1. Design Specifications

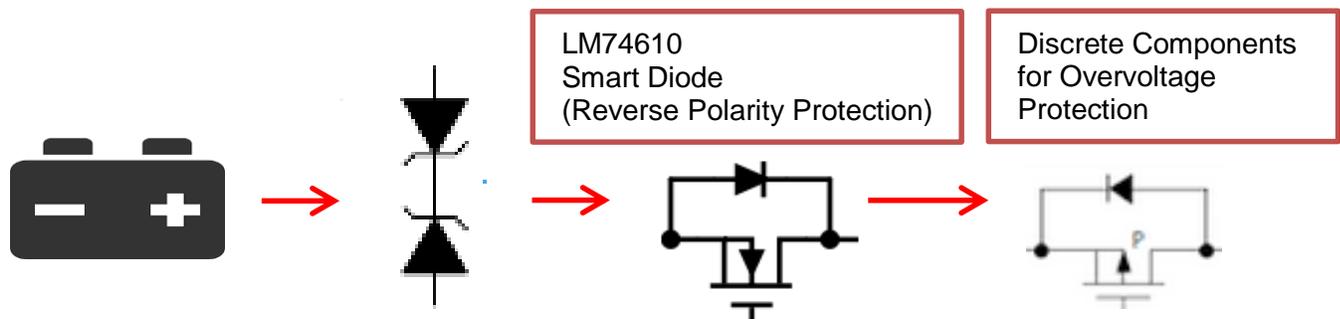

Vin Minimum	7VDC
Vin Maximum	35 VDC(OVP at 25V)
Vout1	12V
Iout 1	1A
Vout2	12V
Iout 2	5A
Protection	Input Overvoltage and Reverse Polarity

2. Circuit Description and PCB details

PMP10737 is a reference design that provides protection from reverse voltage (Smart Diode) and overvoltage using discrete components.

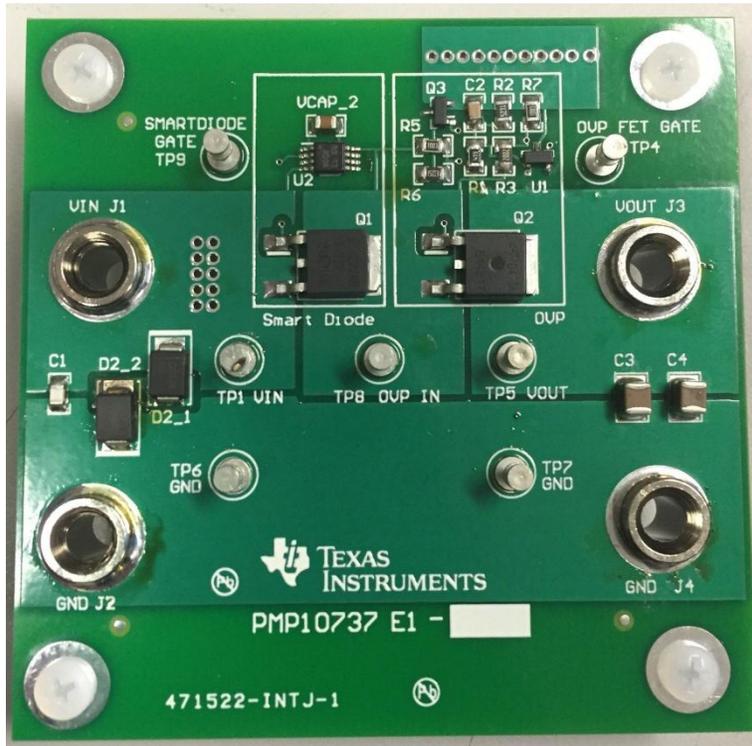

Input voltage range is between 7V to 35V with OVP at 25V.

LM74610 is used for Battery reverse protection which utilizes a charge pump to drive an N-channel FET to provide a resistive path for the bypass current to flow.

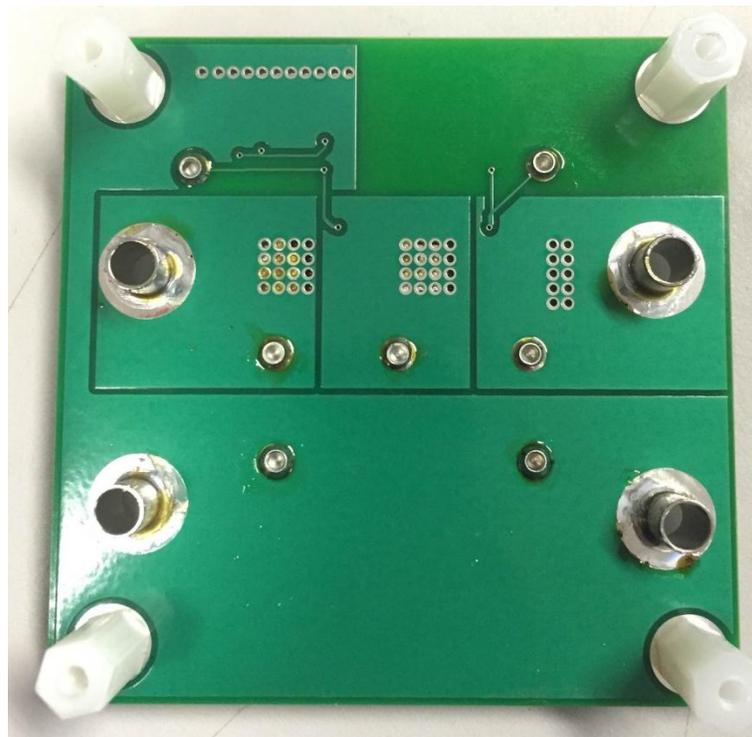

The Board dimension of PMP10737 PCB is 2735mil * 2700mil. Two layer PCB was used for the design.

4. Thermal Data

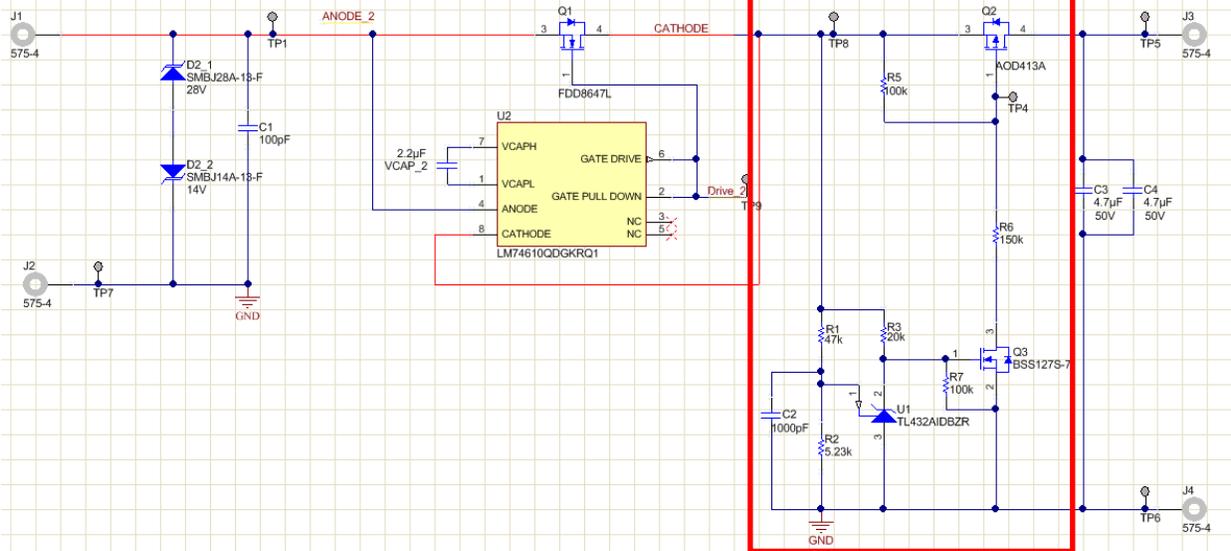

IR thermal image taken at steady state with 12Vin and 5A load current.

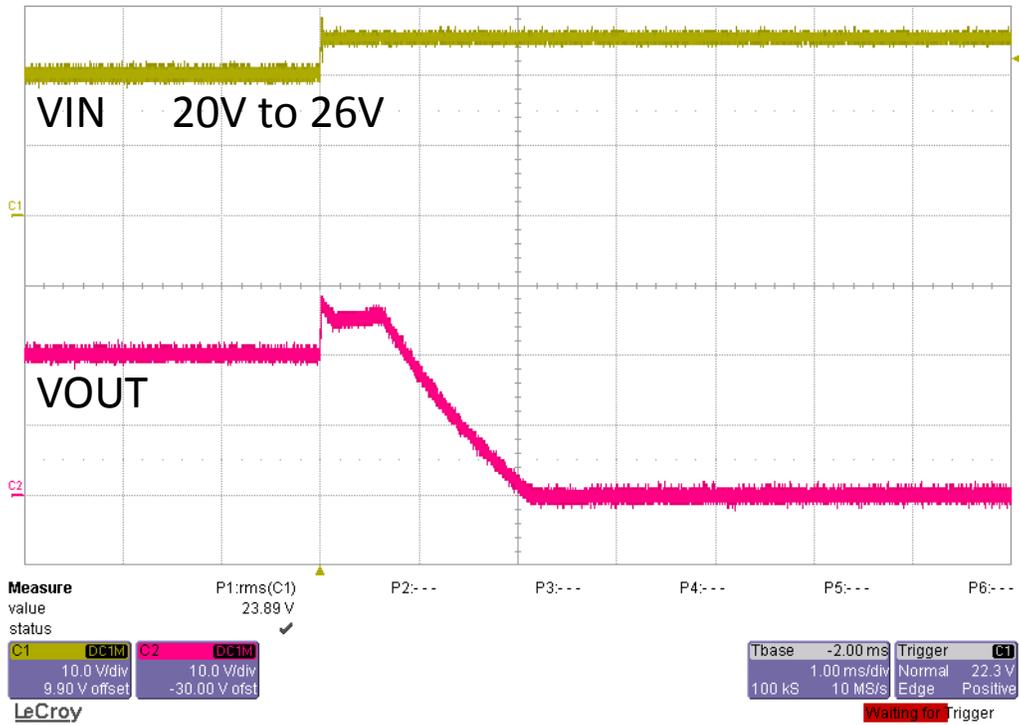

IR thermal image taken at steady state with 12Vin and 1A load current.

5. Waveforms

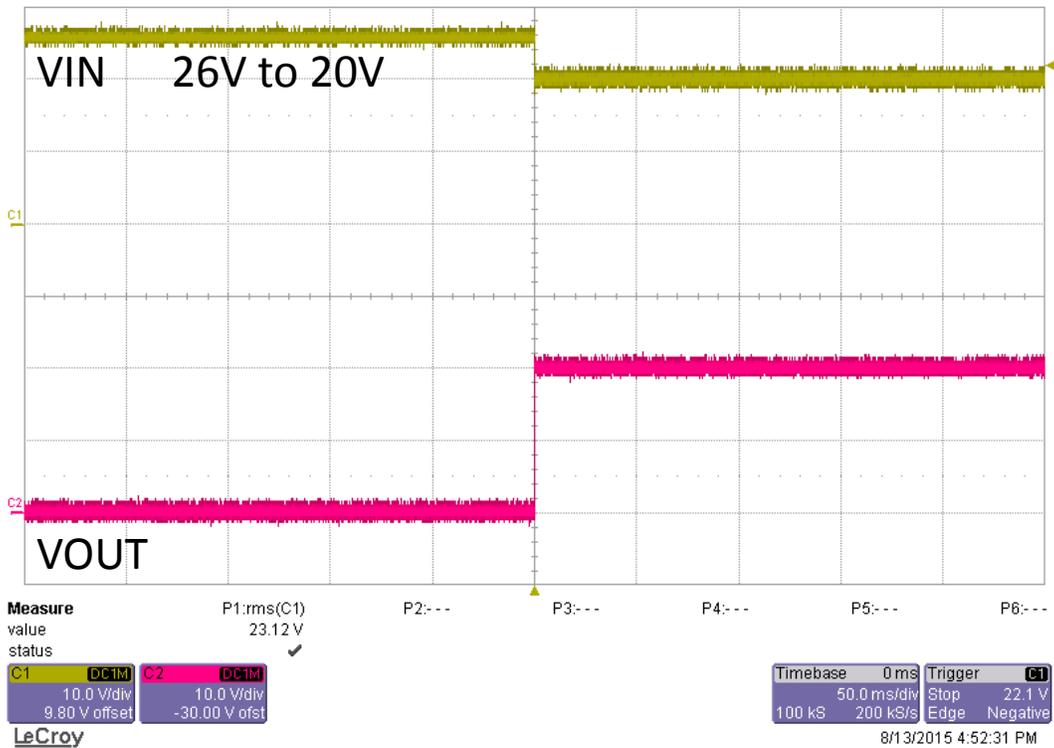

5.1 Input Overvoltage Protection

Discrete components are used for overvoltage protection. When the shunt regulator (U1) senses a voltage higher than 2.5V at R2, its output will go low which stops driving the N-channel FET (Q3). Q3 then acts as an open which ties the gate and source of the P-channel FET (Q2) together. The gate will not be driven which then prevents an output voltage. A timing capacitor (C2) is placed in parallel with R2 to prevent the circuit from outputting 0V when there are quick high voltage surges.

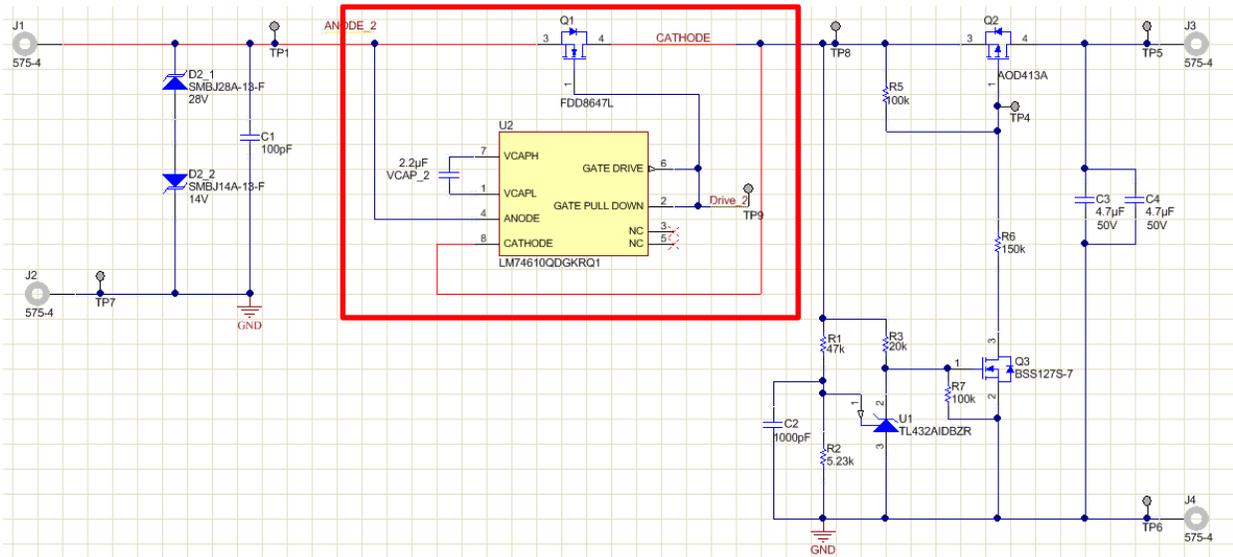

Transition to overvoltage condition. Protection at 25V.

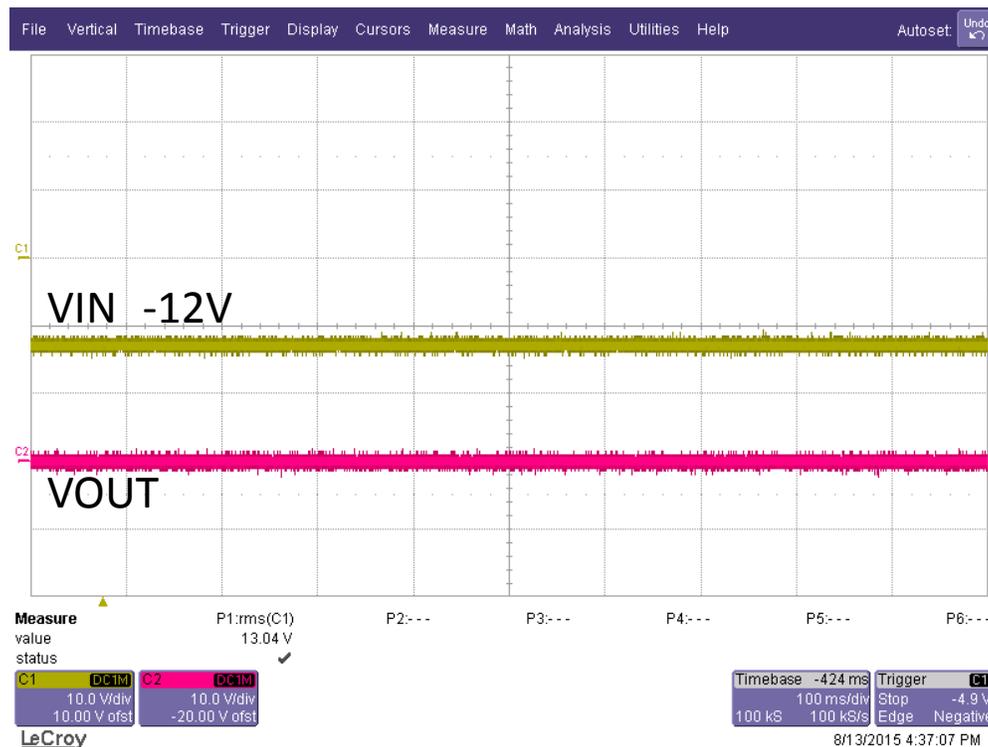

Transition from overvoltage to normal condition

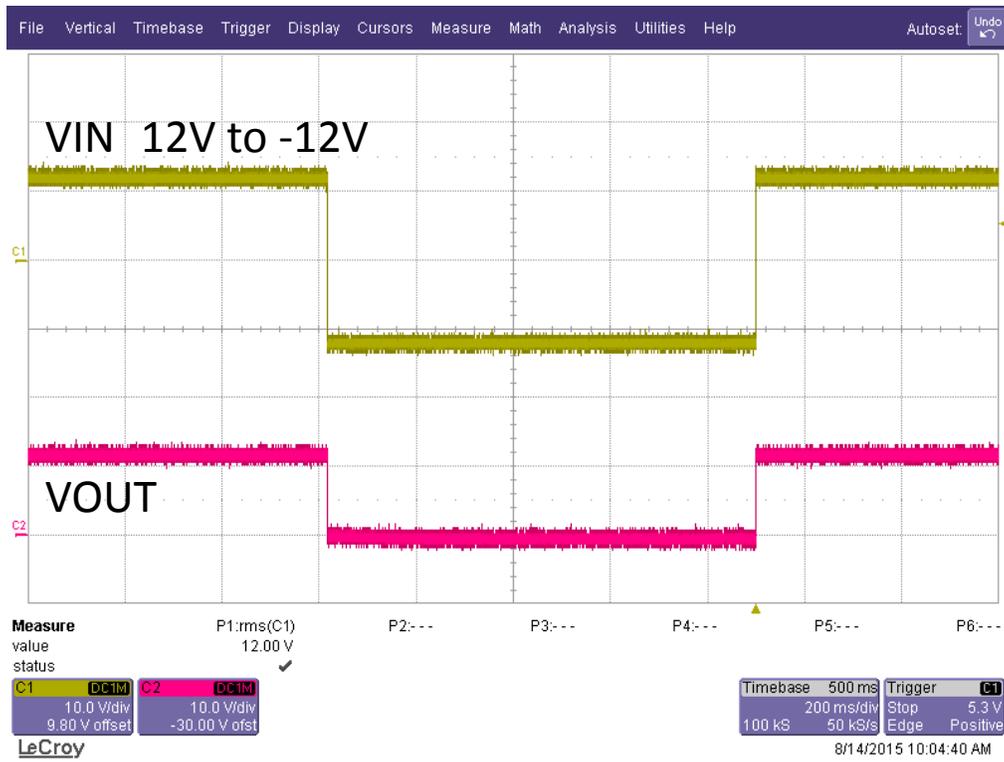

5.2 Reverse Protection- Smart Diode

The LM74610 Smart Diode is placed before the overvoltage protection for reverse battery protection. For more information on the LM74610 functional and electrical characteristics, see the LM74610 Smart Diode Controller data sheet ([LM74610](#)).
