
- Unused Clock Inputs: unused clock inputs can be left floating.

POWER

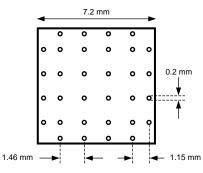

12 Layout

12.1 Layout Guidelines

12.1.1 Thermal Management

Power consumption of the LMK04228 of devices can be high enough to require attention to thermal management. For reliability and performance reasons the die temperature should be limited to a maximum of 125°C. That is, as an estimate, T_A (ambient temperature) plus device power consumption times $R_{\theta JA}$ should not exceed 125°C.

The package of the device has an exposed pad that provides the primary heat removal path as well as excellent electrical grounding to a printed-circuit board. To maximize the removal of heat from the package, a thermal land pattern including multiple vias to a ground plane must be incorporated on the PCB within the footprint of the package. The exposed pad must be soldered down to ensure adequate heat conduction out of the package.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LMK04228NKDR	ACTIVE	WQFN	NKD	64	2000	RoHS & Green	SN	Level-3-260C-168 HR	-40 to 85	K04228NKD	Samples
LMK04228NKDT	ACTIVE	WQFN	NKD	64	250	RoHS & Green	SN	Level-3-260C-168 HR	-40 to 85	K04228NKD	Samples

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <= 1000ppm threshold. Antimony trioxide based flame retardants must also meet the <= 1000ppm threshold requirement.

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
